EXTRACT

*From an Act prescribing Rules for the Government of the State Library, passed
March 8th, 1861.*

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 3, 1874.

VOLUME XXVIII
Number 1.

Snow-Shoeing in the Sierras.

[Written for the Press by C. W. HENDEL.]

Near the summit of the Sierra Nevada Mountains, on the borders of the counties of Sierra and Plumas, are the towns of La Porte, Howland Flat, St. Louis, noted during the "flush times" of California for their enormous yield of gold dust, and still retaining

depth in these high altitudes. It falls as much as 50 to 125 feet during one season in some places; though generally there is but little in the lower valleys.

When the snow attains a considerable depth in the Sierras, locomotion can only be accomplished by means of the celebrated "Norwegian snow-shoes," or "Norway skates," without which travel would be nearly imprac-

They are nearly of uniform width from end to end—a little wider, if any, on the front—and a spring is worked in, so that without weights they rest on the heels and points; but when the rider stands on them, the weight is somewhat evenly distributed, and a concave groove is made at the bottom, beginning near the toes and running to the heels, similar to the bottom of the skates. The bottoms are highly polished,

lower at back end than in front. On top of the shoes, a little back from the center, there is about 18 inches of wood left flat, and toward the front they are shaved and planed, tapering sufficiently to leave the point springy. There is considerable wood left behind from the center to the end, which makes the proper balance—little or no spring being required on the back part—the most essential being the front. The

SNOW-SHOE RACING IN THE MOUNTAINS OF CALIFORNIA.

fixed characteristics of the typical honest miner of '49.

The climate is very salubrious; most deaths occur from great intemperance, exposure, accidents and violence. The spring, summer and autumn months will compare favorably with the climate of northern Italy. The excessive heat prevailing in the valleys lasts for a few days, and only for a few hours during each afternoon. The winter months are often very severe, but even during the prevalence of the great storms, the cold is not so severe as in the Eastern States in the same latitude at a less altitude, while the snow falls to a great

height, since it becomes almost impossible to break roads or trails, where the snow often covers buildings even two stories high, so that people can only make their exit from their houses through the upper windows. It sometimes happens that a resident has to climb out through his chimney, after punching a hole through the snow above it.

Snow-shoes for traveling are from 8 to 12 feet long, $3\frac{1}{4}$ to 4 inches wide, and $1\frac{1}{4}$ inches thick in the center. They are tapered at the top from near the middle to one-fourth of an inch in thickness at the toes, and nearly flat. The toes are turned up like sleigh runners,

and tar is burned and rubbed in until a full, mahogany-like finish is obtained, which hardens the wood, makes a smooth surface, and attracts heat when exposed to the sun—the latter being a desideratum in putting on the "dope" when traveling.

Shoes made for racing are from $10\frac{1}{2}$ to $13\frac{1}{2}$ feet in length, from $3\frac{3}{4}$ to $4\frac{1}{4}$ inches in width, wider on the front part than on the back. Where the turn commences to the heel, or back end of the shoe, there is a fluted or concave groove about $\frac{3}{4}$ of an inch deep at the heel and tapering in depth from the turn at the point. This groove is about $1\frac{1}{2}$ inch wide, nar-

rower at back end than in front. On top of the shoes, a little back from the center, there is about 18 inches of wood left flat, and toward the front they are shaved and planed, tapering sufficiently to leave the point springy. There is considerable wood left behind from the center to the end, which makes the proper balance—little or no spring being required on the back part—the most essential being the front. The object of this is, that in running over rough places, there will be no sudden jerk endangering the equilibrium of the rider, who often attains a speed of 60 to 80 miles an hour on these shoes. They have a tendency to "buck" when going over uneven snow, and the rider often finds that they are as uncertain as all other things are here below. So great have been the improvements made in racing shoes, during the past few years, from the original style, first introduced 20 years ago, that they now appear to have reached perfection.

The rider stands a little back of the center,

[Continued on Page 9.]

The Emma and Eureka Mines.

Mr. Henry Sewell writes as follows to the Salt Lake Tribune in regard to the salting of the Eureka mine and the Lawrence-Whitney arrest:

I think it is high time that some one here should come forward and publish the facts about the Eureka mine, in order that Messrs. Lawrence & Whitney may have the benefit of the truth—whatsoever that may be in this case. Not having the honor of being an American citizen, I have hesitated to meddle in a matter which belongs exclusively to citizens of this Republic; but I cannot allow any longer such delicacy to prevent me from putting in a word in behalf of the accused, when the charge of "salting" the mine is so ridiculously absurd, and can only be the work of crazy, disappointed men.

I know nothing of the business of the Eureka mining company, and I am thoroughly ignorant of the value of its stock, and I don't want to know anything about either; but I wish it to be understood that what I am about to state is first due to the accused gentlemen; and secondly, it is just to the Territory that the charge of "salting" that or any other mine should never be permitted to go before the public without being met by flat contradiction, when it can be truthfully done.

Personally, without any remuneration whatever, I reported twice on the Eureka mine, at the request of my own personal friends here in this Territory, and I feel, therefore, at perfect liberty in consequence of holding no shares, or any interest directly or indirectly, to state that the accusation of "salting" the Eureka is as false as that brought forward by the celebrated pamphleteer, Paffard, of London, the Quixotic historian of the Emma mine, who stated that this great property had been "salted" in a most cute and mammoth manner by the Yankees, (and for the occasion); his crazy imagination gave to the world the elegant designation of "plastering." I have been so fully satisfied of his folly and nonsense, that I have, within the present week, also gone into the "plastered" mine, by the purchase of sixty shares; and my agent in London can visit the meetings with a little more than one solitary share and not a la Paffard.

Let the reader think of the work necessary to be done in "salting" or "plastering" a mine like the Emma. To accomplish such a feat would require the skillful labor of at least one hundred men for a period of two years. It would be necessary to sink about 400 feet and to drive several levels, then hoist all the barren rock to the surface, and then let down two million dollars' worth of ore to "salt" and "plaster" the vacant openings. It is not a little singular that the names of the two great accusers of the "salting" of the Emma and the Eureka should sound so much alike; they are a noble pair and will doubtless be handed down to posterity, should they not shortly reach a lunatic asylum, and then in sympathy for their misfortune, they could be passed by in silence.

It has become too much the fashion to write of "salting" mines in Utah, but every professional and practical man knows that of the many hundreds of mines that have been sold in this Territory, and the hundreds of others that have been offered for sale, there is only indubitable evidence of one solitary case where the dangerous business of "salting" a mine was really done. I think that the miners of Utah can congratulate themselves in not having figured with an aristocratic gigantic "diamond salting."

I have lived in this Territory nearly three years, and have visited all the mining districts repeatedly, and I think there are too many good mines here to tempt any sane persons to ply this unprofitable trade, the detection of which is as certain as day following night.

Unhesitatingly state that there are scores of experts and practical mining men who could testify that the charge of "salting" the Eureka is the most arrant nonsense that could be uttered. And it is the general opinion of the best informed here that the arresting of Messrs. Lawrence and Whitney is a "little game" to browbeat those gentlemen, and to place them before the court in such an unenviable light that the damages claimed may be awarded to their accusers. Directors of some companies when they find out that their own mismanagement, as well as that of their incompetent pet manager, produces a collapse and no dividends, get into the habit of seddling all the blame on the quality of the mines, and then their only recourse is to go for the vendors, accusing them of selling, or anything else to get out of the scrape. Finally, let me say, that to "salt" the Eureka it would require almost as many men, and as much time, as I have already stated would have been required to "plaster" the Emma. No doubt the miners of Tintic will come forward and disprove the charge of "salting" the mine, by which the accusers have made themselves so unpopular in that district. Let us stand by the right.

SALAD OIL AN ANTIDOTE TO STRYCHNIA.—A Queensland farmer has favored a provincial paper with the discovery that salad oil is an antidote for strychnia. In support of this theory, successful experiments on dogs are cited, and the enthusiastic discoverer writes: "So confident am I of the cure by oil, that I think I am only doing my duty by letting it be known that a gill of salad oil poured down the throat, if not too late in the application, is enough for a dog, and ought to be tried on a man."

The Signal Service Report.

The Chief Signal Officer of the Army has recently submitted a very gratifying exhibit of the labors of his bureau during the past year. Thirteen new stations have been added, so that at the present time there are seventy-eight points of observation in the United States, eleven in Canada, and three in the West Indies, the latter being located at Havana, Kingston, and Santiago de Cuba. Three other stations, on the islands of Porto Rico, Guadalupe and Barbadoes, will also shortly be equipped.

Some very excellent arrangements have been completed for securing to farmers and others, in communities not reached by telegraph, information as regards probable weather earlier than would be afforded were the reports delayed by publication in newspapers. The plan adopted has been to divide the territory of the United States into districts, each district having a distributing point, at or near the center, from which two printed copies of the synopsis and probabilities are forwarded by mail to all post offices within the districts, or which can be reached by sail, steamer, or mail coach by 4 P. M. of the same day. The bulletins are then conspicuously posted in the receiving offices, and 3,982 printed copies of the weather report are thus daily distributed to 4,491 post offices; and the plan thus far has worked admirably.

There are nineteen special river stations from which reports of the depth of water in the principal rivers of the United States are daily made by telegraph, at particular seasons during which danger from freshets may be anticipated. Twenty of the regular stations also furnish river reports, which are of great value as giving constant and accurate knowledge of the condition of channels, and thus adding to the safety and convenience of our river commerce.

For the purpose of studying the phenomena of the upper portions of the atmosphere, stations have been established on Mount Washington, N. H., on Mount Mitchell, N. C., and quite recently a third one on the summit of Pike's Peak, at an elevation of 14,216 feet above sea level.

One of the most valuable additions to the system, which have been made during the past year, is the establishment of a chain of life-saving stations along the Atlantic coast. Signals visible for some distance at sea, serving to warn vessels of probable bad weather, are to be displayed from points twenty-five miles apart from Sandy Hook to Cape May, and it is intended to continue the construction of suitable telegraphic communication along the dangerous coast of Virginia and North Carolina. Without doubt, these points of observation will be of great benefit. They will serve as meteorological stations from which information of the condition of the weather at the sea level can be transmitted; as sites for lighthouses and lifeboat deposits; as videttes in time of war, to give warning of the approach of an enemy's fleet; as a means of communication with vessels cruising along the coast; and as positions of display of cautionary signals, as already noted.

With reference to international exchanges of meteorological information, General Myer refers to the proceedings of the recent Weather Congress at Vienna. The proposition was adopted, by a unanimous vote of that body, that at least one uniform observation of such character as to be suitable for the preparation of synoptic charts should be taken, and recorded daily and simultaneously at as many stations as practicable throughout the world. It is also stated that arrangements have already been made with Prussia and Turkey to commence, on January 1874, the exchange of one daily report, taken simultaneously throughout those countries and the United States; and the co-operation of other nations in the system is expected. —*Scientific American*.

A LOST POPULATION.—About a thousand years ago, a colony of Icelanders was planted on this western coast of Greenland. They were hardy people, inured to cold and meager living, and there seemed to be no reason why they should not take root in the frozen soil of their new home. They built a stone church there and stone houses to live in, of which the ruins are still to be seen. But what became of the builders is a question that has never been solved, and never will be. They vanished from the face of the earth, and that is all that is known. Whether cold or pestilence or starvation took them off, or whether wandering savages killed them, no man can tell. Their settlement is known in history as Lost Greenland. —*Ind. Age*.

ADVERTISING MINERAL LOCATIONS.—Attention has recently been called to the decision rendered some time ago by Secretary Delano, in the case of the mineral location of Sierra Cañon, Placer county, California. In that case the publication of the mineral location had not yet been made forty-seven days in the county paper—the *Stars and Stripes*. When that paper discontinued publication, the remaining thirteen days, required by law, were filled off by continuing the publication in the *Placer Herald*. It was held that such notice was insufficient, and it is now observed that when newspapers cease publication advertisers must stand from under.

Base Metal Interests of White Pine.

Through the kindness of Thomas Wren, Esq., who have been permitted to see a letter written by Professor Clarence King, in which he alludes to the base metal interest of our district. A sample of the ore from the Imperial mine is to be forwarded to him immediately for analysis, and if the result will warrant, work will be commenced on several mines of the same character in earnest. W. D. Walbridge, a gentleman well-known as a successful miner of great experience in Idaho, California and Nevada, is now engaged erecting a furnace, of a new and improved pattern, at Oakland, Cal., with a view of purchasing base ores for reduction. Mr. King writes that if the experiment is successful, of which he has no doubt, the ores can be shipped to Oakland to be worked, or a furnace built here on the same plan, by payment of a royalty. At last we can see something feasible in this plan, and we have greater confidence in the enterprise from the fact of so successful and competent a gentleman as Mr. King recommending its practicability.

All that is wanted to make White Pine the leading district in Nevada is a successful means of reducing refractory ores, and it has only been a question of time and experiment to solve the problem. We have large quantities of sulphurets of copper in our mines, containing a large percentage of silver, which never have been worked successfully by the milling process, and would readily yield to treatment by smelting. Then the blue-stone which can be saved would return a profit by selling to mills in eastern Nevada, equal to the cost of reduction of the copper and the freight thereon. Our confidence in the future of this section remains unbroken, and every day evidences are being added showing our belief to be well-founded. With such men as Walbridge, with his extensive experience and fine business qualities, assisted by Clarence King, we are assured a success can be made in our base metal mines, and are satisfied the inauguration of this enterprise will be the means of attracting the attention of other equally reliable parties to our interests here. —*White Pine News*.

Eureka Mines.

A correspondent of the *Alta*, writing from Eureka, says:—Eureka still lives and promises to continue growing in prosperity. It has not attracted near so much attention or caused such excitement as White Pine and Pioche, but it will in a few years leave both of them behind—or I am no prophet. We have great bodies of ore here, with rare facilities for reduction. Excepting Little Cottonwood, in Utah, this is now probably the richest or the most productive of all the silver-smelting districts in the world. Our ores are carbonates, oxides and sulphurets of lead, containing from \$40 to \$150 per ton of gold and silver; and three or four tons of ore are smelted to get one of "base bullion" or impure lead, which contains from \$250 to \$400 of the precious metal in a ton. The base bullion is refined in San Francisco, New Jersey, Boston or other remote places.

The yield of this district for this year will amount to about \$3,800,000. Among the mines which have considerable bodies of ore in sight are the Richmond, Ruby Consolidated, Eureka Consolidated, Hoosac, Silver West Consolidated, and K. K. But many others are either known to be valuable or are very promising; though some may not be properly developed for several years. Various tunnels and shafts to give convenient access to good claims are now in progress.

We are at great inconvenience for lack of a railroad to Palisade. A company has commenced work on a narrow-gauge road from that place to Pioche by way of Eureka, and rumor says the Richmond company has made a contract for the transportation of its bullion for one year. That may look like a small contract to outsiders, but give us an iron track and you will be astonished at the amount of metal we can turn out in a day. A car-load a day from each of half a dozen mines would scarcely exceed the general expectation. There is no end to the ore beds of Eureka. Promises are made that twenty miles of the railroad from Palisade southward shall be in running order before March. It is our interest that the promises should be kept, and of course we believe them.

CARBOLIC ACID.—Carbolic acid is now so generally employed as a disinfecting agent, that a resume of the various forms in which it is made, in the largest establishment carrying on its manufacture in England (Calvert's), may prove of interest.

1. Solid carbolic acid of three different qualities, the point of solidification of which varies from 81° to 108° Fahrenheit.
2. Liquid acid of two different qualities, constituted almost entirely of creylic acid. According to Mr. Calvert, the disinfecting properties of the latter substance are the same as those of carbolic acid.
3. Soaps in which the proportion of carbolic acid varies from five to twenty per cent. according to the uses to which they are to be applied.
4. Disinfecting powder, composed of silicic and 15 per cent. creylic acid. The silicic is obtained from alum factories, where kaolin is treated with sulphuric acid. The disinfecting acids become thoroughly incorporated with it, forming a dry and pulverulent substance. —*Scientific American*.

Southern Mining Interests.

There is scarcely a doubt but that the entire Coast Range, from Santa Cruz county to San Diego and Lower California, abounds in precious metals, and only awaits the prying eyes of our indefatigable prospectors, to yield up their hidden treasures, and enrich them and add to the wealth of the counties by their development. Three or four years ago from the date of discovery chronicled of cinnabar, near Santa Cruz, to the mine of gold discovered in San Diego county, and in essaying from thirty to forty per cent. in this county, a spirit of inquiry and a desire to know more of our mountain ranges was felt, and a thorough examination began to be made of them. That the precious metals existed in paying quantities in many places in this county, was a fact well known, for as long ago as 1861, placer mining has been remunerative in Holcomb Valley, and in that locality there has recently been put up a new quartz mill, and the mine yielding fine returns for the capital invested. On Lytle creek remunerative placer mines give employment to a large number of miners. A ditch several miles in length has been brought into those mines, which cost many thousands of dollars, and hydraulic mining there has been and is now a success. Gold and silver have been found on the head waters of Rock and Gold creeks, facing the desert; they have been found northeast of the Comcongo rancho, on the Mojave, in the Black Hawk mountains, to say nothing of our famous Ivanpah mines; and the only tin deposits yet discovered upon the American continent are those at Temascal, in this county, and several others within a radius of thirty miles of San Bernardino. Since the first day of last January there have been discovered near the Twenty-nine Palms, gold and silver bearing mines, that from their immense ledges and richness of rock are believed to surpass any mines discovered upon this coast. One or two of these mines are now being worked, and the others being thoroughly developed. There is hardly a doubt but a six or ten stamp mill will be in operation there within five months. Our county has not been half prospected yet, although it contains a greater variety of minerals than any other in the State. In addition to our mining interests, we would state, for general information, that we have thousands of acres of vacant land, as rich as any in the State, not cursed with "land grant claims," and while incidentally prospecting for the precious metals, they can take up a homestead for their old age, and, when they are ready, settle down cozily upon a piece of land of their own, even if they make of it but a "chicken ranch." —*San Bernardino Guardian*.

EL DORADO MINES.—Correspondence from El Dorado county, Cal., to the Sacramento Union, says that considerable activity is manifested among miners. The prospect of a supply of water encourages prospecting, and new developments are being made. The El Dorado Water and Deep Gravel Mining Company are doing a large amount of work in repairing ditches, and more particularly in putting the Excelsior in proper condition for working. They intend to use 1,000 inches of water in the claim this winter. A large yield of gold dust is expected. In Placerville, a ten-stamp mill, owned by Blanchard & Co., has just been completed. Brewster, Blair & Co.'s quartz mill in Oregon Ravine, runs a portion of the time on custom work; their shaft is down some 300 feet in their mine, showing a wide ledge at the bottom. Mitchell & Halliway's quartz ledge near the court-house, lately developed, is remarkably rich. The owner of the Pacific mine and quartz mill, has made arrangements for starting the work again at an early day. Robinson & Co.'s gravel mill at Prospect Flat, is running full time, crushing about 70 tons every twenty-four hours. This claim comprises 160 acres. About two feet and a half of gravel taken 105 feet from the surface is crushed. Eight tons of rock from Gross' mine, on Big Cañon, crushed week before last, yielded \$173 per ton.

MONS. QUINQUARD says, in *Les Mondes*, on the respiration of fishes, that the quantity of oxygen absorbed is in proportion to the time; that the respiratory work of fishes diminishes with their weight; that species has but very slight influence upon the respiratory activity in consuming oxygen; that carp, weighing from 500 grammes to a kilogramme, breathe from seven to nine times less oxygen in a given time, in proportion to their weight, than man, and that fishes have, to a very slight extent, a sort of cutaneous respiration, which has been noticed by Humboldt and Provencal.

WOODEN PAVEMENTS.—In St. Louis, wooden pavements are voted a complete failure. The Mayor of that city embodied in a communication the results of civic experience during twelve years' trial of this kind of pavement. He says the fact is clearly shown that wooden pavements are not suited to streets used by heavy traffic, and it is expensive under any circumstances. He says that the average wear of such a pavement is six years, and the cost of repairing is one dollar and a half per lineal foot.

MINING DITCHES.—There are in this State 780 mining ditches, having an aggregate length of 4,888 miles and supplying 220,187 inches of water per day.

SCIENTIFIC PROGRESS.

Iron in Plants and Animals.

Every one is familiar with the important part that iron plays in the work-shops of man, but few are aware of the equally important part that it takes in the operations of nature—how it answers the same purpose in the minute cells of which all animal and vegetable growth is made, as the tools in the hands of the skillful worker. For, so far as our investigations have shown, iron forms no essential part of the plant or animal, yet without it all growth and assimilation cease. If seeds are placed on a little cotton wool in a solution containing all that is essential to plant growth, with the exception of iron, they will sprout and grow until the iron contained in the seed itself is exhausted; two plants then quickly bleach and cease to grow. If a little phosphate of iron, which is almost totally insoluble, is added to the solution, and occasionally stirred up so that it may be kept in suspension and thus come in contact with the roots, the plant quickly revives and continues its growth. Iron is an essential constituent of chlorophyll, the green coloring matter of leaves. Chlorophyll may be separated into at least two distinct bodies, one green and the other blue. Professor Horsford is of the opinion that this blue substance is vivianite, or phosphate of iron, and gives the following experiment in support of this opinion: He made a mixture of phosphate of soda and protosulphate of iron, and found that this mixture was capable of reducing carbonic acid to carbonic oxide, and that crystals of vivianite were formed in the operation. He therefore considers it probable that the formation of phosphate or protoxide of iron may be a preliminary stage in the production of vegetable tissue. There is also a well-known native phosphate of iron that is colorless when first mined, but on exposure to light it becomes a beautiful blue.

The amount of iron existing in plants is extremely small. Bonssingault found that it was more abundant in the oat than any other plant examined; but this contained only 131 parts in 1,000,000, while the white part of cabbage contained but nine parts, the green containing thirty-nine. It also abounds in plants that are almost perfectly colorless; thus mushrooms contain twelve parts.

Although found in all plants, and constituting an essential part of their food, it has never been thought necessary to supply it to them artificially, all soils being supposed to contain sufficient for their wants. But no one can have failed to observe the greater luxuriance of vegetation on the strong iron soils derived from the old red sandstone than on those granite soils which are comparatively free from it.

It was long supposed that the red color of the blood was owing to the iron contained in it, but Malder and Van Guodoever found that they could extract the iron completely from the red coloring matter without destroying it. Moreover, the blood of an oyster also contains iron, although it is perfectly colorless.

The want of iron in the system constitutes a disease which is well known to physicians under the name of chlorosis, and many remedies have been proposed for it. This want must generally arise from a defective state of the organs of assimilation; therefore it will be of little benefit to administer iron alone, without adding to it some other stimulating tonic. Various preparations of this kind have from time to time been offered, and among these the various combinations of iron and quinine have long held a prominent place. These compounds should all contain more or less of the metal in the form of protoxide, as the protoxide seems to be much more readily absorbed than the higher oxide; and they should be free from the well known ink taste generally possessed by all compounds containing iron.

The dose of iron should be small, and its use continued for some time. The amount which is necessary for a healthy man, and which he obtains from his food, is from .9 to 1.5 grains per day, and it is probable that the dose should not greatly exceed this amount.—*Journal of Chemistry.*

SILICON STEEL.—Mr. Calvin Pepper, an American experimentalist, claims to produce a true silicon steel by imbedding wrought iron bars in sand and subjecting them to a very high temperature, which causes the metal to part with its carbon in the form of carbonic oxide, and to take up silicon from the sand, thus converting it into silicon steel. The *Iron Age* remarks on the subject: "This, at least, is what we understand to be his claim, and as he asserts that he has accomplished what he claims, producing a true silicon steel by this method from wrought iron, we are not disposed to quarrel with his theory until we have had opportunity of examining his process and testing the metal produced."

In 1867 M. Rabuteau announced that the poisonous power of the metals was greater as their atomic weights were higher and their specific heats were lower. This he now substantiates by additional discoveries, among them the toxic relation of potassium and calcium.

It is said that when alcohol is taken internally, the temperature of the body sinks. With small quantities this lowering of temperature is 0.5° and somewhat more; in drunkenness a lowering of 2° has been noticed.

The Behavior of Metals under Stress.

Interesting and important results have been obtained in the course of the investigations in progress at the Stevens Institute of Technology upon the behavior of metals under stress. The testing machine invented and designed by Professor Thurston, with his automatic registry, was described in our issue of April last, and its peculiar value in detecting all phenomena of stress, and in affording a reliable and permanent record, is shown by inspection of the curves giving in the plate accompanying that article. The apparatus was exhibited at the last meeting of the National Academy of Science, which was held at the Stevens Institute, and its capability of revealing the action of molecular forces under stress was illustrated. At the close of the session a test piece was left in the machine, strained far beyond its limit of elasticity, to determine, if possible, the existence or non-existence of "viscosity" in the metals. After twenty-four hours, there appearing no evidence of further yielding, the distorting force was increased, when the discovery was made that the resisting power of the specimen had actually become greater during the period of rest under strain, and the pencil, instead of descending, rose until it indicated an increase of about twenty per cent. in the strength of the sample, and it then traced a path parallel with but above that of the previous day.

Repeated experiments confirmed this remarkable and important deduction of the experimenter: That metal strained so far as to take a permanent set, and left under the stress producing it, gains in power of resistance up to a limit of time, which in those experiments was about seventy-two hours, and to a limit of increase which has a value, in the best iron, of about 20 per cent., where the applied force is eighty per cent. of the ultimate breaking force. In other words, the metal develops nearly or quite its maximum strength long before reaching the point of rupture, instead of at that point, as when broken at once by a continually increasing stress.

This discovery was announced by Professor Thurston at the annual meeting of the American Society of Civil Engineers, November 5th, and the possible bearing of the earlier experiments of the Committee of the Franklin Institute on "Thermo-Tension," and of the well-known property of the increasing portative force of magnets under strain, as illustrations of related phenomena, were alluded to. The existence of this property had already been suspected, but it is evident that it could only be conclusively proven by apparatus embodying the principles of that used in this research.—*Journal of the Franklin Institute.*

NEW METHOD OF ENGRAVING.—J. Luther Ringwalt, of Philadelphia, patented, in July, a new method of engraving typographic plates, or pictures, on zinc, which he has successfully applied to the production of book and newspaper illustrations, ornamental lettering, miscellaneous job work, show cards, etc., varying in size and fineness from small vignettes to half-sheet posters. He recently gave a detailed description of his process at a meeting of the Franklin Institute, on which occasion he had drawn and engraved, in thirty minutes, on a prepared plate, a portrait of Dr. Franklin, of nearly life size. Under his system, a zinc plate is covered with a varnish capable of resisting the action of the acid, through which a series of lines are drawn by a ruling machine at such intervals as are required by the general character of the picture to be produced, thus opening up avenues in which the acid can make the desired incisions; the shape, thickness, position and direction of these lines or scorings being readily varied to suit different classes of work. The artist then draws upon this surface the desired design, creating additional blacks by applying a protecting liquid with a pen or brush at the points where additional blacks are required, and removing the original ground, with an etching point or scraper, from the places where additional whites are necessary. This operation involves but little more labor than the production of a drawing on paper, and the character of the engraving depends upon the degree of skill with which it is performed. The plate is next subjected to the action of the dilute acid, and at this stage a variety of tints can be produced by etching some portions of the work deeper and wider than others. The process is so simple and inexpensive that it could readily be applied in any printing office which can command art assistance.—*Newspaper Reporter.*

SMOKE CONSUMING.—Some interesting experiments were lately made in Ohio, with a view to ascertaining the best method of consuming the smoke of soft coal furnaces, and, after a careful examination and test of a number of mechanical appliances designed to effect this object, the conclusion was reached that nothing was so simple and effective in preventing the escape of smoke as the introduction of sufficient oxygen into the furnace to effect complete combustion of the fuel, and thus prevent the formation of any smoke at all.

A NEW EXPLOSIVE.—Ozobenzin is the name given by MM. Houzeau and Renard to a new explosive substance. It is produced by acting upon benzine, boiling at 81° cent., with concentrated ozone; formic and acetic acid are produced, and a gelatinous precipitate formed, which, being dried *in vacuo*, becomes a white solid, which is the explosive compound named. It detonates violently when struck or when simply heated. It is unstable in the air; water decomposes and dissolves it.

MECHANICAL PROGRESS.

Small Motor Machines in Europe.

The demand for an economical and convenient small motive power is felt and appreciated throughout the civilized world. In this country we have several patented inventions in this field, utilizing steam, hot-air, gas and water, as the means of generating or conveying the force. We have also devices for storing up force where very small power is required, as for sewing-machines, some storing the power in a wound-up spring, a weight, in compressed air, or in a vacuum cylinder.

Of the principal devices for small motive power in Europe, and exhibited at the Vienna Exposition, may be mentioned the following: Messrs. Otto & Laagen, in Germany, and M. Lenoir, in France, make a machine which is driven by the explosive force of lighting gas; Mr. W. Lehman, in Germany, constructs a hot-air machine which claims to be an improvement upon the idea of our American engineer, Capt. Ericsson; while M. Hermann La Chapelle, in Paris, and others more conservative, build diminutive steam-engines.

The gas-engine of M. Lenoir in external appearance resembles a horizontal steam-engine, and indeed is nearly the same internally, having the same parts, piston, cylinder, valves, etc., but the power is obtained by exploding a mixture of gas and atmospheric air in the cylinder. During the first half of each stroke the piston sinks into the cylinder and gas in the right proportions. At the half stroke the mixture is exploded by an electric spark, which forces the piston through the remainder of the stroke.

Messrs. Otto & Langen's machine consists of an upright cylinder, open at the top, in which plays vertically a piston having a ratcheted rod, so arranged as in the down stroke to engage a cog-wheel, attached to the axle of the fly-wheel of the machine. The piston, during a small portion of its upward course, takes in the right proportioned mixture of gas and air, which is exploded at the point of the piston's course, where the mixture is shut off. Explosion of the mixture carries the piston upward until the pressure of the external atmosphere stops it. The explosion, depending upon expansion of gases by heat at the instant of combination, is immediately followed by a condensation and partial vacuum in the cylinder. The pressure of the atmosphere upon the piston forces it downward, and the ratcheted rod, engaging the cog-wheel, imparts this force to the fly-wheel. It is claimed for this machine that it is much more economical of gas than M. Lenoir's. The complications incident to the ratchet and cog-wheel arrangement are objectionable; but it is spoken of as having quite an extended use. The consumption of gas is about a cubic meter (39.31 cubic feet) per horse-power per hour. With gas at \$3.50 per thousand this would give nine-six cents per day per horse-power.

Of the small water motors, that of Mr. Schmid, in Zurich, a small oscillating water engine is well spoken of. It is on about the same principle as the oscillating steam-engine; having, of course, much larger valve-ports. It hardly need be remarked that the water-engine can only be used where a small supply of water with considerable head is at hand, as is the case in cities where the cost of water is not too great. In Zurich, where the water is supplied by a pump, worked by eighty horse power, the Schmid engine has come quite extensively into use.

The water column motor of Mayer, in Vienna, also designed for light work, is in principle like a horizontal steam-engine. The arrangement of the regulator and air-chamber, for the purpose of avoiding the hydraulic shock incident to such engines, is quite ingenious. The machine requires more space than that of Schmid's.

The small turbine wheels of Messrs. Escher & Wyss, and of Mr. Gwynne, are also designed for the utilization of power furnished by a water column on a small scale.

The hot-air machine of Lehman claims to have an advantage over the Ericsson engine in an arrangement by which the air in immediate contact with the piston is never heated above 300° Cent. (560° Fahr.), thus saving the packing and lubricating material of the piston. Beyond this advantage it is not easy to see the superiority.

Then come the small steam-engines of M. Herman La Chapelle, in Paris, which have nothing remarkable about them, except that they are small and well made. It is very questionable whether, when people come to learn that small steam-engines can be made perfectly safe, and can be run without any extraordinary skill or judgment, the advantages of all the so-called improved motors will seem so great as at present. For most cases where small motive power is needed, the small steam-engine, if well devised, and well made, is the cheapest and the best.—*Artisan.*

It is stated that the quantity of coal necessary to raise a million gallons of water 100 feet, varies in England from 17 cwt. to 114 cwt.; this is said to be due to the varying qualities of coal used, but more particularly to the construction of the pumping engines.

Two monitors are being constructed at Bremen for use on the Rhine. They are covered with a one inch plating—a sufficient protection against infantry fire, and, it is thought, against field artillery. They will draw only five feet of water.

Sand Blast Engraving.

The *British Trade Journal* seems pleased with Tilghman's contrivance for engraving on glass, by means of sand blast. It is a Philadelphia invention, lately on exhibition at the London International Exhibition. The principle of the apparatus is by a blast of air, steam, &c., to cause innumerable particles of sand to impinge where portions of glass, stone, metal, &c., are to be removed. Mr. Tilghman is thus enabled to produce not only excellent work, but with a rapidity almost incredible. For example, a square or triangular hole of half an inch in the side can be bored through a sheet of ordinary plate window glass in less than one minute. Designs of lace work—also photographs—can be "eroded" or "ground" on glass with great rapidity.

There are two machines now in operation upon glass, and one at work on stone. The small machine is to appearance a very plain painted box or stand—nothing of machinery visible. In the top of this box are two holes, about an inch and a half in diameter. If the wooden casings were removed, there might be seen below these holes a pipe, which descends, and is formed somewhat trumpet-mouthed on the outside of the bottom of the box. Below this month is a trussed wooden basin. From the upper part of the box, on the spectator's left hand, a pipe passes underneath the floor to the center of a rotating fan, near the wall of the room, and therefore by this a vacuum can be formed in the box. As the only inlet of air is past the trumpet mouthed opening, a rapid current ascends the pipe connected with it whenever the exhaust-fan is at work. From large hoppers (funnel-shaped) containing sand, a regulated quantity falls toward the turned wooden basin; in falling on the basin it is influenced by the entering air, is jetted from the pipe, and so strikes upon, say, glass covering the holes; the exposed glass is rapidly depolished. Where, however, an elastic substance as paper, India-rubber, etc., covers the glass, no action of sand takes place.

If interstices or openings be formed in this elastic substance, as a pattern, then the surface of the glass is removed in accordance with such pattern, and to a depth dependent upon the time of exposure, and the intensity of the current of air, and quality of the sand.

Next to this small "vacuum" machine is a large compressed air-blast, one capable of acting upon a sheet of glass three feet broad. A design in paper or lace being pasted on the glass, it is laid upon endless bands, by the motion of which it may be carried forward. In the middle of the compartment (which is glazed upon one side so that spectators may see the operation) provision is made, by a suitably-formed transverse opening, for a blast of air with sand. When the ordinary machinery is set in motion this blast commences, the glass is traversed at a pre-arranged velocity, and in as little time as one may require to read this account the ornamented glass is delivered at the side of the box opposite to that at which it entered.

So slightly an elastic surface as the changed character of some of the materials used in photography suffices to resist the action of the sand; hence the photographic design may be etched by sand on glass. Examples of various works done by this process are on the table near to the machine. The third machine is in a separate building. It consists of a wooden table, on which the stone is laid. This table can be traversed impulsively in one direction, by the action of a Clement's driver, on a spur wheel, and so motion is given to a rack.

Above the table provision is made for traversing the combined steam and sand jet. This is accomplished by a mangle-wheel motion, variable according to the breadth of the stone to be operated upon. By these two motions, transverse to each other, every portion of the stone may be reached. The steam and sand jet is arranged upon the plan adopted by Mr. Siemens, for exhausting the telegraph dispatch tubes—the sand being admitted by an inner small tube, surrounded by jets of steam, as from concentric rays of an argand burner. Whilst the writer was present a delicate and somewhat intricate pattern was laid upon a piece of marble. The steam in the boiler was at 55 pounds pressure. In five minutes the marble, measuring thirteen inches by six inches, was penetrated to a depth of about three-sixteenths of an inch, leaving the surface as originally polished, and with the beautiful tracery design in high relief.

CIRCULAR LITHOGRAPHIC STONE.—Mr. C. Maurice, of New York, has invented a form of lithographic stone for direct printing, which promises to effect a complete revolution in the art. He boldly discards the ordinary flat stone, and by the use of diamond stone-working machinery produces a solid cylinder, from which, of course, impressions may be taken with greater facility and rapidity.

In Paris the story goes that the old sardina boxes are gathered up by rag-pickers and sold to builders, who fill them with mortar and use them in the construction of cheap dwelling houses. Where is the economy?

WHEAT CLEANING MACHINERY.—The agriculturists of South Australia have resolved to offer a first prize of £1,200, a second of £600 and a third of £300, for the best wheat cleaning machinery.

SMITH & WESSON's establishment at Springfield turns out over 300 revolvers daily.

MINING SHAREHOLDERS' DIRECTORY.

NOTE.—In the Stock Boards an assessment is delinquent thirty days from the date of levy, exclusive of interest.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

acter of rock is taken out that was found above, "lousy" with gold. If the same character of rock is obtained for twenty feet more, we understand that a mill will be erected immediately, and work will be commenced in dead earnest. The prospective outlook for quartz mining was never so bright in this vicinity as now.

The new mine of Messrs. Brewster & Sheperd is rapidly being fully developed, and looks better and better each day. It is undoubtedly the richest quartz vein yet struck in this part of the State.

Work is progressing on the Gross and True ledges, over in Big Cañon, and both ledges continue to look encouraging. One or both of these ledges will have a mill upon them before another winter. The Gross ledge has now a large amount of rock in sight that will work from \$30 to \$50 per ton, and there is no reason to doubt that it will eventually be one of the best paying mines in the district.

INO COUNTY.

NOT AN ENTIRE SUCCESS.—*Independent*, Dec. 27: We are sorry to learn that some of the plying of the Cerro Gordo Water Works gave way under the immense pressure to which portions of it were subjected, so that the grand nomenclature of Cerro Gordo's hopes is not yet realized. As the work in all other respects is substantial success, this weakness of a few pipes is a matter of small consequence—quite different from the possible inability of the engines to raise the water such an immense height, but they send it up without the least difficulty.

MARIPOSA COUNTY.

NEW DISCOVERY.—*Gazette*, Dec. 27: From Mr. H. B. Silver, Superintendent of the Francis mine, we learn that on the lower level of the Francis mine he has discovered a very rich chute of ore, about a foot thick, which is literally lousy with gold. Men are now at work sinking on said new discovery, which is increasing in size as they sink on it.

THE FRANCIS MINE.—Last week we stated, on what we considered reliable authority, that the Francis Mining Co. had suspended work on their claim. Since then we received the following communication from the Superintendent:

"DEAR SIR: I perceive in your issue of the 16th inst. there is a statement to the effect that work has again been suspended on the Francis mine, the owner finding it unremunerative. Where you got your information from I do not know, but wish you to correct the above statement, as it may work injury, perhaps on your part unintentional, to the present owners."

NEVADA COUNTY.

ALLISON RANCHO MINE.—*Union*, Dec. 28: We learn from good authority that the Allison Rancho mine will be started up again early in the coming year. With the "Rancho" will be started the first extension south on the same ledge. The management of the new start will be prepared to find gold or the clinders down toward the center of the earth. There are several other idle mining properties in this district which should be started and which will eventually pay.

PLACER COUNTY.

LINCOLN COAL MINES.—*Herald*, Dec. 27: This mine is now pretty thoroughly opened. Hoisting works are completed. A force of men are employed in the mine, and large quantities of the useful and valuable mineral are being brought to the surface. We have before us some fine specimens of this coal; we have tried by experiment the combustible properties of the article, and find it burns readily. It certainly is valuable, but to what extent remains partly to be known. Shipments have already been made to Sacramento, and parties there, supposed to be capable of judging, after testing its properties, speak very favorably of its qualities. This discovery promises to be of no small interest to the country, as the working of these mines will give a new impetus to the lower part of the county, which will redound with good results to all.

SAN DIEGO COUNTY.

JOHAN.—Correspondence *World*, Dec. 20: I visited the Stonewall mine to-day and found it in a very flattering condition. The storm has had the effect of saving an immense amount to the proprietors from the fact of its caving in the large opening from the surface to the first level, which also has disclosed an immense amount of very rich ore. The mill is kept running constantly day and night on very good average rock. The yield is very handsome. The proprietors are in very good spirits on account of having such a large body of water in the laguna, which will last them six or eight months, even if it should happen not to rain another drop the whole season.

SIERRA COUNTY.

GOLD BLUFF.—*Messenger*, Dec. 27th: The Gold Bluff Mine was sold at Refore's sale, last Saturday, and purchased of Mr. Behm for \$7,000.

WATER SEASON.—The coming season bids fair to be one of the best for water that we have had in a long time. The large body of snow is thoroughly saturated with water, besides which the ground is full. It is years since we had such large quantities of snow in as good condition as now for making water, so early in the season.

TUOLUMNE COUNTY.

THE FIRST CLEAN UP.—*Independent*, Dec. 27: Was had at the Alpha T. M. Gravel mine on Friday last, and the result was equal to a reasonable desire. The best of gravel is widening and improving. A force of ten hands is at

present employed, and more will be added as room is made for them to work. The company will put up a mill in the spring.

The quartz mill at Spring Gulch is now running night and day, having plenty of water.

A large force of men will start for the mountains, as soon as the weather permits, to repair the flume of the Water Co. at Rocky Point.

EXCELLENT rock comes from the new 70 foot level of the New Albany mine, bearing pure gold, sulphurets and galena.

Nevada.

ELY DISTRICT.

ALPS.—*Record*, Dec. 20: The drift from the bottom of the shaft is in 530 feet.

BOWEN.—Getting ready to drift as fast as possible, and expect to start in within a few days.

CONDOR.—Still drifting for the ledge, with good indications. Small stringers or seams of ore are found in the face of the drift.

HORN AND HUNT.—Pushing the main drift ahead, and the work is being carried forward rapidly.

HAVANA.—Down 267 feet, and still sinking. Struck the pay streak mentioned on Thursday about six or seven feet from the bottom of the present shaft. The vein has increased in width until it is now 12 feet wide.

LOUISE.—Ore from this mine is being milled, and pulp assays average about \$147.

MEADOW VALLEY.—No. 3 shaft is now 92 feet below the tenth station, and it will not be long before another station will be made. The drift from the tenth station, running west, is in 50 feet. The east drift on the ninth level is in a distance of 387 feet, and is being rapidly pushed ahead. The east winze from the eighth level is down 54 feet. The east drift on the 520-foot level is still being continued, and is in 332 feet. The snout shaft is down 881 feet.

Running a cross-cut south to connect with the west drift of the eighth station, No. 7 shaft.

NEWARK.—Now working on the 600-foot level, and a marked improvement in the mine has shown itself during the week. The Newark has a ledge about 20 inches in width, with ore which it is believed will yield from \$200 to \$250 to the ton. It is thought the ledge on the 700-foot level will be cut in about 25 feet more.

PAGE AND PANACA.—Work in this mine is going on satisfactorily, with an addition recently to the force of men. Work is pushed ahead night and day. We saw yesterday some very rich ore from Page & Panaca, which was taken from the Gussie, a ledge struck less than two weeks ago, and which has since been recorded by the Superintendent for the Page & Panaca company. The ore in this ledge is increasing in quantity and improving in quality. The Page & Panaca has the great advantage of an abundant supply of water for use in the boiler, which saves an outlay of \$400 or \$500 per month. The mine looks well throughout, and is being worked vigorously and economically.

PIOCHE.—The new works, near the old Burke shaft, are about completed, nothing being left to be done but to put in the flooring. The building is a frame work, 48x75 feet in dimensions. The castings were all made at the foundry of the Nevada Central Railway, Bullionville, and are equal to any cast in San Francisco or the East. Steam started up for the first time on Friday, and it was found that the machinery worked to the entire satisfaction of all. The engine was used to draw up from the railroad track, about 200 yards below the works, the 750 feet of wire rope to be used in hoisting. The rope has been placed upon the reel, and all is now about ready to begin hoisting. The entire works are very substantial, as much so as any in the district. The engine rests upon the bed rock, and is 30 horse power, and a very superior piece of machinery. A blacksmith shop is also connected with the works. A contract has been let to sink the shaft 246 ft. further, which will make 660 feet in depth. Sinking will commence to-morrow. T. R. Butler will have charge of the Pioche during the absence of Mr. Nelson, present superintendent.

WASHOE DISTRICT.

AMERICAN FLAT.—*Gold Hill News*, Dec. 27: Driving the main southwest drift on the 400-foot level is making good progress. No cross-cutting yet.

ARIZONA, UTAH AND GLORE.—The face of the main west drift is still in quartz of a very favorable character. An ore chute for the extraction of ore through the main incline, is being erected. The prospects for the development of pay ore in the south drift, from the bottom of the incline, are good.

BELCHER.—Daily yield, 450 tons of ore. The ore breasts and stopes throughout the mine never yielded better or looked more flattering than at present. The main south drift from the Crown Point, on the 1,300-foot level is in 535 feet, still in quartz. The north drift on the 1,300-foot level, from the main incline, is in 272 feet and will make connection with the south drift from the Crown Point in about ten days more, thoroughly ventilating that level of the mine and affording the long desired opportunity of hoisting their ore through the company's own shaft. The timbers for the 1,400-foot station, in the main incline, are in, and a drift just started. The winze from the 1,200-foot level and the up-raise from the 1,300-foot level, have also made connection.

CROWN POINT.—Daily yield, 400 tons of ore, which is being extracted from the 1,200 and 1,300-foot levels. The ore stopes and breasts on both these levels are looking well and yield-

ing finely. The main south drift on the 1,400-foot level is being driven rapidly ahead, the face in rich ore. Breasting out and extracting ore from this level will be commenced as soon as the main drift has reached the Belcher level. The main south drift, on the 1,500-foot level, is making steady progress; the flow of water from the face continues strong, keeping the pumps steadily running. The vein matter, in the face of the drift, shows every indication of another rich level, when the main ledge shall have been reached and opened.

CONSOLIDATED VIRGINIA.—Daily yield of ore, 260 tons, being all that the mills now employed by the company can crush. Average yield of ore crushed by the mills during the past weeks, \$81 per ton. The north winze, on the 1,200-foot level, is down a perpendicular depth of 140 feet, the entire distance in rich ore. It was the intention to commence cross-cutting in this winze at the depth of 100 feet, but the ore steadily increasing in richness, has caused a steady prosecution of the work of sinking instead. Many of the assays for the last few feet run high into the thousands, while the average for the past week, has been over \$200 per ton. The up-raise from the 1,200-foot level is up 137 feet, also in rich ore. The main east drift, on the 1,000-foot level to connect with this raise, is making fine progress having only about 40 feet more to run to make the connection, which will then give good ventilation to the 1,200-foot level and greatly facilitate the work throughout the mine. The south winze at a depth of 80 feet, has passed through the ledge and struck the west clay wall, and at the same time tapping a heavy flow of water, which in a few minutes, drove the men out and stopped the prosecution of the work in that quarter for the present. The new station at the 1,300-foot level, is opened and a main drift started for the ledge, which is being prosecuted with all the vigor possible.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore, the assay value of which is \$30 per ton. There is but little change of importance to note in either the quality of ore extracted or the general appearance of the ore-producing sections of the mine. The main south drift at the third station has shown but little change during the week.

CALERNIA.—The principal part of the week has been spent in draining the water in the shaft between the 500 and 600-foot levels. The water is now completely drained below the 600-foot station, and some necessary repairs are being made preparatory to resuming work on the lower levels. The drain tunnel is in 300 feet, making extraordinary good progress.

GOULD ANN CURRY.—The main east drift, on the 1,500-ft. level, is being driven ahead with all possible vigor, the face still in very promising ledge matter. The main east drift on the 1,600-ft. level, is also making good progress. The rock in the face of the main east drift on the 1,700-ft. level, is getting much softer, indicating a near approach to the west wall of the ledge.

HALE & NORCROSS.—Sinking the main incline is making fair progress, the rock in the bottom blasting finely.

IMPERIAL.—All work in the mine is suspended for the present, for the purpose of putting in a new, heavy gear wheel and hoisting reel.

JULIA.—The water is drained to below the 1,000-ft. level, and the main drift on that level is being repaired preparatory to driving it ahead and opening the body of ore developed at the time the men were driven out by the water. The main south drift, on the 900-ft level, is being steadily driven ahead with excellent prospects of good ore developments soon.

OVERMAN.—There is no change of value to note in the main west drift on the 1,200-ft. level, except a steady increase in the flow of water from the face. Cross-cutting and prospecting are being prosecuted as usual on the 1,000-ft. level.

OPHIR.—The ore development in the south drift on the 1,465-ft. level continues to show a steady improvement as the work advances, and there no longer seems to be a reasonable doubt of the permanency of the new discovery. The main south drift on the 1,700-ft. level is still driven vigorously ahead with but little change to note, except a slight increase in the quality of water.

SUTRO.—The main south drift is in 197 ft. Ore constantly improving in quality. A large stream of water encountered in this drift keeps the pumps actively employed. The ledge looks finely, and the prospects as regards the permanent value of this mine are very encouraging.

SAVAGE.—Sinking the main incline is making good progress. The main east cross-out, near the north line, is still being pushed vigorously ahead.

SIERRA NEVADA.—Daily yield, 60 tons of ore, keeping the company's mill steadily running. The ore stopes and breasts are both looking and yielding well as usual. The up-raise from the main tunnel, in the old Sacramento ground, is giving promise of the development of a body of good ore, which, if it proves of sufficient extent, will soon enable the company to again start the old Sacramento mill. Sinking the new shaft is making fair headway, the rock in the bottom blasting finely.

SILVER HILL.—The water has almost entirely subsided in the shaft, and good progress is being made with the sinking. The main south drift at the second station is being pushed steadily ahead, the ore in the face showing spots and streaks of exceeding richness and promising a development of extraordinary value. The main north drift at the second station during the week made connection with the north winze

near the Justice line from the first level, giving a much needed circulation of pure air and greatly facilitating work in that part of the mine.

TYLER.—The main west drift at the 200-ft. station, is still driven ahead at the rate of 2½ ft. per day, the face of the drift in porphyry. The main east drift is in 185 ft., the indications of soon reaching the main ledge being excellent.

UTAH.—Driving the main west drift at the lower level to tap the ledge is making good progress. The last 32 ft. has been in clay which is supposed to be the east wall of the ledge. There is a light though steady flow of water from the face of the drift.

Colorado.

SAN JUAN DISTRICT.

Correspondence of *The People*, Dec. 19: Since my last writing I have made a "flying visit" to Aioimas mining district (San Juan.) I visited the famous Green Mountain, and in company with two others, took out about 800 or 900 pounds of the richest silver ore I have ever seen. We left the mine showing a vein of about five feet of mineral, with nineteen inches of gray copper, worth from \$2,500 to \$3,000 per ton. The Mountaineer, also, is similar, perhaps as rich. The Little Giant I found being vigorously worked, showing a vein of about four feet, with a streak of about eighteen inches of the same dark-looking stuff that it has carried from its first opening, and which pays several thousand per ton, in gold. The Dexter and Central, owned by Johnson, Blair, and others—original owners of the Little Giant—may also be put down as among the "first-class." I also visited the "La Plata," a ledge discovered by George W. Hartman, a day or two before I arrived in the mines. The ore in this ledge resembles some of the Georgetown mines. It shows between four and five feet of sulphurets of silver. Assays show from 242 to 900 ounces per ton, silver. I understand since my return that he has sold the mine for \$15,000 to parties in Chicago. The Dexter and Central lie within one thousand feet and cross the Little Giant; yet while the Giant is entirely a gold ledge, they are silver. The McGregor, owned by Robert McGregor, is another of the many in that district, (in fact, I may say hundreds,) which may be put as first-class.

Lower California.

JAPA.

THE MINES.—*Cor. S. D. World*, Dec. 20: The Northwestern Gravel Range is all gold, and averaged, as far as I've prospected (several miles) uniformly the same; and the best pay dirt is from ten to fifteen feet deep, the latter worked by a party from whom no tidings had been heard for some time, and whom we found prospecting the field already mentioned. In my opinion the gravel range is the gold belt. It runs wash gravel, with wash quartz, boulders, and blue dirt. Some places are covered with a cap of granite, with an underlying stratum of blue granite, and slate bed rock. There is plenty of water by digging for it.

Montana.

THE GALLATIN SILVER MINES.—*Montanian*, Dec. 20: Development is being energetically pushed, on some of the Sixteen Mile creek silver veins. They are about 45 miles north-east of Bozeman. Some of the Sixteen Mile ores are said to be fabulously rich, running up into the thousands per ton. The ledges vary in width from 2 to 35 ft. The general formation is lime, slate and quartzite.

THE MCCOOK MINING EXPEDITION.—General McCook, who was shot and killed, three or four weeks ago, in an altercation in Yankton, Dakota, was at the head of an extensive exploring expedition, organized for prospecting in the Yellowstone valley next summer. The general was in possession of several tons of very rich gold quartz, said to have been obtained in the Yellowstone valley, 250 or 300 miles above Bismarck, and an excitement had been raised at the time of his death which promised to rival the Pike's Peak excitement in 1859.

Utah.

LITTLE COTTONWOOD DISTRICT.

MINING.—*Oor. Tribune*, Dec. 24: Our mines continue to prosecute work without interruption by the storms. There are no new strikes reported. The Emma, as usual, is working the second class dumps, and is also taking out ore from the rich strike made lately in the bottom of the mines. The Flagstaff has shut down for a short time, for the purpose of squaring up its accounts, and to give the new management ample time to prepare everything to run the mine in a more economical manner. The Davenport mine still remains in the possession of the Sheriff, but it is rumored on our streets that the company will pay up some time during the week, and probably resume work. The Bay City Tunnel has completed the engine-room and are now ready to place the machinery under cover, and commence operation as soon as all the necessary machinery has arrived on the ground. The shipments during the last week were not as large as the previous week; one cause is the shutting down of the Flagstaff, and the other, that the snow has drifted in some of the roads leading to the mines that are shipping ore, which compelled their superintendents to apply the whole of last week to clear the roads, and get them in such a condition that the ore can be hauled away on sleds or raw hides. The amount of ore shipped is as follows: Emma, 70 tons; Flagstaff, 100 tons; Grizzly, 130 tons.

Alpine County Mines.

From the general mining review of the *Alpine Miner* we collate the following:—Alpine District is bounded by Silver Mountain on the south, Raymond on the west, Webster on the north and Monitor district on the east. Its water power supplied by a frontage on the East Carson river of some seven miles is unsurpassed, and the heat of timber in sufficient quantities for years to come, in connection with numerous ledges of silver-bearing ore, makes this a locality of more than ordinary interest. The rich ledges of the Scandinavian Cañon have a bearing direct for the heart of this district, and many of them have been sufficiently prospected to give them a market value in the eyes of mining experts.

The St. Helena Mine,

Supposed to be the northern extension of the Buckeye No. 2, now owned and worked by the Eschequer Co. of London, has had considerable work done upon it, developing a good quality of ore in moderate supply. The deepest working does not extend below 80 or 100 feet, at which point the ledge is large and well defined, showing unmistakable evidence of being a true fissure vein. This mine is owned by John Weis & Co., of Markleeville, and is valued at a round figure, notwithstanding the present depression in mining matters. There are several other promising ledges in the vicinity of the St. Helena, all of which will find their natural outlet at Markleeville.

Mount Bullion.

This is a mountain of large extent, literally seamed with massive ledges whose outcrop in places reaches an altitude of 46 feet above the surrounding country. The Mount Bullion Tunnel Co., an English institution, started at a point on the west bank of the Carson river at Bullions, and drove in the mountain a distance of 2,000 feet to cut a belt of ledges which cross the eastern face of the mountain. They stopped about 250 feet short of the point where the main ledge might reasonably have been expected to cut the plane of the tunnel. The company did not stop for lack of funds, like most of the companies that have undertaken the development of our mines, but stopped on the recommendation of a Superintendent who assumed a knowledge of mineralogy in advance of the expert sent out by the owners previous to the purchase of the property. When a company will accept the dictum of a person of the merest superficial knowledge of geology and mineralogy, in preference to that of such an adept as the very celebrated John Arthur Phillips of London, they are deserving of the loss entailed upon them by the abandonment of so magnificent an enterprise as this.

The Santa Eulalia Company once had a vast property in this district, consisting of a large number of ledges and about 2,000 acres of the finest timber land in the State. After expending several thousand dollars in '63 and '64, when the first reaction came after the great excitement of '60-'63, they allowed everything to go by the board. This company had a large element from Virginia, Nev.; among them we call to mind Samuel A. Chapin and Judge Leconey, and the lamented E. A. Hille, one of the pioneers of "Washoe." Mr. Chapin is probably one of the most extensive Comstock owners of the present day, having patents for several thousand feet on that famous lode, scattered along its line from Gold Hill to the lower end of Silver City. One of his locations is destined at no distant day to make its fortunate owner one of the richest men on the Pacific coast. This is the Table Mountain mine, near the Bacon mill. Prof. Raymond pronounces it unmistakably on the Comstock ledge. This leads us to the question, have we a Comstock ledge in Alpine county?

How often has this question been asked, and how variously answered, none but the pioneers of Alpine can tell. We have been favored with transient visits dating from '62 to the present writing, from such celebrities as the late Dr. Snell, of Sonora, Cal., Prof. Whitney, of the State Geological Survey, Captain James Barrett, of Cornwall, England, John Arthur Phillips, Prof. Coggia, of the Paris School of Mines, all of whom have a world wide reputation; besides such lesser lights as Prof. Kustel, Prof. W. T. Rickard, F. C. S.; Dr. Veitch, M. E., of Virginia, Nev., Prof. Lapham, of Milwaukee, Janin, brother of Louis Janin of diamond notoriety, and others less known in the mineralogical walks of life. The verdicts of such men as Phillips, Barrett and Snell, were decidedly favorable, while that of Whitney was so-so, and a majority of the balance decidedly that Alpine county must in time take high rank in the production of the precious metals. To refer back to the query as to whether we have a Comstock ledge in Alpine county, and in answer to that query, we are permitted to copy from a late report on the

Good Hope Mine.

This mine is situated on the bank of the East Carson river, about two miles from Markleeville. The report says: "The evidences are unmistakable that this is a true fissure vein. It has heavy clay walls and carries a large volume of water, and can be traced by its outcrops for a long distance, and the country upon each side for a great breadth shows evidence of extensive mineralogical metamorphism, as does the surrounding country to the Comstock. It is a fair presumption that like causes produce like results. The ore, too, is a free milling ore, identical in its combinations with the Comstock, and so like in appearance that no person but an expert can distinguish between

them." This mine was located in 1863, and was worked spasmodically up to the early part of 1867, when the company became bankrupt and it fell into the hands of creditors. A first effort was made to develop this mine by an incline shaft following the foot-wall, but at a depth of thirty-two feet the water became too strong for hand control, and work suspended. The next effort was by a tunnel running into the hill to strike the ledge at an obtuse angle, and thence by following the ledge south into the mountain. The tunnel from its mouth, in for a distance of 200 feet, penetrated a country rock of soft porphyry, when it cut a clay wall six feet thick, which drained off the water from the incline shaft above referred to, showing this clay to be the true east wall of ledge. After passing this wall for about 20 feet the vein matter consisted of a mixed porphyry and quartz showing some veins of quartz of a thickness of eight inches, which were quite rich in gold and silver. On the west wall a solid vein of quartz, three feet thick, was struck, which was thence followed in an unbroken chain southward into the mountain 400 feet. At points in this distance the ledge made to a width of 10 feet, while the average would be about five. The ore in some places is much decomposed, while in others it required a free use of powder to extract. The dip of the ledge is about 40° to the west, with a strike averaging nearly due north and south. The ore at the depth attained by this tunnel is of a low grade, averaging by mill tests \$12.75 per ton. At the time of the suspension this grade ore could not be worked to a profit. But with the facilities this mine offers for cheap extraction and the improved methods of reduction, it can now be made to yield a profit of at least \$2.60 per ton. Taking the quantity of ore in sight, with the almost certain increase in quantity and quality, as greater depth is attained, this mine offers great inducements to capitalists, and must at no distant day find an owner of sufficient means to make it a first-class property. Mines in and about Virginia and Gold Hill, with not one-tenth part the promise of this, have had from a hundred thousand to half a million of money spent on their development, without grudging, and are still being worked with vigor when the degree of promise at a thousand or fifteen hundred feet is nothing as compared with the Good Hope.

The Pantalone Survey.

The *Sonoma Democrat* gives the following concerning the contested survey of the Caslayomi grant, in which case Commissioner Drummond recently ordered a new survey: "Mr. Drummond's instructions are that the two legs of the so-called Pantalone survey shall be cut off, leaving the Geyser Springs and the quicksilver mine in the Hog's Back range on public land. This will give satisfaction to the miners and settlers on that portion of the land which will be left out of the new survey. It leaves the title to the Geysers, the Little Geysers, and all the mines with the locators and discoverers, or those who have purchased from them. The title to the Geyser Springs now lies with J. S. Polack or W. S. Chapman. The former claims under a location of school land warrants. Chapman, who is in possession, claims under a location of Sioux scrip. The contest for this great California wonder narrows down to these two parties, between whom a suit is pending. The claimants under the grant are, of course, defeated by the decision of Commissioner Drummond. The grant was made by Micheltoreno to Montenegro, an officer in the Mexican service. It called for eight leagues of land. Montenegro sold to Forbes, British Consul, his right for \$4,000. One-half the purchase money was paid down and one-half to be made on confirmation of the title by the United States.

The claim was rejected by the land Commissioners. Their decision was set aside by the United States District Court. Meanwhile Forbes died without, as Montenegro claims, having paid the balance of the purchase money. He then deeded the land to Fremont for the sum of \$80,000. Brooks and Valentine, land agents, succeeded to Fremont's title. T. J. Bell, of the house of Burron & Co., represents the Forbes heirs. At the instance of Brooks and Valentine the famous Pantalone survey was made by J. T. Stratton, deputy from the office of U. S. Surveyor-General Hardenbergh. The body of the plat lies in the direction of Cloverdale. One leg ran down Russian river, including all the land between Little Sulphur and the Muscaloon, Tzabaco and Sotoyome ranchos. The other leg ran up Big Sulphur Creek, and included the Geyser Springs and a number of mines. The survey was rejected by the Land Office in Washington, and forwarded back to take testimony regarding the boundaries. This was done in April last. The recent decision locating the land north of Little Sulphur, in a compact body, is the result of that examination. The claimants of the Caslayomi (now shorn of its monstrous proportion, its wonderful natural curiosity and its wealth of quicksilver) will have leisure undisturbed to fight over the fine sheep range which is left them south of Little Sulphur Creek."

FISH HATCHING IN CHINA.—A curious mode of fish hatching is said to be followed in China. Having collected the necessary spawn from the water's edge, the fishermen place a certain quantity in an empty hen's egg, which is sealed up with wax and put under a sitting hen. After some days they break the egg and empty the fry into water well warmed by the sun, and there nurse them until they are sufficiently strong to be turned into a lake or river.

Carbolic Acid.

The men that saw flesh and saw bones for a living are enjoying a sensation. A new invention has been given them which, though less startling than the discovery of ether or chloroform is not a whit less important. Ether abolishes the pain of operations, but the new agent in many respects abolishes the operations themselves, and restores to solid usefulness limbs which, three years ago, presented only the alternatives of amputation or death.

The name of this new king is carbolic acid, and the surgical world is all astir on the subject of his majesty's exploits.

Carbolic acid has a low origin and a smutty pedigree, for it was born in the coal mines. When coal tar is subjected to certain chemical manipulations it yields a mass of beautiful white and silky crystals, having an odor like creosote, and such a strong pungency as to be almost caustic. Diluted in water, however, it is very mild, and is borne even on raw flesh without pain.

About three years ago Prof. Lister, of Glasgow, Scotland, stumbled upon the discovery that under certain management carbolic acid would heal up most fearful injuries without the formation of any of the offensive matter heretofore considered inevitable, and with scarcely any of the usual pain and exhaustion—in fact it would close up with healthy flesh ghastly openings, which a fortnight had been wont to terminate in amputation or death. Such startling results could not remain unnoticed. The whole surgical world was aroused, and experiment followed experiment, until a wide field of fresh facts was explored, and a new surgical principle of magnificent proportions stepped into the arena.

Let us review a few of the main points of the discovery. Suppose a patient has received an injury, shattering the bones of the knee-joint and opening its cavity to the external air. What has usually been the consequence? First of all, it begins to grow red, hot and swollen; in other words, it is inflamed. Next it begins to discharge immense quantities of yellow matter, then the air which gains access causes these fluids to decompose and become horribly offensive. The decomposition generates poison in the depths of the wound of a most deadly character, which infects the surrounding flesh with erysipelas and mortification; meantime the broken bones die and rot, the patient becomes rapidly emaciated, and his haggard countenance betrays his fearful exhaustion; his veins absorb the poison from the wound and carry it to the whole system, often causing him to sink into an untimely grave; or he may barely survive, and recover, after years of suffering, with a crippled limb.

Now such cases are treated on a new plan, and the difference in the result is marvelous. The skin remains white and natural; there is no offensive odor, and scarcely any discharge or swelling; the bones do not decay; the flesh does not mortify; the blood is not poisoned. In short, the patient recovers as easily as though he had not been in the slightest danger.

What makes the difference? The microscope has revealed the mystery. It has been discovered that everywhere around us there are countless germs of living animals invisible to the naked eye. They float by millions in the very air we breathe, and penetrate to every open wound, where, alighting like an invisible dust on the moist surfaces, they develop and multiply by myriads every hour. These microscopic animals are the cause of putrefaction in all dead animal matter, and of many poisonous and putrid discharges from wounds in living flesh. So true is this that in the hottest summer weather, if a joint of butcher's meat be subjected to some process sufficient to kill all the germs upon it, and measures be taken to prevent the access of any more, it will dry up without offensiveness or decay. The same thing occurs in the pure air of the Rocky Mountain regions. In these lofty heights there is often such a destitution of organic germs in the air that dead carcasses absolutely dry up on the ground without decay. It is these pestilential animals which cause the chief part of danger and trouble in wounded knee joints and in many other surgical troubles. Hence, where filth and foul material is most abundant the germs are most numerous, and human wounds most dangerous, as, for instance, in overcrowded hospitals and in ill-ventilated houses.

Prof. Lister found that diluted carbolic acid, though innocent when applied to human flesh, was a deadly poison to all microscopic animals; and with this fact like a sword in his hand he conceived the idea of destroying all the microscopic animals in a wound by this means, and of preventing the entrance of any more, and thus evading the chief terrors and dangers.

Without going into tedious details, we may state the outline of his plan as follows: The surgeon prepares two bottles, one of which contains water holding five per cent. of carbolic acid in solution, and the other has oil holding ten per cent. of the acid. The wound is first cleared of all dirt, sticks and other dead objects which may be present, as well as all bits of bones which may be lying loose in it. It is then boldly and thoroughly washed out with the watery solution, which kills every animalcule germ within it without any serious pain to the patient. The parts are then closed up and a piece of lint or cotton batting is dipped in the oily solution and laid over the whole wound. Over this is placed tin foil or rubber

cloth, to keep out the air and retain the vapor of the carbolic acid. This process in wide wounds must be renewed every day, but in those with small orifices may be used only once a week. Of course it is varied in many ways, according to the nature of the injury and the fancy of the surgeon; but two points must be observed, viz., to kill every animalcule in this wound, and to prevent any new ones from entering. The results are astonishing.—*Mining Journal*.

More Salted Mines.

The *Detroit Free Press* says: It is pretty generally known that E. B. Ward of this city, made a big thing by investing in the Silver Islet mine in Lake Superior, which has panned out more silver dollars for the stockholders than any similar enterprise entered into since the palmy days of California mining. His success with Silver Islet made him approachable as to other mining stocks, and it has just been ascertained that he claims to have been taken in and done for fully as badly as these who invested their greenbacks in the famous Arizona diamond humbug.

History, as stated in his complaints before the police justice of Detroit, sets forth that in 1872 he was approached by John M. Whitney of Salt Lake, and Joel Lawrence of Chicago, on the subject of purchasing stock in the Eureka silver mine, located in Utah. Ward looked enviously at the rich specimens placed before him, and finally declared that if he was sure the mine was all right he might take stock. Whitney and Lawrence wanted him to be sure that it was all right—in fact, they were adverse to his taking a dollar of stock until he had perfectly satisfied himself on that point. They did not press him stronger, but held the bait ready for him and were content to wait. Ward sent an "expert" to Utah with instructions to examine the mine, and satisfy himself that it was as represented.

During the agent's absence the two men disposed of considerable stock to residents of Detroit. Several small capitalists had silver mine on the brain, and hearing that Ward was going in heavily they went for the stock like rats for a grain of gold. It is said that about \$50,000 cash was paid over to Whitney and Lawrence by Detroiters besides what was obtained from Ward. When Ward's agent came back he told such a tale of richness that the Captain could hardly take it all in at once. The mine just glistened with silver, and all that was needed was capital to mine it and send it away to be coined. The agent brought back a number of specimens to back up his assertions, and when these were emptied out Ward could doubt no longer. Whitney and Lawrence called around after a day or two, and there was no delay in closing the bargain for stock. The complaint avers that Ward agreed to and did take \$200,000 worth of stock, giving in return the following property:

Three promissory notes, each of the value of \$10,000, payable in one year from October 7, 1872, with interest at eight per cent.

The deed of a tract of land in Oakland county, described as the southwest quarter of section 33' north, of range 11' east, containing 160 79-100 acres and valued at \$16,000.

Twelve hundred shares of Silver Islet (Lake Superior) mining stock, valued at \$60,000.

Thirteen hundred shares of the stock of Wyandotte Rolling Mill Company, worth \$65,000. Lots 101, 102 and 103, section 8 of the governor and judges' plan of the city of Detroit (the old Mansion House Property on the corner of Griswold and Atwater streets), valued at \$95,000.

Whitney and Lawrence had obtained what they came for, and soon after the bargain was consummated they left for parts unknown. It was not long before Ward smelt a rat. The silver ore remained in the ground and the mine was not being worked as far as he could ascertain. He waited awhile, and when his letters of inquiry was sent back, and he could not learn the whereabouts of the men who had "stocked" him, he sent another "expert" to Utah to see what the matter was and to make a new inspection. About this time Lawrence came back here and made a glowing report of what the mine was doing, stating that thirty tons of ore were awaiting shipment and more ore was being got out every day. Ward did not give any intimation that he had dispatched a second agent, and his man arrived at the mine, made an inspection for himself, and soon found that the whole thing was not worth the powder to blow it up. The first agent had been badly duped by men who knew how much depended on his making a favorable report, but they were not prepared for the second visit, and the real state of affairs came to light.

When the agent returned Lawrence was not to be found, and on the 7th inst. Ward filed his complaints here and obtained warrants for the arrest of both. It was ascertained that Lawrence was in New York and Whitney in Salt Lake City. Detective Stadler was sent East and Sergeant Britton, West, and, as the telegraph has already stated, both have secured their men. The prisoners will be arraigned here, and when the whole case is laid bare it is expected that something rich in everything beside silver will be unearthed. Lawrence and Whitney are said to be worth \$40,000 apiece, and they will no doubt make the liveliest kind of a fight. The other Detroit stockholders are, it is stated, also prepared to make complaints against them.

USEFUL INFORMATION.

Preservation of Wood from Decay.

Mr. Herman Hanpt, O. E., has made the subject of the preservation of wood a special study, with results which cannot fail to be of great practical benefit to all wood-consuming interests. The immense quantities of timber employed in the construction and equipment of railroads, and for various other purposes where it is exposed to conditions peculiarly favorable to decay, has long made some cheap and effective process for preserving it a much needed preliminary to its use. To meet this want numerous processes have been devised, all of which are more or less defective either in efficiency or economy, or both. These attempts have taken various shapes, but in most of them the aim has been to introduce some sort of preservative material into all parts of the woody mass. The first requisite of any successful process in the material, which must not only possess the necessary antiseptic properties, but also be capable of taking a fluid or vaporous form, in order that it may readily enter the pores of the wood; and while solution of corrosive sublimate, sulphate of copper, or chloride of zinc seem to answer the purpose very well, Mr. Hanpt considers that dead oil, a product of the distillation of coal tar, is, all things considered, best adapted to meet the requirements of the case.

The next and most difficult point to be attained is the introduction of the preservative liquid into the interior of the wood; but an absolute essential preliminary to this is the removal of the air and the moisture which the wood already contains, as neither fluids nor vapors can enter its interstices in anything like the required quantity when they are already occupied. In practice it is found necessary to extract the air and water, and replace them with the antiseptic materials by a single operation, as dividing the two involves exposure of the timber to the air, which would again rush in and fill the place of that before withdrawn. In the Bethel process dead oil is used, and the operation is conducted in a single tank made of boiler iron. At the bottom and sides of this tank are numerous pipes for heating by steam. "The timber is placed on an iron car and run into the tank. The tank is filled with dead oil, which is then heated by the steam coils. A pressure of one hundred pounds per square inch is applied by means of a hand-pump. A thermometer is used to note the temperature. The duration of the process is twelve hours. Timber twelve inches square is fully impregnated, as is proved by boring holes. An air-pump is also used in connection with the operation, no doubt to remove the escaping air and steam, and relieve the pressure while the wood is being heated in the oil."

This is the most effective process for preserving timber from decay that is now known; but it is liable to strong objections, which have thus far prevented its coming into general use in this country. The wood takes up about its own weight of oil, or somewhere between three and four gallons per cubic foot, which is believed by Mr. Hanpt to be about one hundred times as much as is needed to prevent decay, and which, of course, involves enormous cost as well as enormous waste. Then wood thus saturated is exceedingly inflammable, a condition which makes it highly unfit for railroad or ship-building purposes. Regarding the theory of the process as correct, the dead oil as far superior to anything else as a preservative, the author proposes to get rid of these objections by introducing a smaller quantity of oil. To accomplish this he suggests the use of an apparatus consisting of two tanks, instead of one; "one a receiver corresponding to a retort, in which the material can be placed and subjected to the action of heat, the other a condenser, in which all escaping vapors can be condensed and a vacuum maintained during the process in both vessels." Suitable means for establishing and maintaining a vacuum being provided, the next step is the application of heat in the receiver by means of steam pipes.

The water in the pores of the wood is thus vaporized, and together with the air that is present, escapes, the water being got rid of by means of the condenser; and should the vacuum become vitiated by the escape of air from the cells, it may be improved by the use of an air-pump. "When sufficient time has been allowed for the wood to dry thoroughly, cocks must be opened connecting the bottom of the receiver with a tank of dead oil at a lower level. As a vacuum exists in the receiver, the atmospheric pressure will force up the oil, and the timber will be immersed in the fluid. When the immersion has continued a sufficient length of time, which also must be determined by careful experiment, cocks may be opened at the top of the receiver to admit air. The oil not absorbed will immediately flow back to the tank from which it was taken; the air, pressing upon the exterior of the cells which are partially filled with oil, while a vacuum exists in the interior, will force the oil before it, and thus coat in its progress the interior of the cells. It is probable that in this way a sufficient amount of dead oil may be introduced into the cells to prevent fermentation and decomposition while still far below the point of saturation, and the process may prove rapid and economical."—*Paint and Oil Trade.*

WATERPROOF PASTEBOARD.—One of the cheapest and most effectual coverings to render wood perfectly water-proof, and increase its durability, and which will impart to pasteboard the appearance and strength of wood, is that employed in many ways by the Chinese, according to tests made with a sample sent from Pekin by Dr. Scherzer. It may be prepared as a slightly viscous fluid, fit for immediate use, by stirring into three parts of fresh serum of blood (or defibrinated blood) four parts of dry slacked lime and some alum. It should be laid on twice, or at most three times, in order to render articles perfectly water-proof.

The following is given as a soap soluble in sea water: Oil or fat, 40 parts; resin, 10; fish glue, 40; soda or potassa, 1; oxalate of potassa, 1. The oil and resin are saponified as usual, but with an excess of alkali; the glue previously rendered gelatinous by solution in oxalate of potassa, is then added, and the whole heated with constant stirring to 50 degrees or sixty degrees C.

BLACK BRONZE FOR BRASS.—Dip the article bright in aquafortis; rinse the acid off with clean water, and place in following mixture till it turns black: Hydrochloric acid, 12 lbs.; sulphate of iron, 1 lb.; pure white arsenic, 1 lb. Take out, rinse in clean water, dry in sawdust, polish with black lead, and then lacquer with green lacquer.

SOLDER.—A correspondent of the *English Mechanic* writes: "Solder of excellent quality is to be obtained from the joints of old sardine tins or meat tins. I believe it is almost pure tin. I have not analyzed any of it, but from the way it preserves its luster, it must be very much richer in tin than ordinary solder."

DETECTION OF WATER IN ETHERIAL OILS.—Oils distilled with water from plants contain water, although they may appear perfectly clear. On mixing such oils with an excess of so-called benzene, a cloudy effect is produced by the precipitated drops of water.—*American Chemist.*

TO ASSIST THE SIGHT.—Persons of defective sight, when threading a needle, should hold it over something white, by which the sight will be assisted.

GOOD HEALTH.

Health and Comfort in House Building

Dr. John Hayward, Vice-President of the Liverpool Architectural and Archaeological Society, lately read a paper on Health and Comfort in House Building, before the Royal Institute of British Architects, which merits attention. It will be noticed that Dr. Hayward refers throughout to the climate of England. Though we do not have the same degree of cold here in California, we make up for it in dampness, and hence the conditions are similar.

Dr. Hayward lays down eighteen conditions in house building as absolutely necessary in a sanitary and medical point of view, some of the more important of which are due exposure to fresh air and sunlight, positive freedom from damp, a large cubic space for air, and abundant means for the escape of the foul and the admission of fresh air. He also shows that it is essential that the air should be warmed previous to admission. Indeed, he maintains that ventilation is the great and main necessity of house building; that whatever be left undone that should be especially attended to; and as in this country, owing to the nature of the climate, doors and windows can rarely be left open in the day and never by night with safety to health, it is necessary to provide specially for ventilation. And first as to the temperature of the admitted air. No contrivance that communicates directly with out-of-doors air, he considers, can possibly answer in a country like ours. This is especially the case as respects bedrooms, which are often very improperly constructed and arranged, so that the sick occupant has to be in winter in a current of air passing between the doorway and the fireplace, from 28° to 35° in temperature, while the temperature of his body is 98° or 99°. To this, in ninety-nine cases out of a hundred, patients in this country are exposed, and the evils intensified when the bed has to stand between the fire and window, and the beating draught is with the out-door air.

To these unpropitious bedrooms Dr. Hayward holds may be traced very many cases of consumption, bronchitis and asthma. In fever cases much fresh air is required, and sometimes endeavor is made to obtain it even by opening the doors and windows, so that many typhus fever patients die of pneumonia, and many rheumatic fever cases are prolonged and complicated; and with all their knowledge and care medical men cannot prevent these evils, because of the defective construction of bed-

rooms and ever of hospital wards. And it is not only patients in acute diseases who suffer from these imperfect architectural arrangements. Most persons occasionally take cold, and in the majority of instances the cold falls on the respiratory organs, as influenza, sore throat, or bronchitis, when the temperature of the air breathed affects very materially the progress of the case, whether it shall be mild or severe, whether it shall be curable or fatal. In acute bronchitis the temperature of the air breathed should never be lower than 65°; but how is it possible to obtain this temperature in ordinary bedrooms in winter, when bronchitis is most prevalent? And even when it is obtained by well-fitting windows and doors and large fires, matters are not much better, for the very means taken to obtain warmth exclude fresh air, and subject the patient and his attendants to the evils of foul air. And draughts are equally pernicious in sitting rooms, where persons may be roasted on one side and frozen on the other, resulting in neuralgia, rheumatism, colds, coughs, asthma, consumption, and a long train of cognate human ills, and the chilly lobby contributes materially to these evil results.

The dangers of the water-closet system are forcibly expounded, the author showing that in many cases the supply of fresh air to a house is obtained principally through the water-closet. "This is one of the evils that our improved architecture and building have increased, if not absolutely provided for us. The water-closet opens into the lobby; the front door is made to fit as tightly as possible to prevent cold draughts, and this prevents fresh air coming in from the front; whilst, with well-fitting intermediate doors to shut off kitchen smells, the admission of fresh air from the back of the house is prevented. These arrangements make the lobby into a chamber, with the termination of the main drain opening into it through the water-closet." In winter time the fires in the living rooms suck in the poisonous gases and disease germs through the closet-pen out of the drains.

After a passing reference to a partial remedy for such an untoward state of matters, Dr. Hayward proceeds to unfold his general and complete remedy for the evils enumerated, which is concisely defined as "Ventilation with warm air by self-acting suction power." His first requirement, which he holds to be an absolutely fundamental condition of a healthy and comfortable house, is an ample supply of fresh and agreeably warm air in the lobbies, corridors, or other central spaces out of which the rooms of the house open or draw their supply; this is provided for by a tubular pipe at the entrance opening, or somewhere in the lobby. The next thing is the admission of this air into the rooms, for which special outlets are provided, controlled by valves to accommodate the supply to the partial occupation of the room. The abstraction of the vitiated air is managed by a separate flue from the ceiling of every room and water-closet, and from every gaselier in the house, terminating in a common chamber permanently heated, and communicating with a shaft, which may be let into the kitchen flue, and must be so proportioned to the size of the house as to empty it of air three times every hour, and as often will the whole house be replenished with fresh air. This plan has been tried, proved completely successful, and very cheap. A few details snappered, Dr. Hayward concludes: "Finally, I am sure it is the warmest house in winter and the coolest in summer; the most airy and fresh, and at the same time the house that is freest from cold draughts in this country, if not in the world; and from personal experience of the comfort and advantage of living in a house built to live in, and of the discomfort of living in houses built for gain, I do not hesitate, in reference to ordinary houses, to vary the well-known epigram, and say that 'Knaves build houses, and fools live in them.'"

Floriculture and Hygiene.

A writer in the *Rural Carolinian* gives the following facts in confirmation of the sanitary value of flowers: "In August, 1866, I bought a small house in the upper part of Charleston, in a locality where fevers were of frequent occurrence; I at once set to work, drained as much as possible the lands around the house, and laid out the grounds for a flower garden. My friends warned me, and predicted that before the end of the year I would leave the locality on account of the prevailing fever. I did not mind them, but kept steadily improving my property. During the winter I had planted a great many rose bushes, oleanders, shrubs, etc., as also a few fig and peach trees. In the spring I planted a great many summer flowers, as well as lavender, mint, etc., and wherever a small space was left I planted sunflowers. The consequence was, that although several of my neighbors were down with fever, I escaped with my family entirely, and have not had a fever to this day. Several of my neighbors have followed my plan, and the locality is now almost entirely healthy."

It is not improbable in this instance that the draining of the ground should be credited with a part of the good results; but there is no doubt that the odorous emanations of plants and flowers, or the ozone generated thereby, will do much to neutralize or destroy the miasmata of malarious districts. The cultivation of flowers in such localities, will therefore be found a valuable auxiliary to other hygienic measures.

DOMESTIC ECONOMY.

Improved Buckwheat Pancake.

Buckwheat pancake is an article largely used; but as generally prepared, it is not fit to serve up at any table. It is heavy and distressing to the stomach. Though the batter may be light, yet when it gets on the griddle it is apt to fall and become the heavy and indigestible thing we find it. Not infrequently it is sour.

Now, all this may be obviated, and a light, palatable cake made, with a little care, by the addition of Graham flour mixed with the buckwheat, the proportion of Graham being a little over a quarter. Mix the flour to keep on hand ready for baking. When wanted to be used, bring to a batter with buttermilk. Other sour milk will not do; it must be milk from the churn, and it wants to be quite sour. Raise with soda, and bake at once. The first baking will in general not be satisfactory; it will lack lightness. Still it will be better than the usual pancake. Now, leave what batter remains in a warm room. This will somewhat raise it; and the cake the next morning will be improved. Another twenty-four hours' exposure to the warmth, say of seventy or eighty degrees, and there is still further improvement. After that there will be little difficulty.

It is best to have the batter, when it reaches the stove, as cold as possible without freezing. The soda will then have little or no effect till the heat of the griddle sets it in motion, baking the paste as it rises. It wants a hot fire, so as to bake rapidly. The cake then will be brown, and as light as a sponge, and very tender, almost melting in the mouth. It causes no distress whatever, but digests readily and is healthful—medicinal somewhat, which results from the coarse Graham flour mixed with it. It is highly relished, and may be eaten two or three times a day, and the year through, though it will be less light in summer than in winter, yet palatable and agreeing well. It is our own mode, invented by us after long tedious experiment. The object was to get a light palatable cake, and at the same time combine the medicinal virtue of the bran. Care must be exercised at first. Dissolve the soda in water, mix with the paste and bake at once. We have used this cake for many years, and use no other. Try it; but be patient at first.—*Country Gentleman.*

ARTICLE OF FOOD FROM CIDER.—Among the notices of recent patents we find the following, granted to Mr. Mahan, of Vermont: In making the said composition this inventor takes five gallons, for instance, of cider, as it comes from the press, and put the same into a suitable boiler, after which he mixes it with two table-spoonsful of flour and the whites and yolks of two to four eggs, first thoroughly compounding the flour and the yolks and whites of the eggs. Next, the temperature of the mixture of cider, flour, and the fluid matters of the eggs should be raised to a boiling heat, or about such, after which ten to twenty-five pounds of sugar are to be added, and the whole agitated or stirred up until thorough dissolution of the sugar may have taken place. Next, the solution is to be raised to a boiling temperature and skimmed, the boiling and skimming being continued until a sufficient evaporation may have taken place to reduce the liquid to the requisite density. After this the liquid should be strained and put into bottles or suitable vessels for preservation, use or sale. If desirable, the product thus obtained may be flavored with any proper essence, essential oil, or matter, the whole when completed, answering for various purposes in cookery, as well as being eaten on bread, or of being used as a sauce for puddings.

PEPPERS.—Seed the peppers from the top; make a brine strong enough to bear an egg, pour it boiling hot on the peppers, and let them stand until they are yellow. Take them out and put them in cold water for 24 hours. Then boil your vinegar, adding to each gallon one ounce of alum; throw your peppers into the boiling vinegar, and take it immediately off, and let them stand ten or fifteen minutes, and put into jars; when cold tie them up. No spices necessary.

CHEESE TOAST.—Take a slice of good, rich, old cheese, cut it up into small pieces, put it in a tin or iron stew-pan, and to one cup of milk add three eggs; beat eggs and milk together and pour on the cheese; set it on the stove, and when it begins to simmer, stir briskly until it forms a thick curdle, then pour over the toast and carry to table.

TO REMOVE GREASE STAINS FROM WOOD.—Spread some starch powder over the grease spots, and then go over it with a hot flat-iron till you draw the grease; then scrape with glass or a proper scraper, and repeat the starch powder and hot iron. Ammonia liquid may be used as a finish, if the starch does not take all the grease out.

GOOD CORN MEAL PUDDING.—Stir the meal into scalding skim milk, till it is thick as gruel, and, when cool, add ginger, cinnamon, nutmeg, salt, and sweetening to suit the taste, and a little fine cut suet, and some raisins or dried peaches, and a fine cut apple. It should bake an hour or more according to size.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Snow-Shoeing in the Sierras, 1. Ourselves, The Pacific Mail Company; Antimony Reduction, 8. Joseph Arch, the Labor Reformer, 9. Alaska Mines; Borax, 12. ILLUSTRATIONS.—Snow-Shoeing in the Mountains of California, 1. Antimony Furnace, 8. Joseph Arch, 9.

SCIENTIFIC PROGRESS.—Iron in Plants and Animals; Silicon Steel; The Behavior of Metals under Stress; New Method of Engraving; Smoke Consuming; A New Explosive, 3.

MECHANICAL PROGRESS.—Small Motor Machines in Europe; Sand Blast Engraving; Circular Lithographic Stones; Wheat Cleaning Machinery, 3.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 4.

MINING SUMMARY from various counties in California, Nevada, Colorado and Lower California, 4-5.

USEFUL INFORMATION.—Preservation of Wood from Decay; Waterproof Pasteboard; Black Bronze for Brass; Solder; Detection of Water in Ethereal Oils; To Assist the Sight, 7.

GOOD HEALTH.—Health and Comfort in House Building, Floriculture and Hygiene, 7.

DOMESTIC ECONOMY.—Improved Buckwheat Pancake; Article of Food from Cider; Peppers; Cheese Toast; To Remove Grease Stains from Wood; Good Corn Meal Pudding, 7.

MISCELLANEOUS.—The Emma and Eureka Mines; Salad Oil an Antidote to Strychnia; The Signal Service Report; A Lost Population; Advertising Mineral Locations; Base Metal Interests of White Pine; Eureka Mines; Carbolic Acid; Southern Mining Interests; El Dorado Mines; Wooden Pavements, 2. Alpine County Mines; The Pantalone Survey; Fish Hatching in China; Carbolic Acid; More Saltd Mines; Peavine District, Nevada; Calaveras Gravel Mines; Cost of the Hoosier Tunnel; Fatal Mining Accident, 10. The Jaya Mines; New Factory; Panamint Mines; Depth of Lake Tahoe, 11.

Ourselves.

The MINING AND SCIENTIFIC PRESS enters upon its 28th volume at an important period in the history of our Coast. The mining interests have never been more prosperous than during 1873; nor have we ever had a brighter outlook than is before us for the New Year. The dividends from mining incorporations on the lists of the Boards for 1873, have amounted to the sum of \$13,356,000, as compared with \$6,731,100 in 1872. The large profits from numberless other mines not known to Stock Brokers, swell these figures immensely, and 1874 is expected to eclipse its predecessor.

The number of persons engaged in mining is increasing, and our subscription list increases also, as we represent that class of people. We shall still continue to gather information from all reliable sources, such as will be interesting to our readers, and endeavor to make our paper as practically useful to the mining community as possible. All the new and improved processes for the reduction and amalgamation of ores receive special attention. We maintain the most comprehensive review of the mines of the Coast in our weekly mining summary that it is possible to procure, which in itself is worth more than the price of the paper. Our increasing list of practical correspondents who write on mining matters, is a source of gratification to us and of benefit to our readers.

The coming 12 months promise greater development in the mineral progress of the Coast than has been experienced in any past year, and no one can afford to do without a journal which represents so great and growing an industry. The beginning of the year is a good time to subscribe, and the \$4 paid for a year's subscription of the MINING AND SCIENTIFIC PRESS may save to the subscriber many dollars in other directions from the hints he receives from its columns. We shall do our utmost to make the Press acceptable and valuable to its readers by collating all the varied information possible on subjects connected with the mining industry and scientific progress.

Antimony Reduction.

Although antimony ores have been found in several places in Nevada and the reduction of this metal has been tried at different times in that State and in this city, it has not seemed to have been carried on successfully; at all events operations have been discontinued. The use of antimony is very extensive, its principal value being as an alloy with tin, lead, copper or bismuth for shaft boxes, type, queen's metal, etc., and also in combination with oxygen, sulphur and other substances as medicines, of which there are some ten or twelve different preparations.

The principal ore is gray antimony or sulphuret of antimony, which occurs so often in veins with silver ores in Nevada, Idaho, etc. This ore yields nearly all the antimony of commerce. The mineral sometimes contains \$150 per ton in silver. The white antimony and antimonial blende occur less frequently. The assays of sulphuret of antimony, if made by fire, are not reliable unless melted at a low heat, and prepared

in the following way: Five parts of antimony ore are mixed with ten parts of prussiate of potassa and covered with two and a half parts of cyanide of potassium. This method of assaying, if the ore is melted at a cherry red heat, gives 72 per cent. of the antimony; while all the other ways give less.

There are two processes of reducing antimony ores, either by the process of liquefaction or by direct smelting for metallic antimony. The liquefaction is of course only practicable with sulphureted ores. It is a separation of the sulphurets from the gangue by heat, and yields crude antimony, which is used for several technical purposes, but principally to make metallic antimony.

This process has in some places the advantage that no flux is required, and it is easily performed near the mine, especially where there is no water to enable them to concentrate.

The process of liquefaction always involves a loss of from 10 to 12 per cent. in antimony, but it is nevertheless practiced in many places in Europe. This process is carried on either in earthen pots, or crucibles or in liquefaction furnaces similar to roasting furnaces. In some parts of Germany and Hungary earthen pots are in use (especially for the richer ores) similar in shape to the French assay crucibles, except that the lower part is somewhat extended so as to fit in another pot below. The bottom of the crucible is perforated and the lower pot is surrounded by ashes. It requires a low heat to melt the antimony, which flows into the pot below the crucible. In other instances the pots are placed in furnaces of very different construction, but always so that a number of the pots, from 12 to 15, are placed in a circle so that one fire may heat them all.

The most practical furnace of this kind for a larger production, is that used in France, an engraving of which is shown on this page in vertical sections. The furnace has three fire places, *e, f, g*, the grates being 4 feet 5 inches long, by 10½ inches wide. The flame enters the chambers, *b*, through several openings, *o, p, q*, and also the space, *y*, and escapes through *d* with the chimney, *l*. Iron doors, *s*, are placed on both sides. Each chamber, *b*, contains two

cast iron pots, *a*, twelve inches high and nine inches wide, resting on cars. The chambers are covered with plates, provided with circular hollows for the reception of the earthen cylinders, *c, c*, with a hole in the center of the hollows, through which the sulphide of antimony flows into the pot, *a*, underneath. The cylinders are over three feet high and are provided with an opening, *n*, (Fig. 2) for the purpose of removing the residue, which openings are closed during the operation. The cylinders go through the arch, *m*, and are shut up by a cover.

The cylinders, *c*, are charged through the door, *i*, (after the furnace has been brought to a light red heat), with antimony ore the size of a hen's egg, and then covered. The sulphide of antimony soon begins to flow into the receiver, *a*, with a blue color if the heat has been properly regulated; but if the color appears red, it shows that there is too much heat, and a loss of antimony is the result. The openings, *o, p, q*, are shut up tight as soon as the pots, *a*, appear hot enough. After all the sulphuret of antimony runs out, the shutters, *n*, of the cylinders are removed and the residue drawn out.

The pots, *a*, when filled about two-thirds, are replaced by others. The operation continues for about 20 days and the cylinders are charged every three hours. Each cylinder takes about 490 pounds of ore at a charge.

LARGE INDUCTION COIL APPARATUS.

The Scientific Department of the St. Ignatius College in this city has recently had added to its apparatus, an electrical coil apparatus which was lately manufactured expressly for this College, by the inventors, E. S. Ritchie & Sons, of Boston, Mass. It contains 156 feet of thick silk-insulated copper wire in the Primary Coil, and 151,056 feet of fine-silk covered wire in the Secondary, (amounting to over 28½ miles,) round an electro-magnetic core of 12 lbs. of small soft iron bars, carefully annealed, with 350 square feet of metallic foil, insulated by oiled silk, in its condenser. It is capable of giving torrents of electricity of high tension, and throwing thick sparks, over 18 inches long, in air. The apparatus can be worked by hand, or automatically at will. It possesses arrangements to commutate the poles of the battery, to connect or disconnect various portions of the condenser, to introduce different interrupters or break-pieces, for the production of various effects, and is altogether the very best ever made by its renowned inventors, and one of the most powerful now in existence either in America or Europe.

Ore Production.—The Belcher mine is yielding 450 tons of ore per day; the Crown Point is yielding 400 tons; the Consolidated Virginia 260 tons, yielding on an average \$81 per ton; Chollar Potosi, 100 tons per day, assaying \$30 per ton; Sierra Nevada, 60 tons per day. Last week of the Utah mines, the Emma shipped 70 tons, Flagstaff 100 tons, and Grizzly 130 tons from Little Cottonwood. The enormous yield of the Comstock mines is scarcely appreciated unless compared with those in other localities, where ten tons a day is a big yield.

QUICKSILVER is very firm at \$130 in gold in New York, and sells at £20 sterling in London.

The Pacific Mail Company.

The Pacific Mail Steamship Company have lately been making extensive changes in their affairs and reducing their expenses considerably. The rates of freight and passage have been reduced between this city and New York. Dispatches to the *Call* from New York, dated Dec. 30th, state that the company has refused to renew its combination contract with the Union Pacific Railroad Company, whereby freight rates between that place and San Francisco have been enhanced. Appearances indicate, however, that the steamers are only fighting for better terms, and will renew the combination if the railroad concedes to their demand. It looks like a lively competition for a while, in which the steamers will have the advantage because they control the entire route; while the Union Pacific Company must accede to other companies this side of Omaha. The managers of the steamer company announce their intention to dispatch a vessel weekly from New York, and to take freight through to San Francisco for 1½ cents per pound. They also say the China line will be through from Hongkong to Panama, via Yokohama and San Francisco, without change; thus connecting with the Atlantic steamers via the Isthmus. Four of their new iron steamers are in commission; two more will be ready within a fortnight, and in the course of four months they expect to place two large iron ships on the China line, making eight in all, and furnishing unequalled facilities for the transaction for all business offered.

It is also said that the Pacific railroad will join with the English service about to be inaugurated, and an opposition in the trade will be the result, which must be a benefit to this city. The company say that the schedule time from New York to Yokohama will be 60 days. The fleet of vessels of the Pacific Mail Co. will soon be a large one. The iron screw steamers now in service are as follows:

"Acapulco," 3,000 tons; length 280 feet; beam 40; depth 30½; length over all 300 feet; cost \$550,000.

"Granada," 3,000 tons; length of keel 280; over all 300; beam 40; depth 30½; cost \$550,000.

"Colima," 3,500 tons; length of keel 292; over all 312; beam 40; depth 30½; cost \$600,000. This steamer sailed October 2d for San Francisco.

"Colon," 3,000 tons; length of keel 280; over all 300; beam 40; depth 30½; cost \$550,000.

The "Acapulco," "Granada" and "Colon" can accommodate 190 cabin and 300 steerage passengers. The "Colima"—210 cabin and 400 steerage.

The iron screw steamers now being built are as follows:

"City of Peking," 6,000 tons; length 421 feet; beam 47½; depth 36. Cost, \$1,127,000. By terms of contract, the "City of Peking" was to have been completed and delivered November 1st, 1873. Contract is not yet fulfilled.

"City of Yeddo," 6,000 tons. Dimensions and cost same as above. The contractors expect to be able to deliver one of the above ships in February, and one in April next.

"City of Panama," 1,700 tons; length of keel 242 feet; beam 36, depth 20. Contract price, \$300,000.

"City of Callao," 1,700 tons; dimensions and cost same as above. By terms of contract ships should have been completed and delivered September 1st, 1873. Contract not yet fulfilled.

WHITE PINE BULLION PRODUCT.—The bullion shipped from White Pine during the first three quarters of this year, was as follows, according to the *News*: Quarter ending March 31st, 1851 tons of ore produced, \$33,425; quarter ending June 30th, 4,904 tons produced, \$178,832; quarter ending Sept. 30th, 5,384 tons produced, \$165,737. During the past three months the Eberhardt mill has been producing large quantities of bullion, so that an increase of yield may be expected.

NEW AGENT.—Chas. M. Daly will visit Stockton and vicinity in the interest of the Press. Formerly a resident of that city, he has since had experience in newspaper business. Our readers may expect soon to hear something from him concerning the local industries of that place.

THE Placer Herald, of the 27th of December, speaks well of the Lincoln coal mine, which is now opened. The hoisting works are completed and a large force of men are at work.

(Continued from Page 1.)

his feet being held by toe-straps of strong sole leather or india-rubber belting, fastened to either side of the shoe, and laced, where they meet over the foot. The toe of the foot is put into the straps back to the ball, and in the hollow of the foot there is a small block inserted crosswise to prevent the foot slipping back; but this does not prevent the foot, when the heel is raised, from being slipped out of the straps. The bottom of the shoe resembles a skate with a groove, but instead of being convex, it is concave. This is necessary to balance the weight of the rider as equally as possible from end to end. They are constructed on the principle of skates, and to some extent the same evolutions are practicable, such as allowing the points and curves to describe a circle. Of course they cannot be turned so easily or quickly as skates, but still they are easily managed by experts.

The *sine qua non* of snow-shoe racing is "dope." This is the material used to lubricate the bottom of the shoe and cause them to glide swiftly over the snow, as an axle is lubricated, to cause the wheel to revolve easily, the object being to counteract friction as near as practicable. To such a perfection has the manufacture of this article attained that friction has to a great extent been overcome.

The temperature of the snow is as variable as that of the atmosphere, and for every temperature of snow a different kind of dope is required. Every racer has at least half a dozen recipes for compounding the "dope," sometimes termed "greased lightning"—one for cold snow and one for warm (?) or damp snow, as it is called by experts, as when the snow is heated by the rays of the sun; one for dry snow and one for wet, one for hard and one for soft; one for forenoon and one for afternoon; for extreme cold or frozen snow; and for new dry snow there is still another kind required. Some go so far as to have a different kind for every hour of the day. For moist snow the dope is soft, and is made harder for increase of temperature, up to the frozen, when a hard dope is required. The manufacturer requires considerable skill and ingenuity. A great deal depends upon the boiling of the dope; some requires but a light simmer, enough to melt the parts together, while another requires a good deal of boiling—gum, beeswax, rosin, sperm candle, and some other materials make an inferior quality of dope, only used for traveling purposes, but modern "lightning dope" is manufactured from spermaceti, Burgundy pitch, Canada pitch, balsam of fir, spruce, cedar, Venice turpentine, oil of cedar, pine, hemlock, fir, spruce and tar, glycerine, Barbary tallow, camphor and castor oil and many costly drugs known only to those who make it a specialty, and its manufacture a secret. Oil, grease and such material one might naturally suppose would cause a shoe to slip easily over the snow;—varnish or any other polished material is useless—nothing but the scientific preparation will do. It may seem that a "snow-shoerist," who enters the arena for a hard contested race, to meet all the changes of snow must have a commissary and necessary varieties of dope, for it is a common saying amongst snow-shoers, that "Dope is King."

The dope, in order to be good, must possess two qualities: First, it must be sticky, so that it will adhere to the shoe; Second, aliphary, so that it will glide over the snow. And, strange as it may seem, they have attained such a degree of perfection in making this compound, that a snow shoe prepared with it and placed by the side of one with the bottom finished with polished steel, would so far outrun it as to make it no race at all. In riding for the first time down a steep hill on shoes so prepared, the great requisite is confidence. Timidity is fatal, and for one, on starting down a hill to be afraid of falling, will never do; he might with as much success try to stem the current of the Niagara river as to keep from falling when he thinks he may, or has not confidence in himself. In racing it is advisable to ride very low upon the shoes, in what is called the "squatting" position, and to hold the pole in the right hand, and in going over any obstruction, occasioned at times by a tree lying across the track under the snow, or by the wind drifting and forming a depression and elevation, which will, when a snow-shoer is going down very fast, make a considerable lift; both shoes and rider, and sometimes the shoes go on their course alone, while the rider is making a strange gyratory motion in the air, a thing not uncommon with beginners upon these quick and uncertain carriers.

Snow Shoe Races.

As soon as it is decided by a snow-shoe club to have races, it is announced in all the local papers, and by placarding large, flaming posters in all conspicuous places in Sierra and adjoining counties, offering large sums as purses to be run for, aggregating often many thousand dollars, besides which, large sums are often bet on the results. When the day arrives for the races, and the first day thereafter, all roads and trails to such a place from the surrounding country are lively with all sorts of people from the neighboring towns and mining camps of Plumas and Sierra counties; ladies, miners, merchants, hotel and saloon keepers, all other professional men, ministers of the gospel, gamblers, and editors as reporters of the local pa-

pers, and a numerous retinue of young devils—all excellent judges of snow shoes and dope, are on the road. On one occasion the famous Thompson, from Silver City, in Alpine County, the famous snow shoe mail carrier, from Carson City in the state of Nevada to Placerville in California, before the iron horse was snorting over the Sierra Mountains, (and who beat the railroad train he was traveling on last winter, when in the snow blockade over the mountains, by leaving the same and traveling on snow shoes at the rate of 40 miles per day,) came over 200 miles, traveling from his home on snow-shoes to Lake Tahoe, there is a skiff across the Lake, continued on snow-shoes to Truckee on the railroad, where he took the cars for Colfax, then by stage and sleigh via Nevada city, Grass Valley to Camptonville, and the remainder of the route on snow-shoes over mountains and cañons until he reached La Porte, to participate at the annual races of the Alturas snow-shoe club, and if possible to carry away the several thousand dollars offered as prizes for the fastest in each race. But when he came to run down on his old fashioned, but very practical Norwegian snow-shoes, without dope for traveling he found himself far behind the slowest.

Racing.

The racing track, clear of trees, shrubs and other obstructions covered with many feet of snow, the more the better, is chosen on steep

for a few seconds. Sometimes one or several fall on the start by striking their shoes in poling. Now they are running 40 miles an hour—now 60, and in a second or two they are going at the rate of 70 or 80; here one runs over a rough place and loses his balance—his shoes fly in the air and touch one another—away he goes and throws another, and heads, legs, arms, poles, and perhaps broken shoes are turning in 20 to 50 feet summersaults, amid a cloud of snow, raised by the current of air produced by their fall and velocity, and if the shoes are not broken, they shoot off in the air like an arrow, or like a riderless war-horse in battle, over the snow field, and leap often several feet high in the air, until they run against a tree or into a ravine, where they get stuck on the other side, if they do not go again over the next hill, in the snow bank.

The suspense is over, the crowd breathe again, the friends of the winner close around him, and cheer follows cheer, especially when ladies are racing. Nobody hant, everybody feels well. Go it, again! Another squad is formed, and all is repeated again.

These races are of an all-absorbing interest, so that often the reporters, in the excitement, forget to take notes or memoranda of any sort, forgetting that there are types and printing presses in existence—or that the "devil" was watching them, leaving his duties to some old snow-shoerist to perform, who is also for-

JOSEPH ARCH.

side hills and is about 1,000 to 2,000 feet long with an angle of depression of 15° to 35°, being always in a direct line and as even as possible. The winning poles are set on the lower end, on comparatively even ground, in order to give the racers a chance to brake up, after passing through; which is done by dragging their poles behind the shoes and bearing heavily on them in a sitting posture.

When the entries are made, which are one dollar for each day's racing, the races are divided into squads of 4, 6 or 8 men, generally representing different towns, and the winners of such squads make up other squads in like manner, until they saw off for the deciding race, of which the last winner takes the purse. There are generally each day 3 or 4 purses run for.

Say for instance the first squad is on the top of the track, and the process of "doping up" is going on. We will watch them; the dope is of about the consistency of shoemaker's wax, and is applied by rubbing on little dabs, then spreading it evenly by hard rubbing with the palm of the hand until a fine coating is evenly put on, not too thick, and a polish, that will reflect one's face, is obtained. Time being called, the racers take their places, side by side, all their boot fronts in one line, and they holding themselves back with their poles, on the bottom of which a flat round button of wood is fastened.

The instructions are then given, to wit: "The first man through the winning poles, on his shoes or on one shoe, wins. Anyone starting before the tap of the drum cannot win." The drum is then tapped out of their sight; at the same time a red flag is dropped to inform the time keepers and judges on the lower end that the racers have started, (time kept with stop watches,) and they shove off with their poles, poling for dear life and giving as many strokes as they can to accelerate their speed. When the highest attainable speed is reached, they squat low on their shoes to prevent retarding speed and to offer as little front as possible to the resistance of air, and to retain their balance in going over uneven places.

There is a breathless silence, from the start,

getful, being interested himself; and the opulent banker, fearfully bloated with bonds, county scrip, railroad and mining stock, for the space of several long hours, also forgets, perhaps the first time in years to think, in the excitement, that there is such a thing as big stone house, with safes full of twenty dollar pieces, gold dust and collaterals.

Even ladies fully attest, by their performance, that they, too, have a lively interest in the sport. Prizes are offered, for which they contend, on snow-shoes, among themselves. Most of them are quite experts on the shoes, and are very competent judges in all matters pertaining to the science.

The occasion closes generally with a free and easy dance in the evening, when the winners of the day are lionized, and the conversation turns of course on nothing but the state of the snow, dope, shoes, pretty riding, gymnastic performances, time made on other occasions, etc.

The following fast time has been made at different races, as per authentic record, kept by the different snow-shoe clubs:

At La Porte, Plumas county—"Alturas Snowshoe Club"—1,400 feet in 21 seconds, or one mile in 1 minute 19.2 seconds; 1,200 feet in 15 seconds, or one mile in 1 minute 6 seconds; 1,230 feet in 14 seconds, or a mile in 1 minute .09 second. This last distance, of 1,230 feet, was also made by a young Miss of 14 summers in 21 seconds, or a mile in 1 minute 30.14 seconds.

At Port Wine, Sierra county—"Port Wine Snowshoe Club"—1,030 feet in 12 seconds, or a mile in 1 minute 1.51 seconds; 1,025 feet in 12 seconds, or a mile in 1 minute 1.75 seconds.

At Howland Flat, Sierra county—"Table Rock Snowshoe Club"—1,400 feet in 22 seconds, or a mile in 1 minute 22.97 seconds; 1,250 feet in 21 seconds, or a mile in 1 minute 23.71 seconds; 1,265 feet in 25 seconds, or a mile in 1 minute 41.34 seconds; 1,135 feet in 20 seconds, or a mile in 1 minute 33.04 seconds; 1,380 feet in 19 seconds, or a mile in 1 minute 12.69 seconds; 1,185 feet in 20 seconds, or a mile in 1 minute 29.11 seconds.

At St. Louis, Sierra county, a 9-year old

girl went over snow drifts and holes, 300 feet distance, in 7 seconds, making her mile in 2 minutes 3.2 seconds.

Great steadiness is required in riding, and very perfect control over the shoes; but still with all the best riders some times, plough the snow and bound in the air at a fearful rate. Serious injury is seldom sustained from falling. The greatest danger lies in other riders coming in contact with one falling. I will venture the assertion that in no place but in California can so many men meet, contesting for prizes and the reputation of so many towns, and part in the utmost friendship.

Ekating is healthy, graceful and delightful snow-shoeing is equally so, and viewed in a gymnastic light it has everything to recommend it, especially in those portions where our long and tedious winters are met with, which are thereby made seasons of jollity and sport. Within a few years even our horses and mules have had to learn to travel on snow-shoes. The mail contractor on the mail route from La Porte invented some kind of a snow-shoe, by which his animals are enabled to travel over deep and soft snows, which they hardly could do before. It is made of heavy India rubber belting about three-fourths of an inch thick, flat, and in the shape of an octagon, about 6 to 9 inches in diameter and fastened with screws by means of iron bands made to fit over their hoops.

Joseph Arch, the Labor Reformer.

We present this week a sketch of Mr. Joseph Arch, the great labor reformer, who came to this country to tell us what the agricultural class in England endures, what it demands, what it has accomplished within the past two years in the effort to rid itself of tyranny, and what it means yet to do.

Mr. Arch shows that the condition of the agricultural class in England to-day is worse than twenty-five years ago.

The Agricultural Laborers' Strike in England.

"He who makes, waits," is an old Turkish proverb. We do not know that Mr. Arch ever heard of it. Perhaps not. But he acted upon the idea that it conveys. In his native village of Barford, in Warwickshire, alone he taught himself to read while working in the field; he married at the age of twenty-five, and when two children had been born to him, went struck him. He was receiving pay for his farm labor at the rate of eighteen pence a day—equivalent to thirty-six cents in American money, or \$2.16 a week. Or, to follow out the calculation, his wages gave exactly fifty-four cents per head for the support of a family of four during seven days. Out of this pitiful earning, each member of the Arch family had to be lodged, fed, warmed, lighted, and clothed—or, at least, English custom had decreed that it should be so, but what wonder that Joseph Arch struck? He struck for freedom for himself, for comforts for his wife and his children, and, above all, for the emancipation of his class. His "strike" was destined to be the spark to fire the train.

He went to seek for work, and like all men of simple purpose and willing hand, found what he sought. He became an itinerant hedge-planter; did odd jobs whenever a chance was offered to turn an honest penny; wandered for years from farm to farm, and from county to county, doing piece-work by day and often sleeping under hedge-rows or in old barns at night—carrying with him a bit of candle and his Bible and the newspaper. There must be in this man a spice of the covenant. He has drawn the sinews of his mind to their finest tension, and braced them with the Scripture. "He has gone out to do battle with the mighty, and the mighty have already bowed down before him."

Born to be a leader, it was not strange that the single-handed "strike" of Joseph Arch soon placed him in command of a vast army. Affected by an irresistible impulse he began to preach to the poor among whom he earned his bread. His faith was the simple faith of the Primitive Methodist—his learning, the wisdom of his Bible—his eloquence, the burning lava distilled in this human volcano by Nature. Crowds flocked to hear him. They hung upon his words as men who would learn their fate. His popularity grew apace.

In that month three laborers consulted together at Barford. Two of them had come from Wellesborne; the third was Mr. Arch. They devised a plan for the establishment of an

Agricultural Laborers' Union.

Similar to that which had been adopted by the Artisans' Trade Union in England. There was but a single step from the conception of this idea to its crystallization in practice. The conference of the three laborers at Mr. Arch's home was followed by a visit of Mr. Arch to Wellesborne. A day or two afterward, as though by spontaneous impulse, a thousand farm laborers assembled beneath a great chestnut-tree, which still stands in the center of Barford Village, and there listened to Arch while he unfolded his plans to the association. This was the beginning of the great strike. That spreading chestnut-tree is to the English laborer to-day as sacred as the Royal Oak was sacred in the eyes of the old cavalier, the Liberty tree to the Massachusetts colonists, or the relics of the Charter Oak to the men of Connecticut, and it goes into historic tradition like the famous apple tree at Appamattox Court House.

Pea-vine District, Nevada.

A correspondent of the *Bulletin* writes as follows from Poe City, Washoe county, Nev.

The district is about six miles in a direct line, or by the Antelope and Long Valley Wagon Road, about nine miles northwesterly from Reno. It lies along the eastern slope of the Pea-vine mountain. The district has every facility for ingress and egress of freights, etc., being connected by a good natural road with the main wagon road before mentioned, which traverses the valley along the foot of the range about two and a half miles east of town. Mr. Laka, of Poe City, runs a daily line of stages between this place and Reno, and Hammond & Wilson of Reno run a line of splendid six-horse Concord coaches daily between the two points; and the fact that their vehicles arrive here loaded down with passengers, indicates a prosperous outlook for this locality, as well as an exceedingly healthy business for the proprietors of the lines. The fare charged is only \$1.25.

The present population of Poe City will not vary much from 200. It contains a thrifty country store, which drives a large trade with the miners and residents of the surrounding district. I have met with no saloons here, have seen no case of drunkenness, no rowdiness nor flourish of the dagger or pistol, so characteristic of the new mining camp. These circumstances impressed me as a marvel in our pioneer annals. The people here simply mean business, and hope, anxiety and business vitality are everywhere manifest in a degree to mark the community.

The Geology of the District.

There is a striking resemblance between this and the Comstock district in the matter of geological age, formation, etc. Clarence King has already so well described the geology of the latter district that I can almost entirely save my labor. The range of mountains on the easterly slope of which the district lies, is a spur of the Sierras, some three or four miles nearer the parent chain than Virginia.

The Mines.

Several cañons here have for seven or eight years been more or less worked during the spring freshets for placer gold. In fact, it was the discovery of free gold in these cañons that first attracted attention to the district. Judge Webster and others have for a number of years had men engaged in some of these cañons during the prevalence of the spring freshets, sluicing the surface dirt for its free gold, and they have realized several thousand dollars for each season's work. Experienced placer miners give it as their opinion that with the use of an ordinary gold rocker, good wages can be made at washing the surface dirt in many of the cañons and gulches of the district as long as water can be obtained for the purpose. It is generally believed—and the opinion is very strongly supported by the fact of the existence of this rough looking placer gold—that one or more gold-bearing ledges of great strength and extent trend in a north-west and south-east course through the district below the base of Pea-vine mountain. According to this theory, the friable quartz forming the ledges' outcrop, having become disintegrated by atmospheric and aqueous agencies, has washed away, and the immediate track of the ledge becomes overspread by the adjacent elevations, thus leaving what the miners term "blind" ledges. Two or three tunnels, projected in unconflicting portions of the district by companies having ample capital to prosecute the work a distance of two or three thousand feet if necessary, could scarcely fail to yield enormous profits on the investment. The results of the prospecting thus far done would seem to indicate a ledge belt having a width of from five to seven miles, and including a limited series of fissures. A very large number of locations have been and are being made here, many of which are doubtless valueless, and many more but destined to be absorbed by what shall finally prove to be the true vein lodes of the district. A long catalogue of locations remain, however, whose assays and general characteristics stamp them as very valuable, and as indicating still more abundant productions upon further development. The Carr Tunneling Company are energetically developing the south extension of the great Paymaster ledge. Mr. Carr is a miner of great experience, and he feels warranted by present indications in expressing the opinion that he will cut the Evans ledge at an early day. The stock of this company is divided into 30,000 shares.

Poe Consolidated Mining and Milling Company's Works.

I visited the Poe Consolidated Mining Company's Works and found a gang of miners busily putting into place various sets of systematically dressed square timbers, and still further along to where other gangs were braasting out from the Paymaster ledge the black sulphureted silver ore of a mine which is destined ere long to rank among the famous silver mines of Nevada. Mr. Pierce, the foreman, explained to me how the Paymaster main tunnel, after cutting the heavy clay saam of the foot wall, braasts off through the ore in the neighborhood of a hundred feet both to the north and south on the course of the ledge whence the ore now being deposited at the mill for reduction is derived. A drift has been carried across the ledge about fifty feet—far enough to show that it would pay to continue it to the opposite roof wall of the ledge. The work was suspended about thirty feet short of that point, but will be resumed presently. A considerable portion of

the west wall of the vein yields low grade, but perhaps something more than expense-paying ore; but the almost boundless supply of rich ore in the twenty or thirty-foot streak near the east wall, now being mined, will probably content the company to leave the low grade ore to be got out by their possible successors, a decade or so hence. During the last thirteen years I have been brought into contact with most of the prominent miners of the State; but I cannot now recall any widely-known mine with which to institute comparison by way of a condensed description of the saneable features of the Paymaster mine, which serves that purpose with so much fidelity as the old Ophir claim as it was in the early days of the Comstock. Like that claim, the heavy body of argentiferous ore exposed in a raise for purposes of ventilation which is being carried upward from the north level or breast of the Paymaster, has a yellowish red appearance. Like that claim, again, the ore in and below the horizontal levels of the Paymaster drips with moisture, and prevents the white, flowing appearance and substantial characteristics of the Comstock. A large number of assays have been made from this mine, those made at the United States Branch Mint at Carson showing a minimum of \$30 per ton, and from that upward through almost every describable valuation to the maximum of \$1,080 per ton. Twelve men constitute the entire force of hands employed in and about the mine, including those who execute the timbering, those who mine out the ore, and those who run out the same upon cars, and deposit it in the battery room of the mill. This force is found more than sufficient to keep the Company's mill steadily supplied, although the amount being crushed will probably not fall short of, and may exceed 25 tons per day of twenty-four hours. As upon the Comstock, so here, a considerable amount of sulphur—in the form familiarly known as the sulphuret of iron—is found with the ore, and also a small percentage of argentiferous glens. The presence of these minerals, some mill-men are inclined to believe, will render impossible the amalgamation of the precious metal by the usual simple methods. Mr. Toombs, I learn, however, is prepared for any such contingency, having shaped his improvements thus far with due reference to its possibility. The evil thus anticipated by some, in fact, foreshadows upon further development, rather an advantage to all. In the event, in question, roasting and chloridizing furnaces may be conveniently attached to the Company's present reduction works, at an expense of from \$5,000 to \$7,000. Such furnaces are guaranteed by responsible parties to save 90 per cent, and upwards of the assay value of the ores. The cost of reducing the ore by this method would, owing to its simple metallurgical constituents, and the consequent high percentage of its value obtainable, be much more than compensated by the increased savings. Prospectors are incessantly grappling with the secrets of mother earth here, and this energy and activity cannot fail to make more remarkable the contrast between the present condition of mining developments in this region and their condition a month hence, than is that which the past month's work has made so plain.

The Pos Mine.

Another mine purchased by this same company, and merged into the Poe Consolidation, is the Pos mine. The Pos, like the Paymaster, contains 15,110 feet, and lies in a general parallel course with, and about three-quarters of a mile east of or below, that mine. More space than is at my disposal would be required for an adequate description of this valuable mine, and I shall leave its more important details to be discussed in a future article. It should be noted here, however, that the width of this ledge, now exceeding seven feet, abows progressively greater as the depth is increased. The ore occurs in small, finely-divided blocks, having a light red color. No refractory bases whatever are encountered in this ore. A number of thorough mill tests of it have already been made. The milling results have ranged from \$24 to \$30 per ton. Large quantities of the ore are corded upon the dumps. The present works of the mine, it is estimated, would easily yield sixty tons per twenty-four hours at an expense for mining, including timbering, etc., of not to exceed \$3 per ton. The advantage of location, water and wood, will doubtless render the erection of another suitable mill at this mine the first business of the company upon the approach of the early months of the summer. This company's mill, with its ponderous and extensive machinery for crushing the ore and separating the precious metals therefrom, has probably cost not less than \$25,000. The capacity of the mill is twenty-five to thirty tons per day. The machinery throughout comprises only the A No. 1 improved patterns. The completeness presented in all its material appointments, makes a worthy monument to the mechanical genius of the skillful millwright, W. L. Hsley, its builder. The mill is located on the northwesterly adga of the town, and stands just at the mouth of the Paymaster tunnel, the track of the latter connecting with the battery of the mill. It is expected that the present mill will treat the Paymaster ores successfully, but should there be too much waste, teams will be put on, and the mill kept supplied with ore from the Poe mine until the improvements and additions which I have before referred to, can be completed and placed in readiness for work.

Bright Prospects.

In the line of laboring men, mechanics and

artisans the demands of business are well supplied for the present. But if the winter snows should be sufficiently heavy to give an abundance of water in the streams in the early spring, a hundred or more men having a few hundred dollars each to procure proper and effective appliances, could make, I have no doubt, satisfactory wages at sluicing the surface dirt of many of the cañons and gulches for free gold. In the light of my long experience in connection with mining industries, I am strongly impressed that there is here a golden opportunity awaiting heavy capitalists and companies organized with sufficient capital to prosecute developments to success.

Calaveras Gravel Mines.

The *Calaveras Chronicle* has the following: Work in this various gravel mines in this immediate vicinity was never before so vigorously prosecuted as at present, nor were the results ever more favorable. The late rains have increased the supply of water to an abundance, and as ample preparations have been made to utilize it the presumption is fair that the yield of the mines this season will exceed that of any previous year. The fact that operations, generally, are conducted upon a much more extensive scale than formerly will also have a tendency to enlarge the aggregate result of the winter's washing, and stimulate more active development in the future.

In the Duryes hydraulic, in Chili Gulch, washing has lately been resumed and will have continued without intermission until water fails next fall. The yield of the claim during the past season was immense, and as the mine is now in better condition for working advantageously than formerly, increased remuneration for labor performed is confidently expected. In imitation of the plan that has been so successfully adopted in the northern mining districts, the proprietor intends shattering the bank by a series of heavy blasts, and the work of running the necessary tunnels for that purpose will be immediately commenced. It is expected that the adoption of that mode of operations will greatly facilitate the working of the claim and add materially to its yield.

Brackett & Co., who for some time past have been engaged in running a new tunnel into their claim in Tunnel ridge, have reached the channel and are preparing to take out gravel. A drift is being run, lengthwise of the claim, up the ridge, and when completed a large force of hands will be set at work "breasting out." The gravel prospects finely, but it is so hard it does not wash freely. A battery has been purchased and will be put up in the spring and the gravel pulverized before run through the sluices. The mine has paid well for years and the indications are that as yet it is scarcely opened.

Veith & Co.'s hydraulic is in full blast, a large number of workmen being employed. Extensive improvements were made in the working machinery of the mine during the dry season that greatly facilitated washing. Double the quantity of gravel washed last season will be put through the sluices this year, and at a less expense. The only drawback to the rapid working of the claim is the great number of rocks that have to be removed. If some expeditious method of getting rid of them could be hit upon the mine would be one of the best paying in the district.

Moser & Co., owners of the sluicing claim in Spring Gulch, continue operations with unabated energy. At present they are engaged in washing new ground, high up on the sides of the gulch, as well as sluicing down the tailings that have accumulated in it for years. An immense head of water is used, at least two thousand inches. The bottom of the gulch has been uncovered for a long distance, and a clean-up will shortly be had. Ten thousand dollars, clear of all expenses, is the lowest estimate set upon the yield of the claim for the next few months.

Cook & Co., who lately purchased the ground at the head of Spring Gulch, are busily at work hydraulicizing. At present they are washing surface, preparatory to commencing operations in the hill. The claim, so far, has paid splendidly. A good deal of coarse gold is found. Pieces weighing from six dollars to an ounce were shown us, and the gravel is also rich in fine gold. Cook & Co. are experienced miners, and are getting their claim in condition to work to advantage. When it is fairly opened, we believe it will prove one of the best in this vicinity.

COST OF THE HOOSAC TUNNEL.—When the bore was started for the Hoosac tunnel, in 1857, the estimated cost for all the work was \$3,350,000. The tunnel is five miles long, and has already cost \$12,300,800, and will cost \$800,000 more to prepare it for a double-track railway. Taking Hoosac as a guide, the estimate for tunneling the Alleghany Mountains, to extend from the James river and Kanawha canal to the west, may be made, as the distance is about double, a thirty years of time and \$25,000,000 cost. But this would be less than the cost of irrigating five hundred miles of the eastern slope of the Rocky Mountains, as suggested by General Grant. This is a great country, but can't do everything "in all creation."—*N. Y. Express.*

You can't eat enough in one week to last you a whole year, and you can't advertise on that plan either.

Fatal Mining Accident.

The *Virginia Enterprise* of the 10th gives the following details of an accident which occurred in the Consolidated Virginia mine on the 13th inst., at 11 p. m.:

It appears that the shifts were being changed at the hour mentioned. Deceased and eight or ten other miners got upon the cage at the 1,200-foot level and came up to the surface. They were hoisted through the middle compartment of the shaft. When the cage reached the surface all of those on board stepped off in front, or on the east side, except Killen, who stepped off the rear or west side. After getting off the cage he started around by the north compartment to go to the office of the time-keeper, which is on the south side of the shaft. There was probably a considerable quantity of steam ascending from the shaft, which may have prevented his seeing clearly where he was going, as G. B. McCloskey, a miner, who was waiting to go down into the mine, states that he saw him step into the open shaft with his right foot, when he toppled over and took

The Fatal Plunge.

The fearful nature of the fall may be imagined when we say that that it was a sheer, uninterrupted, perpendicular plunge of 1,166 feet, though for convenience the shaft is generally spoken of as being 1,200 feet in depth. The force of such a fall is about the same as though a man was thrown a distance of 400 yards from the mouth of a cannon. In this north compartment, into which the unfortunate man was precipitated, a cage was at the bottom, and men were getting aboard of it preparatory to coming to the surface.

The Concussion Below.

When Killen's body struck the iron roof or bonnet of the cage, was tremendous. John Burns, a miner who was on the cage at the time, says he first heard the cable shaking, as though some one above had hold of it and was shaking it purposely. A man was about to ring the bell to hoist, when the body struck upon the bonnet of the cage. One of the feet of the deceased struck Mr. Burns across the shoulders as the mangled body rolled from the bonnet and fell out of the station. As the men were getting off the cage, Killen's dinner pail came down and struck upon the top of the cage. Dragging the body out, they found it so

Horribly Mangled.

As to be almost beyond recognition. The head was torn off and almost every bone in the body shattered to splinters and the limbs terribly lacerated. In order to get the remains to the surface it was necessary to sand up for blankets in which to envelop them. The sight was terribly shocking and sickening, and one such as but few except miners, often see. The remains were hoisted to the surface and then taken to the undertaking establishment of Mr. Andrews, on South C street, to be prepared for interment. In regard to

Who was to Blame.

For the shocking affair. We may here say that nearly every man who was examined before Coroner Holmes at the inquest held yesterday afternoon, testified that to get off the cage on the west side was against a strict standing order. The men had been informed that any one of them seen getting off on that side the cage would be discharged. They were to get off at the front or east side of the cage, when they could walk directly to the office of the time-keeper and give in their names. It seems there were no safety covers to the several compartments of the shaft. Had there been the accident could not occur, as all testified. The carpenters were making the necessary covers, but they had not yet been put in place. One had been made and put in place, but it had broken and was taken off. The new ones had been painted but were not yet dry. One of the witnesses gave it as his opinion, and it looks probable, that Killen got off the cage under the impression that he had come up through the north instead of the middle compartment of the shaft, and that he thus walked into the shaft while thinking there was nothing before him but the solid floor of the works. Deceased was a native of county Sligo, Ireland; was 33 years of age and unmarried. He had long worked on the Comstock lode, and was a man highly esteemed. He leaves a mother in Wisconsin and a sister in Scranton, Pennsylvania. His funeral will take place this afternoon at 2 o'clock, from No. 81 South C street.

JAPA MINES.—The *San Diego Union* has reliable intelligence from the new diggings in Lower California—the Japa mines: Mr. Kemerton worked in the prospect shaft on the main creek; and he reports that after six days' hard labor—day and night—the party engaged in sinking succeeded in reaching the bed-rock at a depth of thirty-one feet. The first prospect struck showed from two to five cents to the pan. The dirt was taken at a depth of from eleven to thirteen feet from the surface, the pay streak extending down to the bed-rock. This shows from eighteen to twenty feet of pay dirt in the shaft. When the bed-rock was reached the party struck it rich, but on account of the rapidity with which the water came into the shaft, they could only "coyote" around. They obtained from one "bit" to one dollar to the pan. There were in all about fourteen men engaged in working the shaft, all old miners, and well known here and in Julian City. The creek, for about two miles in length, has been taken up and located by the party and their friends, and they comprise nearly all the American miners now at work here.

The Japa Mines.

Southern California.

The San Diego Union of the 21st ult. has the following intelligence from the Japa mines:

These mines are supposed to be in the summit of the range of mountains extending southeast from Julian, in this county, into Lower California, and the altitude of the camp is estimated to be about 5,000 feet above the level of the sea. Japa is distant about 100 miles from San Diego, a little south of east. The road diverges from the Yuma Stage road, about sixty miles from this city, and from that point there is a continuous ascent into the mountains. The first diggings were struck at the point known as "Japa," but better placers were found at "Tres Pinos," three miles distant, and the entire population is now concentrated at the latter point. There is a small running stream at Japa, and dirt has been hauled thither to be washed, but the expense of hauling takes the bulk of the profits. These mines are as near to Julian City as to San Diego. They are forty miles southeast of Milquiatay, and forty miles north of San Rafael, in Lower California. A large gulch runs through the mining section, and into this débouché several smaller gulches. In these latter the gold is found. In the big gulch wells have been sunk to obtain water for washing in the rockers. The gold-bearing soil is red sand and granite gravel. The whole face of the country is covered with decomposed quartz, but no good bearing quartz has yet been found. Preparations are being made for a more extended exploration of the country. There are two men in the camp who were with a surviving expedition into the section inhabited by the Cocopah Indians. One of the Cocopah chiefs was lately in camp and said there was plenty of good quartz in his country, but that the white men must keep out of there. The Governor of the frontier, Villagana, was at the mines recently and said that the troops would soon be sent into the Cocopah country to remove the Indians, (who number about five hundred), when prospecting could go forward without danger.

Mr. Nichols thinks that for the next two years, industrious men can earn fair wages at these placers. All the washing must be done by rockers, as there is not water enough to run sluices or toms. The water is hoisted from wells. Two men are required for each rocker, one to hoist water and one to rock and feed dirt. The Mexicans are making from one dollar to a dollar and a half a day by their process of working. The Americans have made reservoirs on the small gulches, and are now waiting for more rain to give water for washing. It costs \$1.50 per load to haul dirt two or three miles to water.

The best diggings in the whole of that section have been found on the mesa three or four miles above the gulches. Four men have taken up claims there, and have a bed of red sand four feet in depth to operate upon. They have sunk a well, and have obtained four feet of water at a depth of fourteen feet; this gives them all they want to wash. A prospect shaft was sunk at Tres Pinos to the red rock, which was reached in twenty-two feet, when large boulders were struck on the bed rock a prospect of two or three cents to the pan was obtained. The water came in so fast that operations were abandoned. In the small gulches when the bed rock is reached, small crevices are found full of a very tenacious grayish-colored clay, and these crevices are always rich—real "pockets." Beyond these "pockets," the average of the diggings would be from one to three dollars a day to the man.

The country is well wooded, pine predominating. Game is plenty, deer being abundant and venison cheap. Beef is also very cheap, selling at eight cents a pound. There are three stores at the camp, and another is going up.

Louis Bronson came into camp on Tuesday night from Julian, which place he left on Monday last, 15th inst. He passed through three feet of snow in some places. He reported that several mines had caved badly. There are now about twenty Americans and one hundred Mexicans at the mines. The weather is very cold. The late storm continued in that section during ten days. On one day over three inches of snow fell. It freezes every night to the depth of half an inch to an inch in large bodies of water and from one to two inches in thickness in a bucket. The people live in brush huts.

NEW FACTORY.—Einstein Bros., boot and shoe manufacturers, of Battery street, purpose opening the largest factory in their trade on this coast. They have acquired a lot on Hayes street, between Polk and Van Ness, 136x155, and on a portion of this, 60x120, they are about to erect a three-story building, substantially finished and equipped with modern improvements and appliances. Detached from the main building will be a small structure for an engine, which is to supply power for the machinery. The total cost will be about \$40,000. The firm anticipates that it will employ from five hundred to seven hundred persons, of whom a large number will be white men, women and children. About four hundred persons are now employed on the upper floors of the Niantic Building, Clay street, and of these one hundred and fifty are Chinese. Einstein Bros. use the McKay sewing machine, and they have a patent in operation which materially lessens the consumption of material in the cutting of uppers for ladies' boots.

Panamint Mines.

So little is known respecting the Panamint mines, their location, mode of reaching them, or their immense extent and richness, that the writer, one of the discoverers of the district, offers the following to interest your readers. Panamint district is situated nearly due east from Lagunita P. O. and stage station on the Owens River road from Havilah—distant from Lagunita 60 miles, and from Los Angeles 215 miles; from Independence, the county seat, say 100 miles. It was formerly known as the Telescope district, in 1861 and 1862, and is a lofty, bold range of mountains, lying between Panamint and Death Valleys—the main peak called "Chimbe," in the native vernacular, rises to the probable altitude of 12,000 feet. The point of export and import for the mines will be Los Angeles, until the Southern Pacific Railroad has climbed Teahatopeha range and crossed the present Owens River road. Inside of sixty days there will be a good wagon road diverging from the main Owens River road at Desert Springs, and thence by the old Slate Range road, it will pass west of the large horax deposits, and crossing the low divide at the head of the valley by a recently discovered pass, it will reach within three miles of the mines, when more formidable difficulties will be met with in Surprise Canon. This will soon be surmounted, however, by a toll road, the company for which is now in course of formation, and the Panamint mines will have a good wagon road by the opening of spring, and the horax companies at Slate Range and Desert Spring marshes, a good means of export for their horax.

But little work has been accomplished during the summer just past, except a vigorous prospect of the district, the result of which has been the discovery and location of over 160 claims, and building by the miners of suitable winter quarters and roads to the mines. Now however vigorous work has been commenced by the owners, on the "Stewart's Wonder" claim, and on the Wyoming Company, by tunnel mining on the lodes.

Both the lodes mentioned above are considered first class, the ores assaying from \$200 to \$1,500 per ton, and averaging from 5 to 15 feet wide. A 15 foot shaft has been sunk on the Esperanza, and developed a very rich stratum of ore about 18 inches wide, which probably will pay \$600 or \$700 per ton.

The "Stewart's Wonder" claim changed hands a few days ago at the figure of \$20,000, without a pick having penetrated it six inches. Mr. A. P. Raines and partner, of San Francisco, are the purchasers, being men who mean business now, and a mill in the spring.

Nature has, in the Panamint District, saved the great expense and labor of prospecting by the usual slow and toilsome process of sinking shafts and running tunnels; a deep cañon from 400 to 600 feet in depth with an almost perpendicular wall, bisecting at right angles these wonderful silver leads for many miles. The miner can stand at the bottom of the cañon and see his mine as well and clearly defined, as well as its body of carrying ore, for 500 feet in depth (from the top where it is cut by the cañon) as he could if he had a shaft to that depth on his mine.

No mining expert has yet visited this mining district (and there have been many sent by mining speculators) who has not expressed wonder and astonishment at the immense amount of silver ore in sight; and several who have mined for years in the State of Nevada, have expressed the opinion that Panamint is certain in a few years, to eclipse, in the amount of silver yield per annum the famous Comstock lode of that State.—Cor. Havilah Miner.

Depth of Lake Tahoe.

The *Gold Hill News* says:—As many items have been published and exaggerated stories told relative to the depth of Lake Tahoe, we are pleased to be able to lay before our readers the following series of soundings made on the lake by John McKinney, so well known as an experienced navigator of those romantic waters, and resident of the western shore of the lake:

Locality.	Feet Deep.
Emerald Bay, five miles east, and—	
Yank's station, six miles north-east.....	900
Emerald Bay, one-fourth mile north-east.....	780
Rubicon Rocks, five miles east, and—	
Emerald Bay, five miles northeast.....	1,385
Rubicon Rocks, two hundred yards east.....	850
Rubicon Rocks, six miles northeast, and—	
Sugar Pine Point, five miles east by south.....	1,500
Sugar Pine Point, one mile south, near shore.....	760
Sugar Pine Point, three miles east by north.....	1,506
Sugar Pine Point, five miles northeast.....	1,540
Blackwood, five miles east.....	1,504
Blackwood, one-fourth mile east.....	700
Tahoe City, four miles east by south.....	1,350
Saxons' Mill, one-half mile east.....	772
Tahoe City, six miles east by north.....	1,524
Tahoe City, seven miles east by north.....	1,600
Observatory Point, five miles east.....	1,600
Observatory Point, four miles east by north.....	1,640
Hot Springs Point, four miles due south.....	1,645

From this point southward ten miles along the east side of the lake, three miles from shore, the depth averages from 1,200 to 1,400 feet. Along the western side of the lake, half a mile from shore, is a precipitous offset, almost like a perpendicular wall, from 700 to 800 feet in depth. It will thus be seen that the deepest place McKinney found was 1,645 feet; and at the northerly part of the lake, toward the Hot Springs section, he obtained his deepest soundings. At the middle of the lake he finds the depth about 1,500 feet. The above sub-aqueous statistics will be of great interest to the thousands of visitors who yearly resort to the finest of all mountain lakes in this section of the world.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

Alaska Mines.

"A shareholder" writes us as follows from Portland, Oregon, under date of Dec. 22: In your issue of the 13th inst. is an article, copied from the *Alta*, relating to the recent gold discoveries at Sitka, Alaska, to which I beg to make a few corrections. The specimens were not assayed at San Francisco, but at Portland, Oregon, with the following results: \$100.45 and \$276.15 to the ton, and other specimens were estimated—not assayed—by experts in Portland, to run as high as \$7,500 to the ton. The ledge lies on Cedar creek, near the head of Silver bay, about twelve miles south-east of Sitka. The association is styled the Alaska Gold—not quartz—Mining Company.

With these exceptions, the article is, in the main, correct; the ledge is no doubt rich, and only requires capital to work it. All the other circumstances for its development are unusually and peculiarly advantageous; plenty of timber and water, and what is of the most importance, easily "get-at-able," having deep water and good shelter for any number of vessels of any draught. Its climatic advantages are far superior to Montana, Idaho, Utah, Frazer River, or the newly discovered fields on the Stakkeen; as work can be prosecuted all the year round; this no doubt seems strange, considering its latitude, but it is nevertheless true, as any who have ever lived at Sitka will verify. Taking it altogether, it has natural facilities and advantages for the employment of capital, and its profitable development, seldom found connected with quartz mining.

Borax.

During the past year quite an excitement sprung up in this State and Nevada about borax mining, and numbers of men quit gold mining and went prospecting for borax. The excitement seemed to die away a couple of months ago and we have seen little about borax in the interior press until we came across the following suggestive item in the *Inyo Independent*, of the 27th ult:

A gentleman recently returned from a trip around the country gives rather a gloomy account for the immediate prospects of Columbias. There is nothing being done in borax, chiefly we suppose, for the reason that the market for that article is overstocked, and it does not pay to produce borax for nine cents per pound, all that it will now bring in San Francisco. But one mill, Sweetapple & Hazelton's five-stopper, is now running. A heavy Chicago company, it is currently reported and believed, design to soon enter largely into borax manufacture, market or no market. As the mines are very good, and the other mill only temporarily shut down, it is hoped that with this times will soon improve. Benton is as lively as usual and is steadily progressing, though but one mill was then running. The snow fall was a mere trifle in both localities, though the weather was very rough.

Advice from New York state that the borax market is firmer there with a diminishing stock; prices closed at 16 cts. About 1,000 cases of California were sold.

MINE SWINDLERS.—Dispatches from Sal Lake, dated Dec. 27th, state that two more parties were arrested and taken east that morning, on a charge of fraud in the sale of Utah mines. Officers are there from Kentucky and Ohio after others, but those accused have suddenly disappeared.

EXPLOSION AT A COAL MINE.—A serious accident occurred in one of the coal mines at Nortonville, on Saturday afternoon. The dust arising from the coal dumped at the bottom of the three hundred-foot chute ignited from a lamp and exploded instantaneously. Nine men in all were burned: D. Ferguson, dangerously; Ed. Williams, James Landrum, Demartine and others.

A HEAVY BLAST of 20,000 lbs. of Santa Cruz powder was exploded in the Smartsville Hydraulic mine, at Snicker Flat, on the 26th ult. The powder was placed on drifts under a bank of gravel over 200 feet high. It was a splendid sight to witness, and was a great success.

A BILL has been introduced into Congress, by Luttrell, appropriating \$100,000 to be expended under direction of the Secretary of War in "opening and improving the channels of the Sacramento and Feather rivers."

THE WATSON CO.'S MILL, at Mineral City, Robinson district, Nev., has shut down temporarily, on account of the severity of the weather.

THE artesian well, at the Benicia Arsenal, which has now been a year or more in progress, with the aid of the best machinery and appliances, has reached a depth of 600 feet.

SLUICING has been commenced by miners in Trinity county, though the supply of water is limited, in consequence of the cold nights keeping it back.

THE gold from the Japa mines, Lower California, is of a high standard.

NEW STEAMSHIP COMPANY.—It is announced that arrangements are in progress for the establishment of an American Transatlantic Steamship Company in New York. The names of the projectors have not yet been made public. It is proposed to construct a fleet of forty-five first-class iron steamers, built entirely of American material, each steamer having a capacity of 4,000 tons, and an average speed of fourteen knots an hour, with accommodations for 100 cabin and 1,000 stowage passengers. The company's bonds are to be made payable in twenty years, bearing interest at the rate of six per cent., payable semi-annually. It is said that the Government will be asked to guarantee the bonds and pay the interest to secure a good lien given on the vessels. The newspapers which publish the prospectus say the company propose to carry the foreign mails for twenty years, regular vessels being dispatched daily. It is also supposed that the vessels are to sail from New York, Boston, Philadelphia and Baltimore.

NEW STEAMERS.—The White Star line is building two immense vessels, the *Britanic* and *Germanic*, at Belfast, Ireland, which are believed to be the most powerful passenger steamers in the world, their tonnage being 4,750 tons each. The hull is made secure by eight water-tight compartments, extending from the keel to the upper deck. The arrangements for ventilation are novel. Besides the ordinary ventilator, an immense fan is used, by which hot or cold air can at will be driven through tubes to any part of the vessel.

The *Atlantic Monthly*, under the new management, is certainly an improvement on the issues of the past few months. The present number contains articles from the pens of some old *Atlantic* contributors, and one or two new ones. A strong paper, written by Prof. Agassiz, is one of the chief attractions, and perhaps as important as any furnished by that great man.

The *Quincy National* says the storms of the past three weeks have been the most severe of any that have occurred in that section for years, and there is not less than eight feet of solid, settled snow on the higher mountains. This insures a good water season for the placer miners, who are rejoicing over the prospects.

The International mill at White Pine is working successfully and turning out bullion.

KIND WORDS.

The Associated Reformed Presbyterian says—For years Perry Davis' Pain-Killer has been known as a most useful family medicine. For pains and aches we know nothing so good as the Pain-Killer. For many internal diseases it is equally good. We speak from experience, and testify to what we know. No family ought to be without a bottle of Davis' Pain-Killer.

Messrs. PERRY DAVIS & SON, Prov., R. I.—

Gents.—Although a stranger to you I am not to your invaluable medicine, Pain-Killer. I formed its acquaintance in 1847, and I am on most intimate terms with it still; my experience in its use confirms my belief that there is no medicine equal to Pain-Killer for the quick and sure cure of Summer Complaints, Sore Throat, Croup, Bruises and Cuts. I have used it in all and found a speedy cure in every case.

Yours Truly, T. J. GARDINER, M. D.

Judging by my own experience whoever once makes a trial of Perry Davis' Pain-Killer, will not fail to recommend it widely as an unequalled liniment, and valuable internal remedy for colds and various other complaints.—Every Month.

The efficacy of Perry Davis' world-renowned Pain-Killer in all diseases of the bowels, even in that terrible scourge, the Asiatic cholera, has been amply attested by the most convincing authority. Missionaries in China and India have written home in commendation of this remedy in terms that should carry conviction to the most skeptical, while its popularity in communities nearer home is ample proof that the virtues claimed for it are real and tangible. Among family medicines it stands unrivaled.—Boston Courier.

The *Saturday Evening Gazette* of Boston, says: It is impossible to find a place on this broad land where Perry Davis' Pain-Killer is not known as a most valuable remedy for physical pain. In the country, miles from physician or apothecary, the Pain-Killer is cherished as the exclusive panacea, and it never deceives.

"PERRY DAVIS' PAIN-KILLER is really a valuable medicine, and, unlike most of the articles of the day, is used by many physicians. It is particularly desirable in locations where physicians are not near, and, by keeping out at midnight for a doctor, a bottle should be kept in every house."—Boston Traveller.

"We have tested the PAIN-KILLER, and assure our readers that it not only possesses all the virtues claimed for it, but in many instances surpasses any other remedy we have ever known."—Herald of Gospel Liberty.

PHOTOGRAPH PAINTING done in the most satisfactory manner at 426 Kearny street, from the smallest card to full life size, on very moderate terms by EMILY R. EASTMAN, Artist, 426 Kearny street, San Francisco.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco.

GENEVA CONSOLIDATED SILVER MINE CO.—Dec. 25. Location: Cherry Creek Mining District and Egan Canon, in White Pine county, Nevada. Directors: Robert B. Gray, S. P. Kimball, George F. Gages, Charles Campbell and E. Hindman. Capital stock, \$5,000,000. The certificate states that the amount of capital stock actually subscribed is 26,000 shares, representing a par value of \$2,600,000.

HUMBOLDT M. CO.—Dec. 24. Location: Gold Hill, Nev. Directors: C. S. Neal, S. A. Chapin, E. R. Warr, H. O. Kibbe and D. L. Thomas. Capital stock, \$4,000,000.

FLORIDA S. M. CO.—Dec. 29. Location: Nevada, Capital stock, \$5,000,000. Directors: A. J. Monlder, E. W. Leonard, C. J. Pillsbury, Jesse Holladay and Oliver Eldridge.

INCREASE OF CAPITAL STOCK.—The Dayton Gold and Silver Mining Company filed a certificate of increase of capital stock on the 26th ult. The capital stock has been increased from \$3,000,000 to \$10,000,000. The debts and liabilities of the Company consist of the ordinary current expenses, and amount to \$25,000, the payment of which is secured by the property, earnings and income of the Company.

Meetings and Elections.

GOLD AND CURE S. M. CO.—Dec. 22. Trustees: J. O. Flood, Robert Sherwood, William S. Lyle, George Congdon, L. S. Rose, James G. Fair and Edward Barron. Andes S. M. Co.—Dec. 22. Officers: Edward Barron, President; James G. Fair, Superintendent, and Edward Landers, Secretary. This mine is situated in Virginia City, Nevada, and located on the Old Virginia or Burnside-Moscow Ledge, title, U. S. patent. The claim is situated directly west of the Ophir Central and Consolidated Virginia claims, and work will be immediately commenced to develop the property.

SUTRO S. M. CO.—President, Solomon Heydenfeldt; Trustees, Messrs. G. W. Grayson, E. M. Hall, George J. Ives and Wm. E. Miller.

HACKBURN GOLD AND SILVER M. CO.—Dec. 23. Trustees: F. Smith, Sargent Mathew, L. Chapeau, C. Guellimin, J. Verdier. Mr. F. Smith was elected President, and Paul J. Robert, Secretary. The office of the Company is transferred to No. 621 Clay street.

PITTS CONSOLIDATED M. CO.—OF PITCH.—President, M. J. Wilson; Vice-Presidents, H. Rosekrans, Thos. Devine, C. H. E. Smalley and H. R. West; A. F. Benjamin (re-elected) Secretary; O. H. B. Smalley, Superintendent.

GOLD MOUNTAIN M. CO.—President, E. J. Baldwin; J. B. Cavalier, Secretary.

MONITOR-BELMONT M. CO.—Trustees, Charles Mayne, Oliver Eldridge (President), J. D. Fry, J. W. Gashwiler, and J. B. Haggins; W. W. Hopkins, Secretary. The Company paid three dividends during the year, aggregating \$75,000—\$25,000 each.

SANDERSON GOLD M. CO.—Dec. 26. Trustees: H. Kozminsky, Wallace Everson, Homer Evans, H. B. Berryman and George Frier. Secretary, William Stuart.

HOW THE RICH MAY DO GOOD.—Thousands of the poor are suffering from coughs and colds caused by exposure. Send to each of these one bottle of *Hale's Honey of Horchmond and Tar*. Thus countless lives may be saved at a trifling cost. The remedy is admitted to be infallible. Crittenton's, 76th Avenue. For sale by all Druggists.

Pike's Toothache Drops cure in 1 minute.

Mining and Other Companies.

On account of the time necessary to mail the present large edition of the *M. & S. Press*, we are obliged to go forward on Thursday evening—which is the very latest hour we can receive advertisements.

BUNKER HILL QUARTZ MINING COMPANY.—Location of works, Amador County, California. Location of principal place of business, No. 19 First street, San Francisco, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 12), levied on the 12th day of November, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Wales L. Palmer.....	138	5	\$50 00
Wales L. Palmer.....	123	5	200 00
Wales L. Palmer.....	140	100	1,000 00
Wales L. Palmer.....	137	100	1,000 00
Wales L. Palmer.....	114	20	200 00

And in accordance with law, and an order of the Board of Directors, made on the 12th day of November, 1873, so many shares of each parcel of said stock as may be necessary, will be held at public auction, at the office of the Company, No. 19 First street, San Francisco, Cal., on Monday, the twelfth (12th) day of January, 1874, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. L. PALMER, Secretary.
Office, No. 19 First street, San Francisco, California.
de27

Black Mountain Coal Mining Company.—Location of principal place of business, City and County of San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 8th day of October, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Case, Iham.....	24	100	\$2 50
Cropper, (not issued).....	29	100	2 50

an assessment of 50 cents per share was levied, upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, Room No. 23, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 20th day of January, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHARLES E. BOGART, Secretary.
Office—No. 402 Montgomery street, Room No. 23, San Francisco, Cal. d613-w

Great Blue Gravel Range Company—

Location of principal place of business, San Francisco, Cal. State of California. Location of works, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 20th day of November, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

Machinery and Castings of all kinds.

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,

SACRAMENTO, Cal., January 14, 1874.

A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics Fair in San Francisco, was a First Premium and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 22d, 1871.

A. S. HALLADIE, President Board of Managers.

W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

WE BUILD AND HAVE CONSTANTLY ON HAND

The Largest Stock of Pumps in the World,

And for Every Conceivable Purpose.

SOLE AGENT ON THE PACIFIC COAST FOR THE

CLAPP & JONES SUPERIOR STEAM FIRE ENGINE,

Challenging the World!

THE CELEBRATED BOOMER PRESS,

For Wins, Cider, Lard, Paper, Wool, Hops, Hides, Tobacco, Rags, etc.—the Most Powerful in Use.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Fifty Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle as all other. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

All men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

VOLUME XXVIII
Number 2.

Antimony Reduction—No. 2.

In our last issue we made some remarks on the treatment of antimony and we now proceed to consider the extraction of metallic antimony direct from ores and also from the crude antimony. At present the greatest proportion of antimony is still obtained from crude antimony. For this operation there are two principal methods in use; that is, it is effected either by precipitation with iron while smelting, or by a combined oxidation and reduction process. The treatment with iron gives good results, but the antimony takes up some iron and requires subsequent refining. Besides the iron, sulphate of sodium (Glauber salt), is taken as a flux and some pulverized charcoal also added. Antimony and sulphide of iron are formed, which unite with the resulting sulphide of sodium. This salt forms a liquid cover over the metal and prevents its volatilization to a great extent. Soda in place of Glauber salt gives a less liquid flux and is, besides, more expensive.

The furnace used is similar to that shown in Figures 1 and 2 of our engravings. The concave bottom or crucible is beaten hard and made of a mixture of sand and clay, being provided with a tap hole. In this 100 parts of crude antimony are mixed with 42 parts of iron filings, and 10 parts of calcined Glauber salt, with an addition of 3 parts of pulverized charcoal, or with 50 parts of soda and 10 of charcoal. In eight or ten hours about 330 pounds of the antimony is melted in.

The smelting of ore for metallic antimony direct, suffers less loss than for crude antimony. Poorer ores, from 30 to 40 per cent., are smelted in shaft furnaces with three tynes. The furnace is 11 feet high from the tynes, 3 feet deep and 2½ feet wide. The ore is pulverized and roasted in a reverberatory furnace, one ton in six hours, and smelted with coke in the above shaft furnace. With poor ore the smelting in a shaft furnace is more economical than in a crucible furnace. For the purpose of smelting the ore in a reverberatory furnace, if no iron is used for precipitation, a careful roasting is required. This is best performed in a reverberatory roasting furnace, like that shown in Fig. 3, and the pulverized ore is introduced through the arch and stirred at a low heat until all the sulphur is driven out. The loss in roasting is, of course, very variable, but, with a careful roasting and proper ore, only from 1½ to 2 per cent. volatilizes. The roasted ore is then mixed with unroasted, oxidized ore, if such is obtained from the mine, and the whole mixed with from 22 to 30 per cent. flux (salt, Glauber salt and soda), and 15 or 20 per cent. of powdered charcoal, besides some slag from the former charge. The roasting furnace, as well as the smelting furnace, is provided with dust-chambers, where a part of the volatile antimony is deposited, which is also added to the ore mixture.

The furnace shown in Figs. 1 and 2 represents the smelting furnace. The crucible is lined with fire clay and when red hot the ore is charged up to 650 pounds, the door is closed for a short time and the fire immediately started. Much stirring is required for four or five hours and the scum is occasionally drawn out. After six hours the smelted mass is tapped and metal and slag run into a small hearth in front

of the furnace. When cold, the regulus is taken out, the slag separated and the antimony metal broken into pieces for further refining. The loss of antimony by this process is about 15 per cent. The refining process is mostly carried on in crucibles with a proper flux, which is the same as used for the smelting of ore, consisting of sulphate and carbonate of soda and salt. If there is arsenic in the metal, it is well to introduce from time to time a piece of saltpeter into the crucible and stir the mass with a clay stirrer. Mr. A. F. Wendt, in Canada, uses a large reverberatory furnace, 40 feet long and 9 feet wide. According to the

reduced metal and fluxes the gangue. In about four hours the furnace is at a bright red heat approaching whiteness, the whole mass is in fusion and active ebullition, and the carbonic acid penetrates the layer of slag as a blue flame. The charge is now repeatedly stirred until quite fused. The fire is then let down and the doors opened until the slag becomes thick and pasty, whereupon it is drawn out. As soon as it is removed, 25 pounds of salt-cake and 10 pounds of charcoal are thrown on the metal, and the fire again raised. In one hour and a half the slag is in a state of fusion as liquid as water. The metal is ladled into

Fig. 1

$\frac{11}{4} = 1'$

Fig. 2

Fig. 3

$\frac{11}{8} = 1'$

Fig. 4

FURNACES FOR REDUCING ANTIMONY.

Engineering and Mining Journal, which describes Mr. Wendt's furnace, it has ten working doors and holds five charges, three of 600 pounds of wet ore (concentrated) being introduced and drawn every 24 hours, so that the ore remains 40 hours in the furnace. Every five or ten minutes the ore has to be stirred to prevent agglomeration. The loss by roasting is 7½ per cent. Consumption of fuel, three-quarters of a cord of wood in 24 hours.

Mr. Wendt combines smelting and refining in one operation, which is a great improvement in reducing antimony ores. The crucible furnace is five feet in diameter and 18 inches deep. The flux used in smelting is a crude sulphate of soda in the form of salt-cakes and a charge usually consists of 500 pounds of roasted ore, 100 pounds of salt-cake and 75 pounds of hardwood charcoal, all in coarse powder. About one half of a cord of wood is burned at each charge. The ore is mixed with the charcoal and spread evenly in the retort furnace being covered with a mixture of salt-cake and charcoal. The fire is immediately increased and a fused layer is formed which protects the

dishes holding 25 pounds each, care being taken to dip enough slag, to cover the metal; when cold the slag is broken off and the metal is perfectly fine.

SAVING MONEY.—The report of O. C. Hewitt, Superintendent of the Keystone Consolidated mine, in Amador county, is to the effect that they have saved about \$5,000 per month by the abandonment of blankets and bundles and the use of Hendy's concentrators. The concentrators have been in use there about five months and of course give great satisfaction, as they have performed their work so well.

THE OROVILLE MINES.—The "Lava Bed" mines, near Oroville, continue to pan out to the Chinamen, by whom they are worked. The Chinese town near by is growing rapidly, and numbers of celestials are swarming thither.

The Gould and Curry, Hale and Norcross, and Imperial mines, are all down to the Sutro tunnel level, and exploring at that point. The Yellow Jacket is considerably below it, and the Crown Point has penetrated 200 feet below it.

A Startling Discovery.

Through the kindness of a gentleman of scientific tastes, residing in this city, we were permitted to see recent numbers of the *Monitor Belge*, which contain references to the reported discovery, by a Belgian peasant, of a fact which, if more substantially verified, is destined to cause a complete revolution in the preparation and use of fuel, and furnish a partial solution, at least, of the difficult problem which has so long confronted British economists. The statement is that it has been found that a mixture of coal slack, or waste screenings and dust, with clay, mud or other argillaceous matter, and sal-soda, may be made, which will cost one-half as much, and burn better, than ordinary coal. The ingredients are thoroughly incorporated, and taken in the following proportions: coal slack, twenty-five parts; earthy matter, seventy-five parts, and sal-soda, one per cent. The whole virtue of the preparation rests, it is said, on the action of the sal-soda. How this substance is capable of so assisting combustion as to consume such a dead weight of wholly inert matter, is another thing, and will puzzle our chemists to explain. A mixture, among the thousands constantly being patented, especially in England, consists of seventy-five parts of coal dust, and twenty-five parts of clay. This manages to burn itself, somewhat in the manner of peat, but is not so valuable as a heat-producer as the common coal, and is of questionable economy, inasmuch as the coal dust alone, or mixed with only enough water having clay in suspension to render the whole consistent, in the form of bricks, is much more effective. The trouble of weighing and incorporating so small a percentage is hardly compensated for by the trifling saving in material. But in the new composition, only one-fourth of the entire mass is coal. It would even pay to expressly crush block coal on this system, if all that is claimed be true. The discoverer, or inventor, has not patented his improvement, and its benefits are free to the world. It is further stated that manufacturers and other large fuel users in Belgium are making trial of the compound with satisfactory results. We await further and more detailed information before commenting at length upon this last sensation.

Rich Ore.

We have just been shown a sample of about seventy pounds of exceedingly rich ore containing free gold in abundance, taken from the Patterson mine at Tuttle town, in Tuolumne county. This mine belongs to Mr. J. J. Corrigan, (now on his way to London, England). He is the principal resident director here in San Francisco of the celebrated Richmond mine, at Enns, Nevada.

Mr. Corrigan deserves to be congratulated on his success in developing the Patterson, as he took hold of it in an undeveloped state and by sinking to a proper depth, and providing the necessary means and appliances, has made it an unbounded success. There is a 20-stamp mill erected on the ground and every thing bids fair for a large and steady yield of gold.

Mr. D. T. Hughes, the Superintendent, deserves great credit for the able and efficient manner in which he has opened this mine and brought it, within the period of one year, from obscurity to the position of one of the most promising mines in the state.

History of the Emma Mine.

The following article on the history of the famous Emma mine, from the New York Nation, will be read with interest by mining men on this Coast:

In the Little Cottonwood cañon, in the Territory of Utah, on the Wasatch range of mountains, and about sixteen miles from a station called Sandy, on a branch of the Union Pacific Railroad, is a little spot of ground whose fame, though the growth of only a few years, has already spread far and wide over the surface of the earth, and promises to be handed down to future generations, if not in song, at least in the records of financial and political ethics, as one of the most remarkable places on the surface of the habitable globe. In 1868, two prospecting miners, of the names of Woodman and Chisholm, wandering about through the cañon, suddenly became aware that on the side of one of the hills there were evidences of silver ore, and being, like most prospecting miners, though rough in manners and appearance, of an imaginative turn, they determined to consider their discovery a mine, and to name it after a lady with whom one or possibly both of them had been illicitly consorting in San Francisco, and whose Christian name was Emma. This they did, but, having no capital to work their discovery, it seemed at first that the christening of the mine might be all that would ever happen to it; when very fortunately, one fine day there appeared on the scene a certain James E. Lyon, whose business was that of a mining speculator, who agreed to join Woodman and Chisholm, and advanced them money, he receiving a one-third share in the mine as an equivalent.

How the Lode Ran.

During 1868 and 1869 one hundred tons of ore were got out, and Mr. Lyon, not being much pleased with the prospect of his enterprise, first, however, having satisfied himself that the lode ran in a northwesterly direction—a fact which we must beg the reader of this article to remember; for though the direction of a lode seems to be one of those things which would not be apt to escape the memory of any one interested in it, it will be observed throughout this strange tale that the business of silver-mining, at least in the Wasatch range, seems to impair the mnemonic almost as much as it improves the inventive faculties of the mind. To New York, then, went Lyon, having first made up his mind that the lode ran in a northwesterly direction; and, singular as it may seem, no sooner had he disappeared than the Emma became suddenly productive, a large body of ore was struck, and Messrs. Woodman and Chisholm, not caring so much for the niceties of partnership law as for silver, took in some new partners, and came at the same time to the conclusion that it was necessary to consult Mr. Lyon, on the ground that the vein now opened out was running in a different direction from what it was when the original shaft was sunk. Into the Emma Silver Mine of Utah these gentlemen had now organized themselves, and between Lyon and the Emma Silver Mine a suit-raged for three days in the District Court of Utah, in which were engaged no less than seventeen lawyers, and among them, as Lyon's principal attorney, the Hon. W. M. Stewart, Senator from Nevada. What Lyon desired was an inspection of the mine, in order that the defective memories of his former partners might be refreshed as to the direction of the lode. He gained his suit; on the inspection it proved that Lyon was right, and the direction of the lode was northwesterly. His suit was thereupon compromised; but, to understand the nature of the compromise, it is necessary to turn to other scenes and introduce new characters.

An Old Californian to the Front.

Vermont of late years has been the cradle of great men. From Vermont came Fisk; from Vermont came the gentlemen who have lately organized the Vermont Central Railroad; from Vermont, too, came Trenor W. Park; originally a country lawyer in that State, he came early to the conclusion that the confined life of New England was too narrow for a man of his metal, and he went to practice in San Francisco. Like most of the gentlemen who have begun their careers as country lawyers in Vermont and then emigrated to develop wider spheres of usefulness elsewhere, Mr. Park first really obtained distinction as a Receiver. It was the celebrated Mariposa estate which he received, and so well did he perform his duties that he is said to have acquired the name, among his friends and admirers, of the "Great Exhausting Receiver." It may be inferred from this that Mr. Park had acquired no small knowledge of mining law; and when we say that about March, 1871, he and one General Baxter made a careful inspection of the Emma, it is tantamount to saying that they came at once to the conclusion that the mine had been badly managed. To improve the property they purchased one-half of the mine, and when Mr. Lyon's compromise came to be arranged it was found that such had been their energy in developing its resources that they had already spent \$1,500,000 upon it, with no return. In any comprehensive scheme of improvement it was necessary that this money should be restored to them, and as neither Mr. Lyon, nor Messrs. Woodward and Chisholm had that amount of money on the spot, development could never be complete without a sale of the mine.

Difficulties of Making a Market for Emma.

But to place the mine on the Little Cottonwood cañon market was difficult, for the same reason that in the old English song the gentleman who put a rope round his wife's neck and took her for sale to the market town found it difficult to dispose of her. In the little Cottonwood Cañon the population were "all of them sellers." There were a dozen mines within easy reach, but there were no quotations in the Cañon. To people who were really interested in a comprehensive scheme of development, there was but one thing to do. The mine must be sold where money was plenty and the nature of cañons unfamiliar. The mine must be sold in London. The name was changed to the "Emma Silver Mining Company of New York," and Mr. Lyon was compromised with on the understanding that he should receive one-eighth of what the mine sold for, less the \$1,500,000 (which Messrs. Park and Baxter had theoretically expended in their first attempt at development), in consideration of his (Lyon's) holding over his claim till the 15th of November following, while a United States patent was being got out.

Dressing Emma Up for Inspection.

There must be an inspection and report upon the value of the mine by an expert, and in order that this report should be all that it ought to be, there must be some preparation of the mine. Mr. Silas Williams, it seems, is admitted by Mr. Park to be about the best man in his acquaintance to prepare a mine, and Mr. Williams was sent for. In the month of September the number of men working on the mine was reduced from a hundred to a dozen. No one was allowed to go into the mine without a written order, and armed men were stationed as guards at the entrances, while Mr. Williams occupied himself in plastering and engraving silver ore on to the limestone rock. The mine was now nearly worked out; there were 1,500 tons of ore raised and on hand, and the value of the mine was, in Mr. Park's opinion, at that time expressed, about \$250,000. The details of the preparation being arranged, Mr. Park and Senator Stewart sailed for England. Professor Silliman of Yale College had been through the mine, had seen the plastered walls, and made a very interesting and instructive report, for which he is said to have been promised \$5,000, and a second sum of \$45,000 if the sale in England was accomplished.

Mr. Park's Genius Developed.

The scene now changed to England, where we find Mr. Park and Senator Stewart, armed with Professor Silliman's report, trying, at first without success, to float their scheme. To investors, silver mines seem a little speculative, and the history of investments in Erie had not tended to strengthen public confidence in new and unknown American securities, promoted by old and well-known American speculators, even when reported upon by the "Sir Roderick Murchison of the United States." If Mr. Park had not been a man of real genius, the scheme might never have been floated to this day. But Mr. Park was a man of genius, and it occurred to him that if the new English company were headed by General Schenck, the American Minister in London, it would probably acquire a reputation at once. General Schenck having little or no money, it was arranged that money should be provided him, and that he should thus enter the company as a *bona fide* investor. This was no less important than the preparation of the mine by Silas Williams.

Emma's Appearance in London.

On the 9th of November, 1871, the prospectus of the Emma Silver Mining Company, limited, appeared, announcing the formation of a new company, with a capital of £1,000,000, in 50,000 shares, of which 25,000 shares were offered by subscription, the vendors retaining the other 25,000. The Directors were announced to be: George Anderson, M. P., London, Chairman; E. Brydges Williams, M. P., London; Deputy Chairman, Percy Doyle, C. B., London; E. Leigh, Pemberton, M. P., London; Hon. J. C. Stanley, London; Major-General Schenck, United States Minister, London; General Henry Baxter, ex-President N. Y. C. Railroad, New York; Trenor W. Park, President National Bank, Vermont; Hon. W. M. Stewart, United States Senator, Nevada. The Trustees were to be George Anderson, Major-General Robert Schenck, and J. H. Puleston (of Jay Cook, McCulloch & Co., American bankers), London. These gentlemen were to act as Trustees for the shareholders until the property purchased was duly transferred; and until that was done no part of the purchase money was to be paid.

Emma's Glowing Prospects.

The property meanwhile had greatly increased in value. There was, in the first place, cash, being the balance of accrued profits receivable from consignments of ore by the vendors to London and Liverpool, amounting to £46,300. There were 2,800 tons of first-class ore being forwarded to England, of the estimated net value of £70,000. There were 3,000 tons second-class ore, piled up at mine for smelting there, of the estimated net value £64,000. There were 13,250 tons first-class ore, already developed in various parts of the mine, of the estimated net value of £357,750. And there were also 2,600 tons first-class ore from mine to London expected to arrive during January and February, and to produce, net, £65,000. It was stated, also, that the ore previously sent to England had realized an average

of £37 19s. 3d. per ton. The cost of extracting the ore ready for shipment or sale had hitherto been under 15s. per ton, or only about 2 per cent. of its value—a fact unprecedented in the annals of mining. Judging by the profits of the preceding four months' working, the estimated net yield of the mine would be at the rate of £700,000 per annum; or, if smelting works were erected, as the proper business way to do, then the total profit would amount to the enormous figure of £800,000 per annum. Furthermore, with a view to equalize and insure the steady and continuous payments of dividends, the divisions of profits were to be restricted to 18 per cent. per annum, until £180,000, equal to twelve months' dividends, were in hand in London, after which time the whole of the earnings were to be divided among the shareholders.

The Game that was Played.

Mr. Park received £500,000 in cash, settled with Mr. Albert Grant (an English speculator, as expert in rigging the market as Mr. Silas Williams had shown himself in preparing, plastering and engraving) for £100,000, and a further prospective sum of £60,000 or £70,000 more, which he seems to have got afterwards, while with Mr. Jas. E. Lyon, entitled to one-eighth of the purchase, less \$1,500,000, a compromise was effected by which he got £30,000 for his whole claim. Mr. Park very kindly letting him know that a peculiar arrangement had been entered into, by which the whole of the London shares were locked up and inaccessible, in the hands of Mr. Grant, for nine months or more, and that before the expiration of that period, in all human probability, the "game would be played out" and the mine "bust up." Mr. Lyon being thus got rid of, the other old claimants renounced all their rights in favor of Mr. Park upon the payment of fifty dollars a share, and in consideration of an undertaking on the part of Mr. Park to make up to the new London company for any discrepancy between the actual amount of first-class ore and the 2,800 tons mentioned in the prospectus. It is hardly necessary to say that as there were only 1,800 tons of this ore in existence, Mr. Park at once paid over to the London Emma Company £28,000, and the London Emma Company entered the payment in their books as received for "missing ore."

Schenck Draws Out.

After this everything went on beautifully. There was to be sure, here and there an adverse rumor in circulation; and General Schenck was obliged to resign his position as Director; but this was only a matter of diplomatic etiquette, and had nothing to do with the merits of the mine; and the 18 per cent. dividends now began to be paid, together with an announcement from the Directors that they had "taken great pains to verify every statement in the prospectus," and were "convinced in their opinion" that such statements were "strictly accurate." The production at the mine went on increasing, for on the 1st of February, with the monthly dividend, came a statement of "ore sold at Utah, 1,000 tons—£28,000," which was the same quantity short from the 2,800 tons which is referred to in the prospectus as "now at railway station, en route to London." On the 7th of March a meeting of the company was held, at which G. Anderson, the Chairman, stated to the shareholders that silver was coming out of the mine so fast that it seemed very likely that they would get "30 or 40 per cent. instead of 18."

How Reports were Cooked Up.

Meantime, to dispel the rumors which had sprung up about the company, Mr. Park offered to pay the expenses of the whole of the Board if they would only go out to Little Cottonwood Cañon—if they would only go out and examine the property for themselves. This they did not care to do; but Mr. Brydges Williams did, receiving a check for his trouble of £5,000. With Mr. Williams, as a personal friend, went Mr. G. A. Lawrence, better known as the author of "Guy Livingston" and other works of fiction; and the result of his connection with the enterprise is a very agreeable instance of how much any development of the resources of nature benefits not merely those directly interested, but all classes of the community. Mr. Lawrence, a literary man, and not skilled in mining, was much struck with what he saw in Utah, and on his return wrote a book called "Silverland," containing a chapter devoted to the Emma mine, for which he received a thousand guineas from his publishers, while his expenses were paid by his friend, Mr. Williams. One of the malicious rumors about this trip was that Mr. Park sent word out that Mr. Williams was to have a home provided for him both in New York and Utah, and that he was on no account to be allowed to go anywhere near a hotel or converse with suspicious characters.

Floating the Shares.

With Mr. Williams went Mr. Stewart and Professor Silliman, and the reports received from the mine were so favorable that, on the 1st of April, 1872, the directors invited the stockholders to take the locked-up and inaccessible vendors' shares, the directors being desirous of getting a quotation on the Stock Exchange, and it being necessary for this that more shares should be held by the Company itself. The only difficulty, they said, was about the price; but they had succeeded in inducing the vendors to dispose of shares at £23—the market price. The shares were taken, or taken in great measure, and everything went on even more swimmingly than before, although, strange to say, no quotation was granted. The

papers stated that "the directors would be in possession of the £180,000 reserve in a few days, and would then immediately commence paying 36 per cent. dividend." A pamphlet by "Nummus" appeared, called "Mining Enterprise in America, as illustrated by the History of a Great Investment," which was printed by a respectable publishing house, Messrs. Cassell, Petter & Galpin, and in some way seemed to have been published by them, though it was not, and they knew apparently nothing about mining enterprise in America. Extracts from this were made in such papers as the *Mining World* and *Stock Exchange Review*, and sent free to every stockholder.

Mr. Williams' Rosy Report.

On the first of May, the Directors announced the return of Mr. Williams with highly satisfactory accounts, and a meeting was held on the 7th of that month to hear them. Mr. Williams, having lost his father, could not attend it; but a letter from him was read, in which he expressed the opinion that the property was "honestly worth more than double what it was three months ago," while Mr. Silliman's second report said that the recent discoveries were "a guarantee for the future of regular and satisfactory dividends;" and on a stockholder venturing to inquire if he might be informed "what amount of ore was actually in sight, seen and measured," the Chairman, Mr. Anderson, advised him to read the reports and he would find that Professor Silliman vouched for 32,000 tons. On the 1st of November, the Directors announced the quantity of ore raised to date as 10,190 tons. The monthly dividends went on, the thirteenth being paid on the 2d of December, 1872, and, on the 10th of that month, Mr. Anderson made a report, detailing his visit to the mine, giving a glowing account of the property (the ore raised was 11,420 tons,) and paying a high tribute to the loyalty and disinterestedness of Messrs. Park and Stewart.

The Sad Downfall of Poor Emma.

With this gratifying tribute, the history of the Emma mine may be said to close. To be sure, there is an appendix in the way of charges and explanations and balance-sheet and proceedings by stockholders, but these are proceedings relating to individuals, their private fortunes, their integrity, and so on. But, as a mine, Emma on the 10th of December, 1872, ceased to exist. There were no more dividends, there was no more ore either in Utah, or in New York, or in London, or on the high seas, to arrive. The 32,000 tons vouched for by Professor Silliman had disappeared; so had the 11,420 tons raised; so had the £46,300 "cash on hand," which was an imaginary sum paid over first in the purchase money to the vendors, and repaid the next day to the company; so had £195,000 in dividends, the money for the last two of which, it seems, had been lent to the company by Mr. Park, as it was itself insolvent; and, in fact, the mine had netted about £47,000 from the 8th of November, 1871, to the 31st of December, 1872. Meanwhile, it appeared that the company had been mining on ground not their own. It will be remembered that the mine ran north-west and south-east, but the company which got the patent discovered that in a north-west and south-east direction there were other claims—the Illinois, the Cincinnati, the San Francisco Emma, and the North Star, all working close by. So in order to avoid this difficulty the patent was taken north-east and south-west, while the mining was done north-west and south-east—in the true direction of the lode. By this arrangement they secured a good title in their patent and at the same time it did not in reality make very much difference which way it was worked, for it would "bust up," as Mr. Park said, in a few months at any rate. In this way they mined their way into land of the Illinois company, and the balance-sheet disclosed the fact that they owed the Illinois company £18,000 on this account, which they reduced the £47,000 to £29,000. As to the quantity of ore remaining in the mine Mr. Park says: "No one can tell as to the quantity of the ore remaining in the mine save Him who made;" this being supposed to have a pious reference to the Creator of the Universe.

Who Tells the Story.

There are one or two more things which it is necessary to state in order to explain the nature of the source from which this information now comes. In November, 1871, one S. T. Paffard, having a little money to spare and seeing a notice of the Emma Company in some newspaper, obtained a prospectus and became strongly impressed with the statements contained in it, vouched for by such names as it bore, and especially by the name of General Schenck, the United States Minister. Being desirous of adding to his income, he took such shares as were within means, not on speculation, but as an investor. When the bubble burst he determined to find out why it was that shares were worth £3 which had been worth £23, and he has spent much time and trouble in correspondence and examination, and has in the end got together the real history of the enterprise in a little pamphlet dedicated "To the shareholders of the Emma Silver Mining Company (Limited), and to shareholders in mines of a similar nature in Utah and Nevada." He gives, in an interesting and instructive appendix, his correspondence with the eminent gentlemen connected with the enterprise, and, with a hopefulness which is certainly to be commended in one who has bought his experience so dear, he takes as the motto of his *True History of the Emma Mine* "*Magna est veritas et prevalebit.*"

SCIENTIFIC PROGRESS.

Zodiacal Light.

Mr. E. H. Pringle writes to *Nature*, from Camp Udopi South Canara, upon the subject of the zodiacal light, as follows:

It is a matter for regret that with the magnificent opportunities of investigating the character of the zodiacal light, afforded to Maxwell Hall by his elevated position in Jamaica, he does not seem to have brought the powers of either the spectroscope or polariscope to bear on it.

I think the full importance of the inquiry is hardly appreciated by many. Taking the generally accepted theory of the light—that of a lens-shaped disk of luminous matter, with the sun for its center, and a diameter exceeding that of the earth's orbit—its matter, lying as it does, in the plane of the elliptic, actually connects us with the sun, and may be the medium through which the solar magnetic forces act upon our own.

The intimate connection between solar outbursts, auroras, and terrestrial magnetism is an established fact. To the aurora, the zodiacal light is by many conceived to be nearly allied, and I do not think the evidence hitherto adduced against this theory is at all conclusive. The remarkable wave of light seen by Maxwell Hall is strongly in favor of it; and though spectroscopic observations seem to point the other way, they are yet so scanty in number that it would be as unfair to argue from them the want of connection between the two phenomena as it would be to assert that the planets have no volcanic fires of their own because they only give us a reflected solar spectrum.

Assume the zodiacal light to consist of solid particles of matter—planet dust—shining by reflected light, and it is not difficult to imagine the aurora playing amongst these tiny worlds, each of which might have its own small magnetic system, swayed like our own by the master magnet, the sun.

So far as my own experience goes I can see no objection to this assumption. Though I have seen the light very brilliant in both its branches, I have never yet found it to have a decided outline. Nor have I been able to trace it either east or west to 180° from the sun. Granting that this can be done, however, the apparent vanishing point of the earth's shadow lies comparatively near us, and far within this area is the point at which the shadow would subtend only a degree or two of arc, and at which it would be very hard to discern amid the feeble light of this portion of the zodiacal light; so that a slight extension of the diameter of the disk would remove any objection that might be raised under this head.

Imagine one of Saturn's moons revolving in an orbit within its belts, and fairly imbedded in the matter, which, for the sake of the argument, we must assume to be illuminated by the planet. To inhabitants of that satellite each night would bring a phenomenon closely resembling our zodiacal light, only far more brilliant. At midnight two cones of light would taper upwards east and west, and meet overhead. The brightest portion of each cone would be that along the axis and nearest the horizon. Towards the summit and on the borders, where the line of sight would lie through less depth of matter, the light would gradually fade away, but from the satellite being imbedded in the belt, the entire sky would be more or less luminous.

Has it not been noticed on our earth that, when the zodiacal light has been seen unusually bright, a "phosphorescence" of the sky was everywhere visible? May this not arise from our solar belt in a somewhat similar manner?

From my personal observations I see no reason to give a jentacular form to the disk. Parallel faces would afford a perspective such as the zodiacal light appears to me.

I would urge observers who may be fortunately situated, not to neglect opportunities. So far as I am able I shall do my best to aid the work of inquiry, and with the powerful instruments that Browning is forwarding me, placed at an elevation of more than 6,000 feet, under the clear skies of our Indian winter, I trust I shall be able to add something to our knowledge of the zodiacal light.

MAONESIA.—The Washington factory near Newcastle, manufactures the greater part of the magnesia used in the world. The principle of the process employed consists in treating dolomite with gaseous carbonic acid, under a pressure of five or six atmospheres. The dolomite is first dried, then finely pulverized, and afterwards placed with cold water in a cylinder, which constantly revolves on its horizontal axis. The carbonic acid gas, formed by the action of hydrochloric acid upon carbonate of lime, by a powerful pump, driven into the vessel at the pressure above noted. The solution of bicarbonate of magnesia thus produced is carried into a vertical cylinder, and submitted to steam (the consequent elevation of temperature regenerating the neutral carbonate), and then led into canals beside the last mentioned receptacle. Lastly, the substance is gathered into masses, from which are cut the parallelepipeds which, after desiccation, are supplied to commerce. Caustic magnesia is obtained by heating the carbonate in red hot muffle furnaces.—*Jour. of Applied Science.*

Electrical Apparatus for Exploding Torpedoes.

The well-known electrician, Mr. Moses G. Farmer, has, according to the *Boston Journal of Chemistry*, constructed a magneto-electric apparatus for exploding torpedoes, which is so perfect and certain that any naval officer who fails to explode a magazine upon the first trial, even under the most unfavorable circumstances, is liable to be tried by court martial for incompetency. The apparatus is very compact, being contained in a stout box not more than fifteen inches in diameter. The electrical currents are produced by turning a crank connected upon the outside with an axle, on which revolve a series of electro-magnets of peculiar construction. Two or three revolutions are sufficient to heat a platinum wire to redness a dozen miles away, and a fine iron wire, several inches in length, is fused by it in a dozen turns. But the striking peculiarity of this machine consists in a device by which the current can be sent through the charge without exploding it; and an electro-meter or deflecting needle is attached, so as to show the operator that the connection is complete before the charge is exploded. The perfection, accuracy, and success of this device, are remarkable, and place our Government in advance of other nations in effective torpedo management. A large number of these machines are now supplied to the naval department of the service, and doubtless their use will add greatly to the defensive means of fortifications, whether in harbors, on the coast, or on the island frontiers of the country.

TWO HUNDREN YEARS AGO.—The history of coal gas is attended with some strange incidents, which indicate very clearly that for the application of a scientific fact to practical purposes everything must be ready for the innovation, else it will be useless to attempt to force its introduction. The inflammability of gas obtained from coal was a well known long before the idea was entertained of turning it to practical use. The miners in the coal regions of Europe were long familiar with the inflammable qualities of the fire-damp, and very correctly attributed it to the gaseous exhalations of the mines. As early as the latter part of the seventeenth century, Dr. Clayton actually made coal gas, and described its properties very correctly. He distilled coal in a retort, and, to use his own words, the result was "phlegm, black oil," and a spirit which he was unable to condense, but which he confined in a bladder. These products would be now designated respectively as water, tar and illuminating gas. Clayton several times repeated the experiment, and used to amuse his friends by burning the gas as it came from the bladder through holes which he pricked with a pin.—*Am. Exch. and Review.*

HEAT-CONDUCTING POWER OF ROCK.—Prof. Herschel and M. Lebour have been experimenting in this subject. Twenty-eight specimens of rocks were reduced to uniform circles of five inches diameter and half inch thickness, carefully gauged. Out of six specimens that had been tried, slate plates, cut parallel to the plane of cleavage, transmitted the heat faster than any of the others. Where the flow of heat had become uniform, the water was raised 10° Fah. in thirty-two seconds. With marble, sandstone, granite and serpentine, about thirty-nine seconds were required to raise it by the same amount. The greatest resistance to the passage of heat was offered by two specimens of shale, gray and black, from the coal measures in the neighborhood of Newcastle, which occupied forty-eight or fifty seconds in raising the water one degree, or half as long again as the time taken by the plate of slate.—*Scientific American.*

FLAMMATION, in his work on "The Atmosphere," gives the extremes of temperature at different places on the earth, as follows: in no place, at an elevation of two or three yards above the surface of the ground, and in a sheltered position, has the temperature ever been known to exceed 135° , or go lower than -73° , giving a difference of 208° , a greater difference than between the freezing point and boiling point of water. The greatest recorded difference at any one place being at Yakouts, their warmest being 86° , and the coldest 72° below zero. The most equable climate being at the island of Pulo Penang, where the thermometer only varies 14° —from 76° to 90° .

IMPROVEMENT IN PHOTO-LITHOGRAPHY.—M. Paul proposes the substitution of albumen for gelatin in the bichromate process. The paper is covered with a thin layer of albumen, to which a concentrated solution of bichromate is added. After a sufficient exposure under the negative, the sheet is covered with lithographic ink and then immersed in cold water, in order to dissolve the unaltered albumen, which is removed by fine sponge. A very clear image, it is said, is thus obtained, ready to transfer to the stone.

NOVEL GAS-KINDER.—Prof. Bottger has succeeded in igniting a jet of ordinary coal gas in the following manner: The gas was allowed to issue from a finely-drawn-out glass tube and strike against a few grains of finely-powdered, dark-dry permanganate of potash, which is moistened with concentrated sulphuric acid. The gas ignites with the rapidity of lightning.—*Journal of Applied Chemistry.*

MECHANICAL PROGRESS.

Bridge Building.

Mr. J. M. Goodwin, of Cleveland, Ohio, has lately patented certain improvements in bridge construction, which are described as follows in the specifications: "The object of my said invention is to relieve the principal girders, chords, side or middle trusses or beams of bridges, and girders, beams of trusses used in structures other than bridges, of the action and effect of loads moving along or over them, technically known as 'rolling loads'; and to cause the stress of any load passing along or over, or distributed unequally upon, any bridge or structure in which said invention or device is used, to act always in a direction nearly absolutely vertical, and practically vertical, upon one certain surface, and at the same time to cause the stress of such rolling loads to be brought upon such surface or surfaces by a gradual accumulation, the stress upon such surface or surfaces of the principal girder or girders, acting at all times in a direction practically vertical, as aforesaid, and with a force always in proportion to the distance from the ends of the bridge at which any load upon the supplementary girders aforesaid may be (the said load being in this connection considered as passing from end toward center, the force only, and not the character, of such stress being changed by the changing of the position of the load), thereby removing from the principal girder or girders those undulatory and otherwise disintegrating disturbances of fiber which are produced by the direct action of rolling loads; and also to cause the stress of any unequally distributed load to be transmitted to the principal girder or girders aforesaid, through the surface or surfaces, and in the direction, nearly and practically vertical, hereinbefore specified."

Cast-Steel Railway Axles.

A writer in the *Annuaire*, a French periodical, strongly advocates the use of cast-steel axles, on the ground that, when it is of good quality, such material will safely stand twice the strain of wrought iron, and its bending and breaking moments will be in the same proportion. Calculating from these data, he says that the diameter of a steel axle, compared with that of a wrought-iron one, will be as four to five, and its weight only five-eighths of that of the other. Another advantage enumerated of employing this material is that the diameter of the journals may be diminished in the ratio of 0.706; and a steel journal will also bear a greater pressure per square inch of surface without heating than one of iron. The result of using a smaller sized journal is to diminish the haulage, which in every vehicle varies directly as the proportion between the diameter of the journals and that of the wheels. The weight of a steel journal is about three-quarter that of an iron one. By the adoption of steel axles there is also no necessity for making the wheel-bed, and consequently, the nave of the wheel, so long. The length of this part of the axle has not much influence upon the strength of it, provided the diameter be increased slightly in excess of that immediately behind it, and that the junction between the wheel and the axle be thoroughly well secured. The fixing of the wheel on the axle has, also, a very considerable influence upon the strains. If the nave be short, and no keys be used in the connection, the tension must be proportionately great per square inch of surface of contact. Again, the "grinding" of the flanges of the wheels occasions a particular pressure on this part of the axle, and tends to shear it with a force inversely as the length of the bearing, but this may be mitigated by rounding the exterior edges of the nave of the wheel.

AMERICAN LEATHER CLOTH.—The mode of manufacturing this cloth is said to be the following: A piece of cotton texture is passed between two cylinders, the upper one of which permits a mixture, consisting of oil, resin, lampblack, and other matters to flow upon the slowly-moving canvass. From the cylinders the fabric is wound upon a drum made of wooden sticks so arranged that the successive layers are kept apart from one another. When the whole piece has been wound upon the drum, the latter is placed, with the oiled cloth on it, in a drying chamber. After drying, the cloth is smoothed by means of pumice stone, and passed a second time through the cylinders, receiving another coating of varnish. It is then dried, and these alternate operations repeated at least five times, in order to make the coating sufficiently thick. The final process is pressing the cloth so as to give it the appearance of natural leather.

METEOROLOGY OF SAN FRANCISCO.—From observations taken at the United States Signal Office in this city it appears that during 1873 the mean barometer for the year was 30.04; mean temperature, 55.07; highest temperature, 79; lowest temperature, 41; total rainfall, 18.55 inches; prevailing wind, southwest; highest velocity of wind attained, 48 miles per hour; number of days in which rain fell, 64. For December the highest barometer was 30.33, and the lowest, 29.55; the highest thermometer, 59; the lowest, 44; the total rainfall, 9.72 inches; the prevailing wind, southeast, and the number of rainy days, 17.

Progress in Glass-Making.

Siemen's regenerative process for melting of glass has proved very successful, and has been introduced in some of the most extensive manufacturing in Europe. By means of its use the amount of smoke is greatly diminished, the color of the glass is improved, a greater control is obtained over the furnace, and a saving of fuel is effected wherever, by this process, slack can be substituted for large coal or lumps, such as is at present so largely in use. Should the expectations in regard to the use of this furnace for the melting of glass be fully realized, the gain in that manufacture will be very great, and the process will fully supplement those other improved methods which have brought glass-making to its present state of advancement. The substitution, some years ago, of carbonate of soda as the alkaline ingredient in glass, in place of kelp, and, subsequently, for crown and sheet-glass of sulphate of soda, in place of carbonate, was but the beginning, though a most important one, of improvement in this direction. This was followed by an increased size and better workmanship in the plates, sheets and tables, and by an improvement in the color of glass by use of purer materials and by modifications in the manner of melting. Numerous changes soon took place in the operation of flattening glass, resulting in the removal or diminution of many imperfections in glass; and to these succeeded the use of the diamond in the splitting of cylinders in the place of a red-hot iron, also an increase in the size of melting-pots and furnaces, with the view of economizing coal and labor, and the adoption, in the casting of plate-glass, of various mechanical contrivances. Finally, the use of the same pots for the two processes of melting and casting plate-glass superseded the old method of transferring the contents of the melting-pot into the vessel used for casting; and then small coal or slack was substituted, in the melting process, for large coal or lumps.—*Paint and Oil Trade.*

Constructing a Piano.

A writer has taken the trouble to give the actual material used in constructing a piano-forte. In every instrument there are fifteen kinds of wood, namely: pine, maple, spruce, cherry, walnut, whitewood, apple, bass-wood, and birch, all of which are indigenous; and mahogany, ebony, holly, cedar, beech and rosewood, from Honduras, Ceylon, England, South America and Germany. In this combination elasticity, strength, pliability, toughness, resonance, lightness, durability and beauty are individual qualities, and the general result, is voice. There are also used of the metals, iron, steel, brass, white-metal, gun-metal and lead. There are in the same instrument of seven and a half octaves, when completed, two hundred and fourteen strings, making a total length of seven hundred and eighty-seven feet of steel wire, and five hundred feet of white (covered) wire. The total number of strings, when properly stretched to produce the right tone, exert a pull of over ten tons; this represents the force with which the piano is drawn towards the other end, and it explains the reason why good pianos are built so strong and so heavy. Such a piano will weigh from nine hundred to one thousand pounds, and will last, with constant use, (not abuse,) twenty to twenty-five years.

CHINESE METHOD OF PRINTING.—Among the Chinese, having some 8,000 different letters, type-foundries are out of the question, and consequently there are no type-setters among them; but they follow the primitive way of printing from engraved wooden blocks. The matter to be printed is first written by means of transfer ink upon thin paper, and this is pasted face downward upon a block of a pear or plum tree. When dry, the paper is rubbed with care and leaves behind an inverted impression of the characters. Another workman now cuts away all the blank spaces by means of a sharp graver, and the block, with the characters in high relief, passes to the printer, who performs his work by hand. The two points that he has to be most careful about are, to ink the characters equally and to avoid tearing the impression, by means of a brush similar to our proof-brush. Printing-presses are not used. Proclamations, visiting-cards, etc., are printed in the same manner. An economical way of printing small hand-bills and advertisements for walls is to cut the characters in wax instead of wood; but they soon get blurred, and the printing from them is almost illegible. From a good wooden block some 1,500 sheets can be printed, and when the characters have been sharpened up a little, it is possible to obtain 8,000 or 10,000 more impressions.

They claim to have practiced this method more than four thousand years ago, while we commenced to print from wooden blocks only in the fourteenth century.—*Artisan.*

PLATINO WITH ZINC.—According to Bottger, copper and brass may be given a firmly adherent coating of zinc by the following method: Finely divided zinc is placed in a non-metallic vessel and covered with a concentrated solution of sal-ammoniac. This is heated to boiling, and the articles of copper or brass, previously cleaned, are then introduced. A few minutes suffice to produce a firm and brilliant coating. The powdered zinc is prepared by first melting the zinc and then pouring the molten metal into a mortar and triturating it until it solidifies.

New Incorporations.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. E. Journals.

For 6 days ending Wednesday, Jan. 7, 1874.

Our Weekly Stock Review.

THURSDAY, Jan. 8, 1874.

Stocks have been "booming" this week until to-day when most of them came down a little from their elevation. Yesterday, there were some signs of abatement in the excitement of the past few weeks. The activity that has prevailed has been based upon the developments in a few good mines, but their prosperity has as usual, carried up the "wild cats" also. The Comstock's are all in good condition. The Ophir development is said to be a *bona fide* one. The Consolidated Virginia ore body shows improvement; the Hale & Norcross Company expect to develop something interesting shortly at their lowest level; the B-icher shows better than ever, and the important development of a fine body of very rich ore at the 1,400-foot level of the Crown Point further north than heretofore, adds one-third to the value of that mine. The general outlook for mining, milling, business, and the general interests of the country are most acceptably cheering.

The present decline is accounted for very reasonably by leading operators about as follows: During the month of December, when taxes, etc., were supposed to be in course of settlement, there were a large number of operators who, understanding that a spring rise was sure to take place in January or February, supposed that they were stealing a march on the outsiders by investing before money could be concentrated by the public in January; and the consequence was a large surplus of cash, which is carried by this class of operators, was put into stocks of all descriptions upon the supposition that thirty days' time would find a great demand for their investments; this causing an unprecedented rise, drew in small operators, who, when orders became scarce, got alarmed, and threw what they had into the market, already made weak by lack of orders. In the stock market "it never rains but it pours;" therefore, those who intended buying are scared off, producing a break.

A new mining company has been formed under the name of the California Mining Company, to work the six-hundred feet level on the Comstock Lode, adjoining the Ophir on the south. The claim embraces the Central, California, Central No. 2, and Kinnear ground, and by many is believed to be the most valuable portion of the Comstock. With a fine body of ore plunging into it from the Ophir on the north, and full

developed in the Consolidated Virginia on the south side of the river. This new claim must be of great value. We are informed that work will be commenced on it at an early day through the Consolidated sbatt. By the terms of the consolidation the California Chmpany's stock is distributed as follows: Nine-tenths (9-10) of one share for each share of Central No. 2, and two and one-half (2 1/2) shares for each share of Central, and balance, that is 7-12ths of the whole, to the Consolidated Virginia. The stock of the Consolidated Virginia is not affected by this arrangement, so far as relates to the ground between the Kinner and Bestand Selcher.

A stock dividend 7-12 of a share of the capital stock of the California Mining Company upon each share of the capital stock of the Consolidated Virginia Company, has

The only dividend declared thus far this year is that of Belcher, which is \$5 per share, aggregating \$20,000. There are eight in this mine is worth twenty months' dividends of \$3 each—\$1,000,000, or \$100 in per share for the Ophir fall from \$30 Tuesday \$25, but \$60 per share. Yellow Jacket came down \$20. Chollar, Overman and Hale and Nurecross, each \$10. Savage, \$20; Segregated Belcher, \$35; Alpha, \$15, and so on. Mines of real merit, like the Belcher, Crown Point and Consolidated Virginia, hold their own heavily. The partial waver of the Comstocks turned attention to their districts, and the Idaho stocks particularly were firmer. Belmont is in disgrace, having come down in its price because ore assaying \$1,000 per ton only.

The advance and decline of stocks for the week will be seen by reference to our stock tables.

Meetings and Elections

MINERS' PROTECTIVE ASSOCIATION.—President, J. D. Wheeler; Vice President, H. Schirring; Financial Secretary, H. Suhling; Recording Secretary, J. W. Buffum; Treasurer, H. Meyers; Trustees: A. N. Nelson and Wm. Slevers.

NONRU STAY.—At a meeting of the Board of Directors of the North Star Tunnel and Mining Co., Moreville Ridge, Butte Co., Cal., the following officers were elected for the ensuing year: Arthur Quinn, President; John Maskell, Treasurer; F. J. O'Reilly, Secretary.

PIUTE.—At the annual meeting of the Piute S. M. Co. H. R. West, Dr. M. J. Wilson, Thomas Devine, Hiram Rosekrans and C. H. B. Smalley were elected Trustees for the ensuing year. The Board organized as follows: Dr. M. J. Wilson, President; Hiram Rosekrans, Vice-President; Thomas Devine, Treasurer; A. F. Benjamin, Secretary; C. H. B. Smalley, Superintendent.

SUTRO. S. M. Co.—President, Solomon Heydenfeldt; Directors, W. W. Grayson, E. M. Hall, Geo. J. Ives and Wm. E. Miller.

HECKERDORN. G. & S. M. Co.—Trustees: F. Smith, Sarret Matbew, L. Chapeau, C. Guelmin, J. Verdier. F. Smith was elected President, and Paul J. Roberts, Secretary.

The following companies have filed certificates of incorporation in the County Clerk's office, San Fran-

CHERRY CREEK CONS. M. Co.—Dec. 31. Location, State of Nevada. Trustees: Geo. W. Beaver, B. F. Sherwood, John Turner, J. D. Fry, John A. Paxton. Capital stock, \$3,000,000, in shares of \$100 each.

DAYTON N. M. Co.—Dec. 31. Location, Devil's Gate Mining District. Directors: D. L. McDonald, L. Aldrich, Chas. B. Higgins, C. O. Leavitt, and Robert Sherwood. Capital stock, \$300,000,000, in shares of \$100 each.

SILVER CITY M. Co.—Location, State of Nevada. Directors: Edward Banoñ, George Congdon, George J. Dodge; Seth Cook and A. Borland. Capital stack, 6,310,000.

SULPHURETS M. Co.—Location, Storey County, Nev. Directors: Martin White, W. S. Hohart, Wm. Kohl, A. K. P. Harrison and W. E. Dean. Capital Stack, \$5,000,000.

GUANADA G. & S. M. Co.—Location, Storey County, Nevada. Directors: Louis Sloss, A. K. P. Harmon, Seth Cook, R. W. Graves and Joseph Clark. Capital stock, \$5,000,000.

CALIFORNIA TOBACCO CO.—Jan. 5. The object is stated to be the raising, cultivating, curing and manufacturing of all kinds of tobacco, and otherwise buy and sell

and deal in tobacco. Directors: Joseph Bandenstein, Emanuel Wertbeimer, Wm. H. Sharp, John A. Drinkhouse and Henry Sutliff. Capital stock, \$100,000, in shares of \$100 each.

SOUTH STAR G. & S. M. Co.—Jan. 6. Location, Devil's Gate and Spring Valley M. District, Lynn County, Nev. Directors: Charles J. Collins, James Pritchard, H. G. Cuward, Joseph F. Atwill and W. H. Smith. Capital stock, \$4,800,000.

ORLEANS G. & S. M. Co.—Jan. 7. Location, Storey County, Nevada. Trustees: A. K. P. Harmon, W. B. Thornburgh, John Skea, Joseph Clark and W. V. Dean. Capital stock, \$2,800,000. In shares of \$100 each.

MEMNON M. Co.—Jan. 7. Location, Devill's Gate
Lyon Co., Nev. Directors: Isaac L. Regna, A. M. Ed-
ington, A. K. P. Harmon, J. D. Fry and W. E. V. Dion.
Capital stock \$7,300,000, in shares of \$100.

INCREASE OF CAPITAL STOCK.—The Scorpion S. M. Co. has increased its capital stock from \$400,000 to \$4,000,000. The certificate states that the debts of the company amount to about the sum of \$500, the payment of which is secured by the property of the company.

MINING SUMMARY.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California

AMADOR COUNTY

KENNEDY. — *Ledger*, Dec. 27: On Monday morning last we visited the Kennedy mine and made an exploration of its underground workings. We descended and commenced our explorations following the lower level south from the new shaft about 200 feet. From the new shaft running south the ledge has increased immensely in width, the workmen are now driving south in the lower level a breast of twenty feet or compact ore and have not reached the hanging wall; the entire width of the ledge south has not yet been ascertained. The whole mass of rock looks remarkably well, and as the mill has been running for some time past on rock from this level, its true value has been fully ascertained, this vast mass of rock has so far yielded \$12 per ton. From the lower level we ascended to the first above it where the ledge has increased in a corresponding ratio with the lower one in running south, and showing precisely the same character of rock; from the second lowest level we ascended to others above and examined each as far as they have been driven south, and in every instance the increase in the size of the ledge is the same as the work progresses south. From the new works we followed the levels north until we entered the old

lowed the levels north until we entered the old drifts of the Kennedy, and had an opportunity to study the general characteristics of the mine. The old shaft and work connectives therewith are upon a chimney separate and distinct from the chimney now being worked south of the new shaft; in going from the old shaft south, the ledge worked from the last named shaft, dwindles down to scarcely a foot in thickness and in some of the levels wholly disappears, but in driving south the new chimney was struck, presenting a mass of pay ore seldom if ever before found of the same quantity and

value, in any mine in the State. The new shaft and the works connected with it, has developed the fact that two separate and distinct

chimneys are embraced within the Kennedy claims, the extent of neither of which has not yet been proven. It is very rare to our mines that heavy formations, such as the one now presented in the Kennedy, bear much gold, but the entire rock now being taken from the south level to the full extent of 20 feet in width, is all good milling ore, much of it well charged with gold bearing sulphurets, and nearly the whole of it ribbon rock, peculiar to the great mother lode. The twenty stamp mill belonging to the mine, is wholly inadequate to crush the

rock taken only by a few men; if the crushing power was 60 or even a 100 stamps, rock could

readily he furnished to
played and if 60 were

ty, the monthly yield of the Kennedy would be equal if not surpass any mine in the country. The conveniences about the mill and shaft are surpassed by no mill or mine in the State, nor can rock from any mine be sent to the surface, and from thence to the stamps cheaper or more expeditiously than at the Kennedy. The new shaft is a model in every respect, and the levels are most securely timbered in true workman-like manner, reflecting credit upon the mining knowledge and skill of Mr. Barryman, under-

BUTTE COUNTY.
ANOTHER BIG BRICK.—*Record*, Jan. 3: Another fine gold brick came down from Cherokee on Monday, valued at about \$40,000. They have cleaned up only a portion of the head mine the present month. The Spring Valley Company is running six or eight hydraulic chieft or little giants, and on some general clean up

will scarcely fail to produce a larger golden brick than ever.

CALAVARAS COUNTY.

NEW QUARTZ DISCOVERY.—*Chronicle*, Jan. 3: A quartz ledge of unprecedented richness has lately been discovered in Wet Gulch, Whiskey Slide district, by some Italians. But little work has been done upon it yet, but it is proving rich beyond all comparison. The ledge is not to exceed six inches in thickness, but it is nearly half gold. A piece of quartz about as large as your two fists, pounded in a mortar, yielded seventeen ounces of gold! We never heard the like before.

WOLFEANE.—The sinking of the shaft in Wolfeane mine, near Railroad, to the depth of 400 feet, is completed, and the running of levels commenced. Sinking will be resumed as soon as the levels are run far enough not to interfere with the work. We learn that the ledge is looking first rate.

MOSCITO.—*Cur. Chronicle*: Garland & Co. are now crushing rock from the Good Hope, in their 10-stamp battery, which, by a recent clean-up, proved rich enough to give the proprietors a large surplus above expenses. The 8-stamp battery is crushing rock from the Monte Cristo mine, which, judging from the countenance of the superintendent, Mr. J. Albright, promises to pay a handsome profit to the owners.

HAWKUS & CO.'S TUNNEL has just reached the body of pay ore in their mine, which will soon produce a chunk of metal from which these beautiful birds called eagles, are made.

EL DORADO COUNTY.

HYDRAULIC.—*Republican*, Jan. 1: Hydraulicking through a six inch nozzle, with an eight or nine hundred inch head, has been in progress at the Excelsior mine, Coon Hollow, during the past two weeks, and is doing splendid work. Another stream of the same size will soon be added, when things will fairly howl at the Excelsior.

NAPA COUNTY.

QUICKSILVER.—*Register*, Dec. 27: "Cinnabar" seems now to be on the end of every man's tongue, and a man who hasn't his pockets full of specimens is hard to be found. During the last few days some very rich discoveries have been made in the mountains west of this place. J. M. Davis & Co., have just brought in some of the best looking ore I ever saw, and they say there is plenty more of it in sight. New claims are being located every day. It seems that Nature has intended this to be one of the richest mining and agricultural districts in the State. The ledges are shallow, easily worked, and in a country where water and timber are plenty, bordering on a valley of productive land, and only ten to twenty miles from railroad communication.

NEVADA COUNTY.

GRAVEL.—*Union*, Jan. 4: The gravel mines in the upper part of this country are not running very heavily just now, because there is too much snow and ice to allow the water to go severely at the gravel banks.

RAINFALL.—The rainfall from December 31st, at 4 o'clock P. M., up to the same hour January 1st, was 2.12 inches; and from 4 o'clock P. M., of the 1st, up to the same hour on the 2d, the rainfall was 1.58 inches—making a total of 3.70 inches for the 48 hours, the ground gets itself frozen these nights, the sky is cloudless and the barometer ascends.

SIERRA COUNTY.

WASHINGTON.—*Downville Messenger*, Jan. 3: The Bald Mountain Company have had plenty of water for several days, and are rapidly running off their dirt.

GOLD BLUFF.—The Gold Bluff mill has been idle for a short time. The owners are running a short head rock tunnel, which interferes with getting out rock for the mill. The mill will be started in a short time.

TUOLUMNE COUNTY.

ANOTHER BIG STRIKE.—*Independent*, Jan. 3: The quartz claim of Reed & Ferrier above Columbia, bids fair to prove one of the richest mines in the county. A short time since they struck another rich spot, and the week before Christmas as we are informed, they came upon still another deposit richer than ever. One piece taken out weighed upwards of 95 ounces—all gold—and a panfull besides. This much is known, but how much more they got is only guessed at, as they keep their own counsel about it.

MOUNT JEFFERSON MINE.—*Democrat*, Jan. 3: For quite a time work on this mine which is situated at Garrote has been almost if not quite suspended; when working at a depth of 270 feet, Superintendent Frank Shattuck found very good rock in the west drift, but the water drove him out, and as the company, concluded not to go to the expense for new pumps and necessary apparatus, the mine was practically abandoned at that depth. Shattuck recently commenced sinking a new shaft about 300 feet west of the old works and is now at a depth of 25 feet from the surface. He has found good milling rock; at a depth of twenty feet the ore promises to pay from \$80 to \$100. The vein is from 7 to 10 feet wide and as followed down appears well defined and regular. The Superintendent feels confident he is on the same stratum that proved so good at the depth of 270 feet when the water drove him out. For several years this mine yielded richly and served to build up and keep up Garrote, giving employment to a large number of working men. It is hoped that the vein is still rich, which, with capital and patience, will prove profitable again to owners and the people in its vicinity. The prospect is good for this almost abandoned

mine attracting the attention of those who may have done the same thing—laid by a rich lead.

Nevada.

ELY DISTRICT.

WASHINGTON AND ORKLE.—*Record*, Dec. 28: Since the 5th, \$18,000 worth of bullion has been shipped, and by the 5th of next month expect to send off \$20,000 more. Up to yesterday 200 tons of ore have been shipped to the Amador mill, average pulp assay over \$200 per ton. The Washington & Creole Company will next week let a contract to sink the Mazzeppa 100 feet further.

MEADOW VALLEY.—No. 3 shaft is now 104 ft. below the tenth station. The drift from the tenth station running west, is in 62 ft. The east drift on the ninth level is in a distance of about 400 ft., and is being rapidly pushed ahead. The east winze from the eighth level is down 76 ft. The east drift on the 520-ft. level is in 344 ft. The summit shaft is down 892 ft. A cross-cut is being run to connect with the west drift of the eighth station, No. 7 shaft.

BOWEN.—Commenced drifting from the bottom of the shaft on Friday, with three shifts of men. The ground is very hard at present, and indications are favorable. The main shaft is 500 ft. deep.

PORTLAND.—Drifting commenced on Friday in the bottom of the main shaft. Three shifts of men are at work. The indications generally are good, and the ground very hard. The Portland shaft is 400 ft. deep.

NEWARK.—Drifting from the third and fourth levels. Commenced raising ore yesterday, and will continue raising ore hereafter. The ore is looking well. Working 30 men.

PAOK AND PANAOA.—Sinking on the ore and running the drift ahead for the main ledge. Working a strong force of men.

SILVER PEAK.—Sinking on the incline continues with the usual force of men. The indications are flattering.

PICOCHE WEST.—Work was resumed last Monday, and we have every reason to expect, from what we learn, that this mine will be more than self-sustaining in a short time.

PICOCHE.—The new works continue to move satisfactorily. Sinking progresses.

CONDOR.—Still drifting towards the ledge.

PEAVINE.—Expect to make connection with the new shaft in a few days.

INOMAN.—Prospecting the drift from the 580-ft. station. The drift is in 420 ft. and still progressing. Two shifts working.

HAVANA.—Work progressing as usual. Mine still looking well.

CAROLINE.—Shaft down 650 ft., and the drift is near the ledge. Seams in the country rock assaying encouragingly.

HUGH AND HUNT.—The south drift is being pushed vigorously ahead.

SPRING MOUNT.—No work is being done owing to the snow, which prevents the using of the whim.

AMERICAN FLAG.—Sinking rapidly. The American Flag mill is kept running on ore from this mine.

LOUISE.—No change in this mine worthy of special notice at this time.

CHIEF EAST.—Drift from the bottom of the shaft is in quartz, all carrying ore.

ALPS.—Drifting in the 547-ft. level. Still drifting.

WASHOE DISTRICT.

CROWN POINT.—*Gold Hill News*, Jan. 3: Daily yield, 400 tons, which is being extracted from the 10, 12 and 1,300-ft. levels. All the ore breasts are looking well. The south drift, on the 1,400-ft. level, which is being run to meet the Belcher, as well as with the south winze from the 1,300-ft. level of the Crown Point, is being pushed ahead vigorously. Some time since a cross-cut or drift was started on the 1,400-ft. level at a distance of about 350 ft. from the Belcher line. After passing through the west clay wall, which is 3 ft. thick, some very rich ore was encountered. As the drift was pushed forward it passed through some 12 or 15 ft. of almost barren quartz, when some ore assaying from \$50 to \$75 per ton was met with, which continued of the same quality for 24 ft., when was struck what was believed to be the east wall, but which proved to be only a horse of porphyry 6 ft. in thickness. After getting through the porphyry, ore was encountered, the assays averaging from \$250 to \$600 per ton. The ore continued of the same quality for a distance of 16 ft. The flow of water from the main drift on the 1,500-ft. level, continues without intermission—being all that the pumps can handle.

SCORPION.—This mine is situated about 2,000 ft. northeast of the Ophir shaft, on the same hill leading down to the mouth of Six-mile Cañon. It is one of the oldest locations on the Comstock lode, and has one of the largest outcrops of quartz of low grade ore in the district. Its croppings extend to within 300 ft. of the Ophir shaft. The company have a United States Patent, and have a tunnel of 600 ft., well timbered, and which cuts the ledge at a depth of 300 ft., finding ore that will mill from \$8 to \$14 per ton. The ore body is 20 ft. in width and yields mostly free gold. The company intend sinking a shaft of three compartments, 4x5 ft. in size. They will also prospect and extract ore from what is known as the Brown ledge for milling at the same time. The new shaft will be sunk directly on a line with the Ophir shaft.

BELCHER.—Daily yield, 500 tons. Recommended the work of sinking the main incline, preparatory to opening out the 1,400-ft. station. The drift on the 1,300-ft. level running north is in 287 ft. The drift running south from the

Crown Point line to meet it is in 559 ft. A new winze has been started to connect the 1,300 and 1,400-ft. levels. It is down 30 ft. The mine is looking well throughout, and is yielding the usual amount of excellent ore.

OPHIR.—The streaks of rich ore recently found in the cross-cut from the main south drift on the 1,300-ft. level, still continue to widen out and consolidate as the work progresses to the southward. The main south drift on the 1,465-ft. level still continues in rich ore.

SENATOR.—Sinking the shaft has made good progress during the week, fentling leaders of quartz in the bottom of the shaft that give assays as high as \$700 per ton, mostly silver. Opening a station to drift for the main ledge at the 400-ft. level will be commenced on Monday next.

TYLER.—The main west drift at the 200-ft. station during the week cut into a fine body of quartz that assays well, tapping a considerable flow of water, although not sufficient to impede the progress of the work.

MINT.—Sinking the main shaft for a new level is making rapid progress, the rock in the bottom blasting well and showing occasional stringers and feeders of quartz of a very promising character.

KOSKUTH.—The main west drift at the 200-ft. level has cut some fine streaks of quartz and ore during the week, giving promise of a good ore development when the main ledge is reached.

DANXY.—Nothing new except the rapid and steady progress of the main shaft. No water to interfere with the progress of the work.

JUSTICE.—Opening the station and getting ready to sink a main incline for a new level is making steady progress.

KNICKERBOCKER.—Setting up the new machinery is making steady progress, and it is expected that the whole will be ready to start-up in about three weeks.

BALTIMORE CONSOLIDATED.—Sinking the main shaft for a new level is making rapid progress.

YELLOW JACKET.—Sinking the main incline is making rapid progress. Drifting and prospecting the 1,500-ft. level is still being vigorously prosecuted.

DARDANELLES.—The interesting developments in the Overman mine, give additional value to this, the adjoining mine, and a consequence raise in the stock.

SAVAOE.—Opening the 1,900-ft. station is making good progress.

SUTRO.—Both north and south drifts are being pushed ahead vigorously with favorable indications in the faces of each drift.

OCCIDENTAL.—Some fine ore has been encountered during the week in the winze from the main tunnel, giving promise of a good ore development.

ALAMO.—Preparations to resume sinking the shaft, and commence the extraction of ore are making rapid progress.

SIERRA NEVADA.—Daily yield of ore 60 tons. The temporary hoisting machinery for the new shaft is in position, and will be ready to start up in a few days. Sinking the new shaft is making good progress.

OVERMAN.—Steady progress in the main west drift on the 1,200-foot level. A Burleigh drill and air compressor has been sent for, East, and will arrive in a very short time, when it is expected that short work will be made with the remainder of the distance that the tunnel on the 1,200 level will have to be run to tap the ledge. The foundation for the air compressor is already being laid, so that there can be no delay when it arrives.

LANX WASHINGTON.—The new hoisting works building and machinery of this company, which have just been completed and started up are of the most durable and complete description, and of sufficient capacity to work the mine to the depth of 1,000 ft. with perfect ease. The cost of the improvements will amount to \$80,000. The shaft is down 150 ft., and will be continued to the depth of 250 ft., when it is the intention to open a station and drift for the ledge. This company being situated just south of the New York Cons. expect to strike the gold cañon branch of the Comstock, tending to the south-east through the Belcher, Overman and New York Cons. toward the Justice, and are commencing work under the most favorable auspices.

CONSOLIDATED VIRGINIA.—Daily yield of ore, 250 tons. The ore breasts, both north and south on the 1,200-ft. level are both looking well and yielding finely. The north winze on the 1,200 ft. level, is down 152 ft. the entire distance in good ore, the bottom being even richer than at the commencement. It is hourly expected that the connection will be made between the up-rise from the 1,200 ft. level and the main east drift on the 1,000 ft. level, which will give a good ventilation and greatly facilitate work throughout the mine. The main drift on the 1,300 ft. level, is being rapidly driven ahead to tap and prospect the ledge. The mills are kept steadily running and the future prospects of the mine grow more flattering every day.

JACON LITTLE.—A fine body of good pay ore has during the week been cut into and developed by the west drift from the shaft. It is about 20 ft. wide, and said to be better ore than any heretofore found in that mine. It assays very high in gold, being in the proportion of two-thirds gold to one of silver. Experts pronounce this the west ledge of the Comstock, as the ground lies on Cedar hill, between the Sierra Nevada and the Ophir, and to the westward of both. The company have over 200 tons of ore already out on their dumps for milling when the proper facilities offer.

DATTON.—The ore breasts and stopes on both

the second and third levels are looking well, and yielding finely. The winze from the first to connect with the second station is finished, giving a fine circulation of pure air in that part of the mine, and opening the way for the extraction of the fine body of ore developed between the first and second stations. The Woodworth mill, which was again started up on ore from the mine, last Saturday, has been kept steadily running, and we may soon expect to hear of good returns.

INDEPENDENT AND OMEGA.—This mine is situated north of the Ophir. It was located in 1859 and contains 2,400 ft. on the Comstock lode. A tunnel 350 ft. in length has been run, entering the ledge at a depth of 100 ft., which between the clay walls was 80 ft. in width and showed some veins of very fine black ore, although not in sufficient bodies to pay to extract at that time. The tunnel is still in good working condition, and it is the intention of the company to resume work by drifting along the line of the ledge in a southerly course. It is the intention also to commence sinking a large working shaft 500 ft. east of the ledge, on a line with the shaft of the Utah.

UTAH.—Still driving the main west drift at the 400 ft. station; a steady increase in the flow of water.

JULIA.—The ore prospects in the main south-west drift on the 900 ft. level continue to show improvement daily. The main southwest drift on the 1,000 ft. level has been repaired, and work resumed in the face.

ARIZONA, UTAH AND GLOBE.—The indications of finding a permanent ore body in the south drift from the bottom of the incline show a steady improvement.

ROCK ISLAND.—This claim, which has been worked through a tunnel, shows a large ledge, from 75 to 85 ft. in width, and increased in heavy clay walls. While the ore at present is of low grade, it presents prospects very favorable to the development of a good mine. They are now drifting north and south from the main tunnel, and will begin crosscutting the ledge very soon. The working force in the mine is to be immediately increased.

SEABOARD CALLEDONIA.—This mine is situated between the Calledonia and Knickerbocker shaft, the title being derived from the North American Co. the Seg. Calledonia comprising 100 ft. of ground adjoining the Calledonia on the south. Two shafts have been sunk on the claim, one 80 and the other 150 ft. in depth. The last is almost the entire distance through low grade ore of the same character as that found in the Calledonia. Preparations are being rapidly made for the extraction and milling of ore. Prospecting the ledge to a greater depth will be pushed with all the vigor possible.

SILVER HILL.—Sinking the main shaft is making good progress, the rock in the bottom blasting finely. Both the north and south drifts at the second station show a decided improvement in the quality of the ore penetrated during the week.

NEVADA.—A fine body of ore has been encountered during the week in the south drift, 140 ft. from its junction with the main west tunnel. The body of ore is gradually widening, and promises a development of great value. There is also an improvement in the ore found in the up-rise from the main tunnel.

GOULD & CURRY.—The east drift on the 1,700 ft. level is hourly expected to strike the ledge, and there seems but little doubt when it is accomplished that rich ore developments will follow.

NEW YORK CONSOLIDATED.—The appearance of the mixture of clay and quartz at the bottom of the shaft has shown but little change during the week. The sinking is making steady progress, the bottom of the shaft still in clay and quartz. There is a slight increase of water.

CHOLLAS-POTOSI.—Daily yield, 95 tons of ore, the assay value of which is \$30 per ton.

BROCKEY.—The ore in the face of the north drift in the old shaft, 560 ft. north of the incline, has shown some improvement during the week. Preparations are being made to sink the main incline 100 ft. deeper for a new level. The Hope mill has shut down for a short time.

HALE & NOACROSS.—Sinking the main incline making good progress. Opening the 1,900 ft. station is making good headway. Sinking the north winze, from the 1,700 ft. level, to connect with the main north drift on the 1,900 ft. level, is also making steady progress, showing during the week some excellent indications of good ore.

CALLEDONIA.—Repairing the main shaft between the 500 and 600 ft. levels is completed, so the cages can now descend to the 600 ft. station. This station is being rapidly put in order for future working operations. The hoisting machinery is all in fine working condition, and everything in and about the mine shaping for a good, solid winter's work. The drain tunnel is being driven ahead at the rapid rate of 7 ft. per day.

PICTOR.—Operations have been somewhat impeded the last day or two by a heavy slide of earth at the mouth of the tunnel, blocking up the mouth and flooding the car track with water. The obstruction, however is nearly removed, and next week work will be resumed at the face of the tunnel. Superintendent Turney reports indications favorable.

IMPERIAL.—The new spur wheel is in place, and it is expected that every thing will be in readiness to again start up the hoisting machinery by Monday next. There has been no work done either in the shaft or on the lower levels during the week. The station for the 1,900 ft. level is opened, and a main drift will be started for the ledge during the coming week.

The Chilian Method of Amalgamation.

Mr. Frederick Prime, Professor of Metallurgy in Lafayette College, Easton, Pennsylvania, has furnished from a French source the following account of this process to the *American Chemist*:

The first process employed in Chili was that of the ordinary *patio*, but this was soon supplanted by another method which formed the basis of that now in use. This consisted of treating rich sulphurets in copper vessels with cupric sulphate, sodium chloride, and mercury. At the end of a little time almost the whole of the silver was amalgamated; being, however, only accomplished at the expense of a large amount of mercury, the loss frequently being 200 to 250 per 100 of silver; in spite of which this process was frequently employed for the treatment of ores containing more than 0.02 per cent. silver, owing both to the rapidity of the operation, it taking less than two hours when aided by heat, as also to the small percentage of metal (scarcely 0.0002 to 0.0003 per cent.) left in the tailings. The enormous amounts of argentic chloride, iodide, and chloro-bromide produced at Chanarillo soon demanded a more rapid, though less exact, process than the older one. In order to obtain some idea of the amount of ore requiring treatment, it will suffice to mention that the single mine of Deschuidora produced in the years 1831-51, the sum of ninety three millions of dollars.

In the new process applied to these ores, they were crushed and pulverised as in the old method. The pulverised ore was carried by a stream of water to settling basins of sheet iron, 6½ feet in diameter, and 9½ feet deep. The stream was conducted in turn to different basins, which, when once filled, are left to stand from eight to ten hours to permit the slimes suspended in the water to settle at the bottom. At the end of this period the clarified water was decanted off and the slimes were transferred to *tinias*. These *tinias* consist of wooden vats, having a cast iron bottom, and are 5 feet 10 inches by 3 feet 11 inches. These are provided in the line of their axes with a shaft having cast iron arms which slide over the bottom of the vat. The charge placed in these *tinias* was about a ton and a half. The ores are a mixture of chlorides, iodides and bromides, having a gangue composed of the carbonates of lime and baryta as well as clay and oxide of iron. The charge of the vat was completed by the addition of mercury, about twenty times as much of this being added as there is silver in the ore. The shaft was then set in rotation, making about four revolutions per minute. This operation lasted twenty-four hours, at the end of which the amalgamation was supposed to be completed. A stream of water was then introduced, and the rotation continued. The slimes were removed by the water, and carried into settling basins. When the water ran clear from the vats an orifice was opened in the lower portion of the vat, and the mercury and amalgam which ran out were received in a cast iron vessel, called *cocha*. The amalgam was then squeezed in a thick piece of cotton, and then laid aside for distillation.

The wages, loss of mercury, and various expenses cost \$9 30 per ton for ores containing less than 0.005 per cent. silver. The entire operation, including crushing, took about sixteen hours. The tailings carried off by the current of water, which were caught in settling basins, contained 0.0008 to 0.001 per cent. silver, in the case of ores of the above mentioned richness, and never exceeded 0.002 for richer ores of the same character. The silver obtained contained scarcely 0.01 per cent. of impurities.

The process just described subsequently underwent several modifications. The time occupied in treating the ore in the vats, exclusive of lixiviation, was reduced to six hours; and ores were treated in this manner containing as high as 30 per cent. silver.

Owing to the increase in the proportion of sulphurets as the mines were sunk deeper, the results of the method of amalgamation just described underwent modifications; the percentage of metal in the tailings being augmented to such a degree as to diminish the yield of silver.

The tailings, which were thrown to one side at the time of amalgamation, formed near the works enormous masses of poor ores, whose contents increased daily; the more so, as to these were added such ores as were thrown aside when picking over the ores.

Attempts were made to recover the silver contained in these large bodies of tailings, for which purpose various experiments were tried. The first one tried was the Freiberg process of roasting and chlorination; the results obtained were very unsatisfactory, owing to the inexperience of the workmen. Experiments were then made by chlorination and subsequent treatment with ammonia, which were still more unsuccessful, owing to the high price of ammonia. The argentic sulphate process (Zier-vogel's) did not yield any more satisfactory results.

Recourse was then had to the process which we have first described, and which had been so long abandoned. As we have stated, rich ores called *negrilla*, which were sulphurets, were treated in copper kettles together with cupric sulphate, sodium chloride and mercury. The reactions took place were the following:

The cupric sulphate was transformed into protochloride in the presence of sodium chloride, thus: $\text{CuSO}_4 + 2\text{NaCl} = \text{CuCl}_2 + \text{Na}_2\text{SO}_4$. The heated cupric protochloride coming in con-

tact with the copper of the kettle formed subchloride— $\text{Cu}_2\text{Cl} + \text{Cu} = \text{Cu}_2\text{Cl}_2$. The cupric subchloride, in the presence of argentic sulphide and mercury, reacted on the sulphide, the affinity of the mercury for silver promoting the reaction— $\text{Ag}_2\text{S} + \text{Cu}_2\text{Cl}_2 + \text{mHg} = 2\text{AgHg} + \text{CuCl}_2 + \text{CuS} + (\text{n}-2)\text{Hg}$. In this manner the amalgam was formed.

As we have seen, this process, as formerly carried on, occasioned the loss of a large amount of mercury. The reaction by which the cupric protochloride was converted into subchloride was at that period at the expense of the copper kettles and the mercury. Thus a great loss of mercury was occasioned, and the copper vessels were rapidly destroyed. When, therefore, a return was made to this process, the first thing sought for was the production of the subchloride in special vessels and by other means.

Recourse was had to the following method:—The sodium chloride is dissolved in water; 5 parts of salt per 100 of ore. Cupric sulphate is also dissolved in water until a Banné's aerometer indicates 20°. Sodium chloride is added to saturation. By this means the cupric sulphate is converted to protochloride. The protochloride is then transferred to a wooden vat, into which metallic copper is charged at the same time. The liquors in the vat are then made to boil by introducing steam at a pressure of three atmospheres. At a temperature of 100° C. the cupric chloride reacts on the metallic copper, and thus forms the subchloride which is subsequently employed in the amalgamation. The reaction is known to be finished when, on taking 50 c. c. of the solution, and introducing it into a liter of water, the oxychloride precipitates as a white powder, leaving the liquid entirely colorless. The subchloride is used as soon as made, and care must be taken to preserve it from contact with the air so as to avoid the formation of insoluble oxychloride. To prevent this oxidation the solution is slightly acidulated with sulphuric acid. We will now proceed to the treatment proper of the ores.

The ores are first crushed. For this purpose an apparatus called *trapiche* is employed, resembling the mill employed in the manufacture of oil. Two vertical cast-iron wheels, each weighing about four tons, form the chief portion of the machine; each of these has a rim of wrought iron or steel. These wheels are mounted on arms set in motion by a motor of some kind. They are given a velocity of ten to twelve revolutions per minute and rotate on a disk, called *solera*, made either of cast iron or steel, and on which the ore to be pulverised is spread. The ore is thus crushed to a fine powder. While the wheels are rotating a current of water is made to flow continuously, which carries off the ore as it is crushed. The quantity of water depends on the fineness to which the ore is to be crushed. The current of water is then made to flow through a succession of tanks, in which it deposits the ore it has carried off. The water escapes perfectly clear from the last reservoir. When the first tank is completely filled with ore, the current water is cut off, and the slimes allowed to precipitate for eight hours. The clarified water is decanted and the slimes, forming a thick paste, are shovelled out on to a level floor, where they are left until they are completely dried by the air. The capacity of each tank is about 16½ feet by 6½ feet at the base, and is 3 feet 4 inches high.

In the amalgamation proper the ore, properly dried, is charged into casks whose capacity varies from one to four tons; those of four tons capacity being preferred at present, whose dimensions are 5 feet 10 inches by 4 feet 10½ inches; the thickness of the staves is about 3 inches. The arrangement of the casks is almost identical with that formerly employed at Freiberg.

A charge is composed of four tons of ore with a sufficient amount of *saumure* to form a thick paste. A varying quantity of *magistral* is added, depending on the richness of the ore and the nature of the gangue. When the latter is calcareous, more *magistral* is used than when it is argillaceous, or ferruginous, since the calcareous gangue decomposes a portion of the cupric subchloride. For an ore containing less than 0.002 per cent. silver having a mixed gangue, from 28 to 38 liters of *magistral* is used. The casks are made to rotate for twenty to thirty minutes, in order to give the paste time to form; then the mercury is introduced, being about twenty to twenty-five times the amount of the silver in the ore. The rotation of the casks is then continued at the rate of four or five revolutions per minute. Six hours suffice to complete the operation.

If the ores subjected to this treatment contain a large proportion of argentic chloride or bromide, 25 lbs. of lead are added to the mercury for every 100 lbs. of silver. This lead is added as amalgam; it serves to prevent the chlorination of the mercury. The reaction of the argentic chlorides is: $2\text{AgCl} + \text{Cu}_2\text{Cl}_2 + \text{mHg} = 2\text{CuCl}_2 + 2\text{AgHg} + (\text{n}-2)\text{Hg}$. The lead chlorides more readily than the mercury; the chlorine and bromine set at liberty by the decomposition of the argentic chlorides and bromides reacting on the metal; thus avoiding, in the first place, the loss of mercury which would result from the chemical combination; and, secondly, another loss, much more considerable and purely mechanical, due to the division of the mercury into little droplets by the mercuric chloride, which, when once formed, envelops them in a thin pellicle which destroys the homogeneity of the metal, and prevents it from remitting. The mercury is thus reduced to a powder, occasioning great loss. The use of lead reduces this loss from 150 to 25 parts per 100.

When the amalgamation is completed, the next step is to wash the amalgam, which operation is performed the same as in the Freiberg process.

After which follows the refining of the amalgam, which contains cupric oxide and sulphide. The first of these is formed by the reaction of the lime of the gangue on the protochloride, the last by the reaction of the *magistral* on the argentic sulphide. The refining is divided into two parts, the mechanical and the chemical. The former is performed in a *tina* analogous to that already described, the process being to charge the amalgam into the vat, adding ten parts of mercury to 100 of the former. A current of water is then introduced, and the shaft is made to rotate at the rate of sixty revolutions per minute. In this manner the whole of the cupric sulphide and a very small quantity of the oxide are removed. This operation is finished when the water escapes perfectly clear.

To proceed to the chemical refining, the water in the vat is permitted to escape, and two parts of ammonium carbonate per 100 amalgam are added. The shaft is caused to rotate from four to five hours, and the amalgam is then washed, when it is found to be entirely freed from cupric oxide.

The distillation of the amalgam takes place in a closed vessel *per descensu*. The furnace is formed by a cast iron hell, the lower portion of which stands in a basin of water in which the mercury condenses. The upper portion of the bell is surrounded by a circular wall; the fuel being charged into the annular space between the wall and the bell, which is about 3 to 5 inches.

The spongy silver (*pina*) which is obtained is remelted in a reverberatory. It is necessary to thoroughly rub the metallic bath; the remnant of arsenic remaining is thus removed by contact with the iron tools, forming an iron arsenide which floats on the surface and is easily removed. The silver thus obtained is 980 thousandths fine.

The process which has just been described is applicable to all silver ores, with the exception of argentiferous copper pyrites, galena, blende, and such ores as contain more than 1 per cent. of free arsenic, the latter largely augmenting the loss of mercury.

In this manner it is possible to treat tailings not containing more than 0.0004 per cent., and ores not containing over 0.0006 per cent. silver. So long as the richness of the ores subjected to this treatment does not exceed 0.005 per cent., the tailings obtained do not contain more than 0.00015 to 0.0002 per cent. silver.

The ores subjected to treatment are never reduced to an equal percentage by mixing, as it is found much more profitable to treat the rich ores separately. In this case the operation is completed much more rapidly, the interest on the capital thus running for a much shorter period, thus compensating, to a great extent, for the cost of treating the refuse of the operation.

The mercury which has been used five or six times becomes so charged with impurities as to retard the amalgamation. It is purified by adding 20 grammes of sodium amalgam to every 200 lbs. of mercury.

The works are usually placed near a stream of water, in order to have both the water and motive power necessary for the various operations.

Works of sufficient capacity to treat eight tons per day consist of—1. An area of 550 yards for dumping ores. 2. Two *trapiches* set in motion by a motor of six horse-power. 3. Four basins. 4. An area of 1,100 yards for drying the pulverized ores. 5. Two amalgamating casks, with a motor of eight horse-power. 6. A vat to receive the wash-water of the casks and to recover the comminuted mercury. 7. A vat for washing the amalgam. 8. A distilling furnace. 9. A melting furnace. 10. A wooden vat for the preparation of the *magistral* with a small caldron. 11. Two vats in which to dissolve the sulphate. 12. A basin constructed of hydraulic cement for the *saumure*. 13. A caldron in which to treat the *saumure*. To which must be added the basins for clarifying and purifying the waters.

These last are made to pass through quicklime in order to recover the copper salts. They are thus rendered limpid and potable. The persons employed consist of a superintendent, an assistant superintendent, an assayer, a clerk, a foreman, and ten workmen.

The cost per ton of ore, containing 0.002 per cent. silver, is—pulverizing, 1.49 dol.; mercury, *magistral saumure*, 3.72 dol.; refining the amalgam, .04 dol.; distillation, .04 dol.; melting and refining, .09 dol.; tools and various expenses, .93 dol. to 1 dol. 0.03c. [These values are given in coin.]

This does not include interest, the operation taking each a short time, nor a sinking-fund of the capital.

The great charm of the Chilian method of amalgamation is its great simplicity. This process eliminates a large number of the operations preceding the amalgamation, or considerably simplifies them. If, for example, it be compared with the European method of amalgamation as formerly carried on at Freiberg, it will be found to be infinitely superior both for rapidity and simplicity. It entirely does away with the difficult operation of roasting, which is delicate in its manipulation and the cause of almost all the loss of silver. Even when compared with the American method of amalgamation as carried on in Mexico, it is infinitely superior as regards rapidity. It replaces the doubtful and hypothetical reactions of this process by chemical reactions which are both exact and clearly defined. In one word,

it solves in the most simple manner a question in silver metallurgy which has never been hitherto accomplished but by roundabout means, i. e., the elimination of the sulphur and the direct union of the silver and mercury.

Finally it may be stated that, while elsewhere amalgamation must give way to the fusion with lead as soon as this becomes possible, as applied with us it will not be the case, since it greatly surpasses this process. It is unknown who was the inventor of this method; it can only be stated that this process has been constantly in use at Copiapo since 1862.

Divisibility of Quicksilver, Gold and Silver.

The *Virginia Enterprise* says: "The divisibility of quicksilver, and also of silver and gold, as shown by the mining operations conducted in this State, is almost incomprehensibly great, and would seem to be almost illimitable, particularly in the case of the metal first named. A globule of quicksilver may be divided until no longer visible to the naked eye, and indeed scarcely visible under a powerful microscope, yet even the most minute subdivisions shall be found to contain silver or gold, perhaps both. How infinitesimally small, then, must be the particles of silver or gold contained in one of these invisible and immeasurable globules of mercury! In regard to the astonishing divisibility of the metal mentioned, we have just learned some interesting facts of Dr. Buncher, Superintendent of the Rock Point Mill, Dayton. This gentleman informs us, that some time since, when working in his mill for a considerable period, an ore in which gold largely predominated, he used every precaution to guard against loss. In addition to the usual settling tanks, he caused to be dug in the ground a number of large pits, into which the waste water flowed after leaving the tanks. After leaving these pits, the water passed off in a small flume, and to the eye appeared as clear as the water of the purest mountain stream. For the sake of experiment, Mr. Buncher coated a copper bowl with quicksilver, and placed it in such a position that the water of the flume should fall into it. He also placed in the flume, below the bowl, some copper riffles, properly coated with quicksilver. Although the water passing through the flume seemed to be perfectly clear, yet at the end of three months the bowl and riffles were cleaned up and over \$100 worth of amalgam obtained. His mill is driven by water from Carson River, and carried for a considerable distance through a large wooden flume. A month or two since it became necessary to shut off the water and repair a portion of this flume. In making the necessary repairs it was found that in many places the heads of the nails driven into its bottom had been thickly coated with amalgam. Within the distance of about three rods along the bottom of the flume the workmen engaged in making the flume collected over an ounce of amalgam. This was where there were no copper plates or other special facilities for catching the floating particles of quicksilver. The water flowing through the flume was taken from the river below a number of large mills, and, though far from being clear, would never have been suspected of containing floating quicksilver in such quantities as to amalgamate the heads of iron nails. In order to amalgamate iron it must be scratched or polished while immersed in quicksilver, therefore, it will be seen that much material must have passed by before the occurrence of the accidents required for the commencement of the accumulations found on the nails. As another evidence that quicksilver in considerable quantities floats in the water of flumes and streams below reduction works in a state of invisible division, and yet carries with it the precious metals, Dr. Buncher gave us this additional evidence: On a certain occasion one of his workmen required a piece of copper. Remembering to have seen some old sheets of that metal lying near the waste gate of the main flume, he went to the spot, and hauled them out of a puddle in which they were lying, and found them heavily coated with amalgam, and so eaten up that they were hardly thicker than writing paper. The water pouring out through the waste-gate had a fall of about fifteen feet. It did not fall directly upon the copper plates, but in such a manner as to keep them constantly splashed and wet. Mr. Buncher thinks the plates had lain in the place four or five years. Over a pound of amalgam was scraped off them. It appears to us that in these several striking instances of the treacherous and unsuspecting floating away of the precious metals there is for mill-men food for reflection, and for inventors a field in which to reap both profit and distinction."

COUNTERFEITING TRADE MARKS. — Reports have been received at the Treasury Department from Mr. Denman, Special Agent at Shanghai, stating that he expected to be in Calcutta on the 10th of January. He investigated the cause of the decrease on American exportation of drills to China, and ascertained that it was caused by British drills, the manufacturers of which imitated American trademarks and undersell American goods. The Chinese prefer American drills, but the fraudulent trade-marks on British goods have deceived purchasers. Our exportation has fallen off from 250,000 to 40,000 pieces per annum, while the British exportations increased from 14,000 to 250,000 pieces.

USEFUL INFORMATION.

Impure Water.

The *Journal of Chemistry* says: Public attention cannot be too often called to the danger of using impure water in households. The origin of typhoid fever, which so frequently runs through families in city and country, is oftener in wells and springs than is supposed. In cities it is easy to understand, when aqueduct water is not supplied, how wells may become contaminated, but for many it is not so easy to see how wells in the country, among the hills, or in the green valleys, can become so impure as to be sources of disease.

Since the general introduction of aqueduct water into large cities, typhoid fever has become more common in the country than in the city, and this disease is certainly zymotic, or one which results from a poison introduced into the blood. Wells in the country are very liable to become contaminated with house sewage, as they are generally placed, for convenience, very near the dwelling, and the waste liquids thrown out upon the ground find easy access by percolation through the soil to the water. The instances of such contamination which have come to our notice, and which gave rise to fevers, are numerous. The gelatinous matter which is often found covering the stones in wells affected by sewage, is a true fungoid growth, and highly poisonous when introduced into the system. It is undoubtedly concerned in the production of typhoid fever. How it acts it is difficult to determine, but it is at least conceivable that the spores of the fungus may get into the blood and bring about changes after the manner of yeast in beer. These spores, as is well known, develop rapidly by a kind of budding process, and but a little time passes before the whole circulation becomes filled with them, giving rise to abnormal heat, and general derangement, called fever. These fungoid or coniferoid growths are always present in waters rendered impure by house drainage, and great caution should be used in maintaining well waters free from all sources of pollution.

As a solution of the difficulty the *Artisan* says: The use of quicklime in the purification of water has long been practiced by dyers, the philosophy of its action being that, by neutralizing the carbonic acid dissolved in water, the carbonate of lime held in the solution is precipitated, the latter being insoluble in water which does not contain carbonic acid. It is customary to reduce the quicklime to a creamy consistency by the addition of water, and then to mix it with the water to be purified. After thorough incorporation, the water being left to settle for some time, not only the lime added but the carbonate of lime previously dissolved in water, would be found precipitated to the bottom. During the time the water is standing, it may, however, absorb more or less additional carbonic acid, and, therefore, be rendered capable of redissolving a portion of the lime. This defect in the process is much lessened, if not entirely remedied, while the purification of the water is entirely facilitated by immediate filtering after the addition of the quicklime. The carbonate of lime, being rendered solid by the addition of the quicklime, is distributed in very minute particles throughout the liquid. If the liquid be filtered immediately on the addition of the filtering agent, the separation may be effected much more rapidly than by allowing the water to stand and settle.

The patent upon a peculiar kind of filter for this purpose has been obtained by Mr. Gustave De Mailly, a civil engineer of Brussels. He used a filter consisting of a cylindrical vertical case of sheet or cast-iron, furnished with a lid, which case contains another cylinder, which is the filter proper. This last is also formed of sheets of cast or sheet-iron, one at the top and the other at the bottom, and united by three concentric cylinders of perforated sheet-iron. In the two annular spaces thus formed he places felt or wool, which is claimed to be rendered impenetrable by a peculiar process. It is claimed that when water passes through this material, which it does quite rapidly, all traces of suspended carbonate of lime are removed. The cleansing of the filter is accomplished by causing water to flow through it in an opposite direction from that it pursues during the process of filtering.

TO BRONZE GAS FITTINGS.—Boil the work in strong ley and scour free from all grease or old lacquer, next pickle in dilute nitric acid till quite clean (not bright), dip in strong acid and rinse through four or five waters; repeat the dip if necessary till it is bright, next bind it very loose with thin iron wire, and lay it in the strongest of the water used for rinsing. This will deposit a coat of copper all over it, if the water or pickle be not too strong. When too strong the copper will only be deposited just around where the wire touches. When the copper is of sufficient thickness, wash it again through the water, and dry with a brush in some hot air-dust (box dust is best), but oak, ash, or beech will do. It is now ready for bronzing. The bronze is a mixture of blacklead and red bronze, varied according to shade required, mixed with boiling water. Paint the work over with this and dry, and then brush till it polishes. If there are any black spots or rings on the work, another coat of the bronze will remove them. Lacquer the work with pale lacquer, or but very slightly colored, for if it is too deep it will soon chip off.

Test for Arsenical Colors on Wall-papers and in Paper generally.

Professor Hager recommends the following method for detecting this dangerous class of arsenical colors, which, we may remark, are not confined to green alone, for red sometimes contains arsenic: A piece of the paper is soaked in a concentrated solution of sodium nitrate (Chili saltpeter) in equal parts of alcohol and water, and allowed to dry. The dried paper is burned in a shallow porcelain dish. Usually in only smolders, producing no flame. Water is poured over the ashes, and caustic potash added to a strongly alkaline reaction, then boiled and filtered. The filtrate is acidified with dilute sulphuric acid, and permanganate of potash is added slowly as long as the red color disappears or changes to a yellow brown upon warming, and finally a slight excess of ammonium solution is present. If the liquid becomes turbid, it is to be filtered. After cooling, more dilute sulphuric acid is added, and also a piece of pure clean zinc, and the flask closed with a cork split in two places. In one split of the cork a piece of paper moistened in silver nitrate is fastened, in the other a strip of parchment paper dipped in sugar of lead. If arsenic is present, the silver soon blackens. The lead paper is merely a check on the presence of sulphuric acid. According to Hager, the use of permanganate of potash is essential, otherwise the silver paper may be blackened when no arsenic is present.

DYEING VENEERS.—Veneers are readily dyed upon the surface, but in this condition are much more liable to disfigurement than when the color is made to permeate the mass. Those colored throughout are therefore the most sought after, and before the late war were chiefly furnished from Paris. During the war, the supply being cut off, some German cabinet makers took up the subject, and after numerous experiments perfected a process which secures the desired result. The veneers are first soaked for twenty-four hours in a solution of caustic soda, and then boiled therein for half an hour. They are then washed with water until all the alkali is removed when they are ready to receive the dye. This treatment with soda effects a general disintegration of the wood, whereby it becomes in the moist state elastic and leather-like and prepared to absorb the color. Veneers thus treated, if left for twenty-four hours in a hot decoction of logwood, and after superficial dyeing immersed for twenty-four hours more in a hot solution of copperas, become of a beautiful and permanent black throughout. A solution of picric acid in water, with the addition of ammonia, gives a yellow color not in the least affected by subsequent varnishing. Coralline dissolved in hot water, to which a little caustic soda and one-fifth its volume of soluble glass have been added, produces rose color of different shades, dependent on the amount of coralline taken. After dyeing they are dried between sheets of paper, and subjected to pressure to retain their shape.—*Paint and Oil Trade*.

USES OF WASTE PAPER.—Few housekeepers are aware of the many uses to which waste paper may be put. After a stove has been blackened, it can be kept looking very well for a long time by rubbing it with paper every morning. Rubbing with paper is a much wiser way of keeping the outside of a teakettle, coffee-pot or teapot bright and clean than the old way of washing it in ends. Rubbing them with paper is also the best way of polishing knives and tinware after scouring them. If a little soap be held on the paper in rubbing tinware and spoons, they shine like new silver. For polishing mirrors, windows, lamp chimneys, etc., paper is better than dry cloth. Preserves and pickles keep much better if brown paper instead of cloth is tied over the jar. Canned fruit is not apt to mould if a piece of writing paper, cut to fit each can, is laid directly on the fruit. Paper is much better to put under carpet than straw. It is thinner, warmer, and makes less noise when one walks over it. Two thicknesses of paper placed between the other coverings on a bed are as warm as a quilt. If it is necessary to step upon a chair, always lay a paper upon it, and thus save the paint and woodwork from damage.

Tobacco LEAF.—The State Chemist of Connecticut, in his report, presents some interesting information in reference to the tobacco crop, with the results of tests upon the tobacco leaves. The general summary of the reports is as follows: The most highly valued tobacco in New England is the thin, tough, elastic leaf, which burns readily to ashes. Those leaves containing the most carbonate of potash in their ashes, burn the most freely and suitably. In some combinations potash does not favor the burning, and some tobacco manufacturers improve the flavor and burning quality by artificially impregnating the leaf with acetate, citrate, or tartrate of potash, applying the latter in solution and then drying. Chlorine injures the tobacco, as also does nitric acid. Sulphuric acid, united with potash, soda, or lime, favors the burning of tobacco. The best tobacco is produced on well-drained, warm, sandy lands. It is believed heavy manuring increases the quantity of the crop generally at the expense of quality as regards texture.

DOMESTIC ECONOMY.

Cooking Meats.

The most economical way of using meat is to cook it in hot water, and serve it up in its own gravy. If it is boiled for preparing soup, the water should not be too quickly raised to the boiling point, since this tends to coagulate the albuminous portions and to prevent the juices from passing into the water. The meat should be chopped or cut as fine as possible, and steeped for some time in cold water, which should then be gradually heated up to a temperature not exceeding 150° Fahrenheit, or 63° below its boiling point. At the last moment the soup may be allowed to reach the boiling point. The bones should be crushed or broken up into small pieces, and boiled, or rather simmered, for eight or ten hours, in order to thoroughly extract their nutritive matter.

If we wish to cook meat in such a way as to preserve the maximum of nutriment in the most digestible form, we should place it in large pieces in boiling water and keep it there for five minutes. The high temperature coagulates the albumen at the surface of the meat, stops up its pores, and thus prevents the juices from escaping. After this boiling for about five minutes, add cold water to reduce the heat to about 150° F., and keep it at that temperature till the meat is sufficiently cooked. It will then be found to be tender, juicy, savory and nutritious. Salted meat intended to be eaten cold should be allowed to cool in the water in which it has been boiled.

In roasting meat, as in boiling it, the first object should be to coagulate the albumen at the surface, in order to prevent the escape of the juices. The meat should be at first placed close to the fire, kept there for ten or fifteen minutes, and then withdrawn to a greater distance from the heat. If cooked in the oven of a stove or range, the oven should be very hot when the meat is first put into it, kept at the same heat for a short time, then cooled down partially (by opening the door or checking the fire), and the roasting should then be allowed to go on very slowly so that the inner parts may be thoroughly done. The loss of weight (mostly water and fat) is nearly one-third more in roasting than in boiling.

Roast meat has the richer flavor, because certain aromatic principles are developed by this mode of cooking. The occasional "dredging" of flour over the surface of the meat helps to stop up the pores and prevents the escape of the fat. Roasted meat is not so well suited for invalids and dyspeptics as boiled meat, since it is apt to contain acid substances formed out of the highly heated fat. Broiling is a species of roasting, but it ordinarily produces a more digestible food for the dyspeptic. Frying is the worst possible mode of cooking meat, especially for persons whose digestive powers are not vigorous, as it almost invariably develops a very acrid substance known as *acrolein* and many fatty acids that are nearly as unwholesome.—*Boston Journal of Chemistry*.

INTERESTING TO MINERS.—We learn that a patent has been granted to Henry M. Boies, Scranton, Pa., for Improved Packages of Powder Charge for Blasting. This invention consists in packing the powder, in convenient quantities, in long tubes of paper or any fabric or material of sufficient strength, rendered waterproof if necessary, of a proper shape and size to be used as a cartridge, and of such a length in excess of the powder inside as shall allow of its being folded into a compact form, and divided for use into cartridges of any desired length or weight. Each cartridge tube or package may be easily marked with the size, and quantity, and brand of its contents; and when it comes to the consumer, he can measure off from either end the quantity desired for a blast, slide the powder away from this point, divide the tube, fold back the ends, and the cartridge is ready for use, proceeding in the same way until the whole package has been used. Thus the danger of preparing the cartridge over the open keg and the liability to damage of the exposed powder are avoided, and the time and labor of making the cartridge, as well as the materials of which it is composed, are saved.—*Coal Trade Circular*.

Pudding Sauce.—One quart of boiling water, four large tablespoonfuls of white or brown sugar, two of flour, one of butter, one teaspoonful of salt, nutmeg or cinnamon to taste. Two tablespoonfuls of currant or blackberry wine or cider are a great improvement. Let the whole be boiled together for about ten minutes. It is necessary to mix the flour with a portion of cold water before adding it to the boiling water.

Artificial Oysters.—Take green corn, grate it in a dish; to one pint of this add one egg well beaten, a small teaspoon of flour, half a cup of butter, some salt and pepper, and mix them well together. A table spoonful of the batter will make the size of an oyster. Fry them a light brown, and when done, butter them. Cream, if it can be procured, is better than butter.

Warming Cold Boiled Potatoes.—Slice and put them in a basin with a little milk or water, some cream if you have it, and a little salt. Let it remain on the stove until it is thoroughly heated through, stirring often to prevent its sticking; a bit of fish left from a former meal or some beaten egg is a nice addition to it.

GOOD HEALTH.

Drinks During Meals.

The results obtained by Dr. Beaumont in his series of experiments on the person of Alexis St. Martin, who had a permanent gastric fistula, caused by a gunshot wound, demonstrates that the gastric juice, in order to exert its solvent action upon the food, must be at the temperature of 100°.

The common, excessive and alternate use of hot and cold drinks therefore, during meals, is clearly prolific to a host of ailments in manifold ways. It impairs digestion by alternately increasing and diminishing the temperature of the gastric juice—thus retarding the solvent action of that fluid. It lays the foundation for chronic gastritis; in consequence of the excessive and reciprocal contact of the two agents, heat and cold, with the mucous membrane of the stomach, and consequently causes dyspepsia.

It also causes cracking of the enamel of the teeth and an increased susceptibility of the nerves in their immediate vicinity. Many cases of protracted odontalgia, or—in common phrase, toothache, are no doubt due to this bad practice; as also the premature destruction of the enamel of the teeth in persons of healthy constitutions.

This bad habit is the generator of many cases of disordered organs and perverted functions generally in the animal economy.

While I deprecate the use of hot and cold drinks during meals, I nevertheless advocate the moderate use of fluids of milk-warm temperature, for the reason that they act as adjuncts to mastication, insalivation and deglutition of food, and that they assist the gastric fluids in the disintegration of aliments. For instance: it is well known, that, without the assistance of some fluids, it is extremely difficult to comminute a dry and brittle cracker or other similar substance.

Still it is well we think to dispense with fluids to a good degree during mastication, as their tendency is constantly to render the process less thorough and effective.—*Laws of Life*.

PHYSIOLOGICAL PROPERTIES OF CAFFEIN.—The physiological action of coffee, according to M.M. Aubert and Hease, should not be attributed to caffein, but to other principles. An injection of 0.6 cubic inch of coffee containing 0.6 grains of caffein killed a rabbit in a very short time, producing acceleration of the pulse and respiratory organs, uneasiness, and finally convulsions. An injection of 0.75 grains of caffein, however, did not produce death or any symptoms of sickness. An infusion of 770 grains of very hot coffee, corresponding to 6.3 grain of caffein, acted upon a man far more intensely than a stronger dose of pure caffein. Headache, vertigo, trembling, and similar symptoms are produced, which last upward of four hours. Coffee extract, deprived of caffein by chloroform and injected into the jugular vein of a rabbit, causes strong convulsions, but never tetanus, such as is produced by an overdose of caffein singly.

POSITION IN SLEEPING.—Sleeping rooms should always be so arranged, if possible, as to allow the head of the sleeper to be toward the north. Frequently in cases of sickness, a person will find it impossible to obtain rest if the head is in any other direction, and often a cure is retarded for a long time. A Vienna physician had a patient who was suffering from acute rheumatism, with painful cramps running from the shoulders to the fingers; and while his head was to the south he could do nothing toward his relief. On turning the bed, however, so that the head was toward the north, the patient uttered expressions of pleasure, and in a few hours a great improvement had taken place, and in a few days he was almost entirely cured. Many other cases are given by scientific persons; and people in building houses, should always have this in view.

ASPHYXIA BY ILLUMINATING GAS.—The symptoms are discomfort, inclination to vomit, convulsive movements of the muscles, especially those of the breast, the skin is cold, the breathing and pulse irregular. The remedies recommended are exposure to free air, even if cold, irritation of the skin by vinegar, and the palms of the hands, soles of the feet, and the spine with a stiff hair brush, blowing air into the lungs. When consciousness returns, place the patient in a heated bed in a room with the windows open, administer a few spoonfuls of Malaga, Madeira, or sherry wine. A mixture of tartar emetic and Hoffman's liquor, flavored with honey-water and orange-flower syrup, is spoken of as efficacious after the return of consciousness.—*Le Gaz*.

SCARLET FEVER FROM A DEAD HORSE.—Scarlet fever having attacked a whole family at the port of Amble, one of whom has died, Dr. Easton, the medical officer of health, has reported to the local authority his belief that the fever was produced from the family residing near a pond in an old quarry, in which was a dead horse. The family lived over a boat-house on the lake, and being quite isolated, the fever has been confined to the inmates. Orders have been given to prevent dead animals being thrown into the pond.

CHAPPED HANDS.—Instead of washing the hands with soap, employ oatmeal, and after each washing take a little dry oatmeal and rub over the hands, so as to absorb any moisture.

Aveling & Porter's Road Locomotive.

The illustration accompanying this article is taken from a photograph of one of the Road and Farm Locomotives built by Messrs. Aveling & Porter, of Rochester, England.

The large cost of the English rope system of Steam Plowing Machinery seems almost to preclude its general adoption in America. Messrs. Aveling & Porter after repeated trials and experiments with other devices say:—That with an engine weighing not more than five tons, and this weight carried on broad wheels such as the engraving illustrates, from 6 to 10 acres per day, varying with the nature of the soil, can be plowed with a four-furrow plow. The same sized engine, they further say, is more than sufficiently powerful to drive the largest sized threshing machine, and 15 tons can be easily hauled by it along moderate roads and up steep inclines. "To this date Messrs. Aveling & Porter have built more than 900 of

makes her a great favorite with the farmers, who have been bored with hitching their horses to a heavy steam engine, and spoiling them with the over load. Our greatest gain is in time, moving from place to place. In five minutes after the last sheaf is through, we are on the road; and we once moved 600 feet, and were threshing again in 10 minutes from the time the last sheaf was through at the last place (by a watch held on us by a friend). We are now drawing pork in the streets of Cincinnati, and we draw from 12 to 15 tons a load."

"Until June 1874, 'Steam Plowing Machinery' is admitted to the United States free of import duty." To Mr. W. C. Oastler, of 43 Exchange Place, New York, the manufacturers agent, we refer our readers for further particulars if desired.

CONSOLIDATED VIRGINIA BULLION.—The Virginia Enterprise of the 5th says that the Consolidated Virginia mine shipped the day before,

The Goodwin Fire Engine.

Messrs. Goodwin & West, manufacturers of the Goodwin Pump, a recent California invention, are manufacturing at the Miners' Foundry, a new steam fire engine, which is intended to supersede any other engine over manufactured in America or any other country. It is constructed on the principle of the Goodwin pump, but the special novelty in it is, that it is calculated with a pressure of 400 lbs. on the pump and 100 lbs. on the engine, to throw a 1½-inch stream 320 feet with 100 feet of hose. The engine itself is very handsome in its finish and ornamentation, and is exceedingly light, weighing at least 500 lbs. less than the second-class Amoskeag Engines; and the pump can be taken apart easily and without interfering with the working gear of the engine, or any other portion of the machinery.

The machinery is all very closely connected, the engine being set well down on the center

Liquid Slate Roofing.

We have received several communications in regard to an article describing the patent slate roofing, which was published recently, and inquiries as to cost, means of obtaining, etc. In reply, we would say that we have written to the manufacturers of this roofing, asking for all particulars desired, but have not as yet received an answer.

For those who did not notice the article referred to, an explanation of the new process may not come amiss. The slate dust, which accumulates in such quantity around the quarries, was until quite lately considered a waste product, and was, moreover, a source of annoyance and inconvenience to the stone workers. But it was found that by mixing it with certain ingredients, a paste could be formed which, while plastic and capable of being molded into any shape, would become perfectly indurated and compact on drying. The compound,

AVELING & PORTER'S ROAD LOCOMOTIVES, ADAPTED TO DIRECT TRACTION STEAM PLOWING.

these engines and are at present making six a week." "The Telford Pavement Co., of Plainfield, N. J., have two of the Aveling engines which they have used during the year for hauling broken stone for road contracts, and their testimony is that the work has been performed by the engines at less than one-third the cost of horses and mules." Mr. Diok, of Rass, Ohio, writing of his Aveling engine says:—"We have used our engines for almost all possible purposes: On the gravel road; for drawing logs out of the woods; for threshing grain, and are now hauling pork in the streets of Cincinnati, over a boulder pavement.

"On the macadamized road we draw from Hamilton to Venice, including wagons, 25,000 lbs. of coal, at one load—a distance of eleven miles. For logs in the woods, she is unequalled; we detach the engine from the wagon, and roll the tree on to the wagon, an inch at a time if we choose, and hold it there—a feat that horse power will not perform. All who see her at this are amazed at the wonderful power we possess, and say she seems a thing of life.

"We drew a tree of an average girth of over 7 ft. and 73½ feet in length from our timber, about four miles distant, and we calculate it weighed eight tons or more.

"We have threshed nearly 40,000 bushels of grain with her since harvest, and have found no place that we were unable to reach, no matter what the grade or how deep the mud. Her facility for taking herself and thresher away,

\$108,473.94, the product of ore reduced by their mills during the past week. The yield of the mine for the months of November and December (which is, in fact, the total yield of the mine since the development of paying ore) was \$644,094.13. Many more stamps are now running on ore from the mine than were at first employed. By the shipment made last evening it will be seen that the yield is rapidly increasing. The daily yield of the mine is at present 250 tons of ore, and the mine is looking well throughout. The north winze, which is down 152 feet, is in good ore the whole distance.

CHANGE OF FORM.—The American Artisan, so long and well known as a weekly journal of general scientific progress, with the opening of the new year is to be issued as a large monthly, in magazine form. We have always recognized the Artisan as one of our very best scientific exchanges, and are confident that if, in its new form, it only maintains its previous uniform excellence, it will take rank at the head of American journalism—but we are promised even an improvement for the future. The Artisan has our best wishes.

CARSON RIVER.—There is no longer complaint of a scarcity of water in Carson river. The late thaw has sent floods of water pouring into that stream from hill, vale and mountain gorge. All the mills are in full blast and their stamping outcrops the combined waters.

of the boiler. Any part of it can be oiled while in operation, and the pump can be taken apart, if necessary, without interfering with the engine. The pump is a 12-inch one, running entirely upon rollers, without any sliding motion, the inside chamber revolving upon the periphery as 1 is to 9.

All the wear and tear is taken up by an inside eccentric with a girth and key. The inside motion is taken up by outside screws on the side of the pump. The cut-off is worked automatically from the outside by the use of eccentrics on shaft taking all the pressure off from the periphery of the inside cylinder. The motion of the valve is adjustable from the outside. These pumps can be worked almost any length of time without opening, particularly in fire-engines, and are adaptable to mining, irrigating, agricultural, domestic and every other purpose for which a pump can be applied. A small steam pump of this pattern was tested last month at the Miners' Foundry with very satisfactory results. Size of pump, 4½x9. Pressure of steam, 45 pounds, 20 feet from boiler. Length of hose, 6 feet. Length of stream, 75 feet. Revolutions, 300 per minute. The steam fire engine being built there will be a very handsome one, and is well worth seeing by those interested in such machinery.

It costs \$5 a ton to get hullion from Los Angeles to the anchorage, and \$2.75 from there to San Francisco.

then, is neither more nor less than ordinary slate, supposing the latter to be possessed of the additional good qualities which have been secured. It is certainly water-tight, and is claimed to be a reliable defense against fire. At all events it would prevent falling sparks and cinders from igniting the wood work beneath, in the same manner that natural slates do. We see no reason why this liquid slate could not be so tinted by admixture of various mineral oxides as to take the place of the tessellated designs which make ordinary slate roofs, when artistically planned, so much admired. It appears that the new compound has been already adopted quite extensively in Eastern cities, and that in a quiet, business-like manner, its manufacturers have been steadily enlarging its use, while the general public, and all not immediately concerned, were ignorant of its very existence.

ORE SHIPMENT.—Ninety car-loads of ore from the mines on the Comstock are shipped daily over the Virginia and Truckee railroad to the various mills. The Gold Hill News says that the amount of ore shipped by rail to the various mills in that vicinity, during the month of December, was 2,534 car-loads, or about 18,000 tons.

There are in this State 780 mining ditches, having an aggregate length of 4,888 miles, and supplying 220,187 inches of water per day.

Alpine County Mines.

Monitor District.

The Alpine *Miner* in its general mining review, has the following about the mines in Monitor district: Monitor, although unlike any other district in the county, is second in importance and interest to none of them. When a long distance away the curiosity of the gazer is aroused by the many tinted peaks of this region. There is the General Shields, of a bright buff color, Red Mountain, of a deep vermilion, and Monitor Peak, with all the intermediate shades between buff and vermilion. The vast outcrop of the ledges cutting across the faces of these lofty mountains, some peering out from among, while others overtop the tall pines that are scattered over their sides, form such a picture as is seldom seen in a mining region. Upon a near approach to these vast repositories of the precious metals, persons at all excitable become enthusiastic in their belief in the riches of the mines of that section. This, like Alpine district, has the advantage of an unlimited water power with its five miles of frontage on the Carson river. From Bullion to the town of Monitor, a distance of two miles, following the windings of Monitor creek, the traveler crosses one of the most extensive belts of mineral-bearing ledges in the whole country. We will mention a few of them: Florence, Manchester, Three Sisters, Mountain, Constitution, Ahe Lincoln, Hercules, Blind, Detroit, Chicago, Esmeralda, Ohio, Tarshish, Sunshine, Wild Yankee and American. These are but a few of the many that were located and worked upon in the early days of the district. In the fall of 1862 John D. Marks, Jacob Brandebury and Warren Burright were working away on the Esmeralda lode, situated about half a mile below the town, when Mr. Burright suggested to his partners that they put a blast into a point of rock jutting out into the creek just below where they were working. The suggestion was acted upon, and a blast put in which blew off perhaps half a ton of ore that assayed all the way from \$65 to \$3,000 to the ton. In a short time the good news spread and began to attract the attention of parties from the outside, who visited the locality during the winter, and by spring a great rush ensued. It is safe to say that one blast in the Esmeralda cropping, laid the foundation of the mining operations that have been carried on so extensively, for up to that time nothing more than fair indications had been met with.

The history of the Marion—i. e. the name of the incorporation that undertook the development of the Esmeralda lode—subsequent to '63 is but a repetition of those heretofore given in Silver Mountain and Alpine districts—inadequate capital, discouragement, and final suspension. It is a firm and settled conviction in the minds of all the old settlers that in the Marion there is the making of one of the richest mines on the coast. The discovery of the Florence lode was the next great sensation. A man by the name of George Probasco came into camp early in the spring and spent a few days in looking around. On one of his excursions down the creek, in following along its bed, he found under the top of a fallen tree a mass of blue clay matter that excited his curiosity. Upon closer inspection with pick and shovel, it proved to be the top of a ledge which had become decomposed by the action of the water of the creek. In this mass of clay he found specimens of ore that had every appearance of native silver, but which in reality was nothing but a rich galena. Probasco went nearly crazy over his discovery, and when at a later day Dr. Hughes of Carson offered him \$12,000 coin for a controlling interest in his mine, he quite indignantly refused the offer. The result is that his mine remains to-day in much the same condition it was when discovered.

The Manchester mine, owned and worked by a San Francisco company, made some important developments, clearly proving the value of their property, but on the death of Mr. Henry Dreschfeld, the leading spirit of the organization, work was suspended in the early part of '65, and though frequently spoken of since by members of the company, has never been resumed. On the adjoining claim on the Manchester lode, known as the Merrimac Company, a tunnel was driven a distance of nearly two hundred feet, showing ore of a good quality of the same general character as that in the first mentioned mine. This ore is of the class known as argenteriferous grey copper, some of it carrying as high a percentage of silver as \$700 to the ton. The depth on either mine was comparatively slight, but sufficient to demonstrate the continuity of the vein, both the vertical and horizontal. To cut this ledge, the Florence, and some half a dozen others in the same belt, a location for a deep long tunnel was made by J. P. Ray, S. G. Lewis, and others, and called the Winchester. For three years Ray vigorously pushed work on this tunnel and drove into the mountain 1,065 feet, cutting in that distance the Florence lode some 400 feet in, and at a depth of 150 feet. The lode was well defined, 15 feet thick, with a vein of ore 5 feet. At 648 feet the Manchester lode was cut, showing a large ledge with clay castings on both sides. This ledge gave good assays, but nothing was done towards opening it up further than the running through it. At the extreme point reached by the tunnel another ledge was struck into, but never cut through. This last ledge is supposed to be the Constitu-

tion, which crosses the road and creek about one mile below town. The Winchester is a valuable property, and at no distant day may be extensively worked.

The Constitution, just below the Globe mill, owned by the (in) Active Company, of New York, is a master vein, being 20 feet between the walls, and carrying an argenteriferous copper ore with flakes of native copper liberally interspersed through the gangue. But little work has been done upon this mine. It was one time bonded to the Globe Company for the sum of \$3,000, which was cheap as dirt.

The Chicago and Detroit is located on the Esmeralda belt of ledges, and has as good a prospect for a rich mine as any reasonable company ought to desire. They have cut three veins in a distance of 300 feet, on one of which a drift has been run 100 feet, showing a continuous vein of low grade ore that can now be made to pay by the improved methods of reduction. One of the veins, which gives the greatest promise, has not been touched further than running through it with the main tunnel.

The Imperial Company is an English organization which commenced at a point on Carson river, just above Bullions, to drive a double track tunnel from the river under the summit of Mt. America, and thus cut all that vast belt of ledges lying between Monitor and the river. They persevered until 1,300 feet of tunnel had been made, when they succumbed from pecuniary. This is a most insignificant property, and it is hoped that work will be resumed on it at no distant day.

The Pig Iron Market of San Francisco.

The circular of William Jeffray, coal, metal and merchandise broker, gives the following information about the state of the iron market in this city, during 1873:

The monthly quotations given below will show that the market has been of an unusually steady character during the year; consumption and importations footing up considerably less than 1872. Glengarnock has realized from \$2.00 to \$2.50 per ton over Eglinton, Clyde and other brands, its importation being hardly equal to the demand, whereas the latter named brands constitute the major portion of soft iron on hand.

Several extensive purchases of soft iron were made here at, from \$52.00 to \$54.00 per ton, "to arrive," shipments to be made during the months of April and May.

The light consumption this year, as compared with the two former years—3,387 tons less than 1871 and 1,112 tons less than 1872—has been occasioned by the decreased amount of building, and light orders for mining machinery, both of which are anticipated to be very largely increased this year.

The following will give the monthly quotations for the past year:

SCOTCH SOFT.		PER TON.
January	\$50 to 54
February	50 to 54
March	50 to 54
April	50 to 54
May	50 to 54
June	50 to 54
July	50 to 54
August	50 to 54
September	50 to 54
October	50 to 54
November	50 to 54
December	50 to 54
ENGLISH AND AMERICAN WHITE.		PER TON.
January	\$52 to 52½
February	52 steady
March	52 to 52½
April	52 to 52½
May	52 to 52½
June	52 to 52½
July	52 steady
August	50 to 54
September	50 to 52
October	50 to 52
November	50 to 52
December	50 to 52

I find the stock of pig iron on hand January 1st, 1874, in all 7,786 tons, consisting of 6,246 tons soft and grey, and 1,540 tons white, as per statement below, being 785 tons less than the stock on hand January 1st, 1873.

Shipments at present in transit from England are comparatively light, but considerable shipments have been, and are being made from New York, from which source we have had but small shipments for a number of years.

	TONS.	TONS.
Stock of Pig Iron on hand Jan. 1st, 1873	8,571
Importations of Pig Iron for the year 1873—Soft, 6,982 tons; White, 1,355 tons—total	8,337
		16,908

STOCK ON HAND JANUARY 1ST, 1874.	
In Importers' hands, Scotch Soft	3,749
White	750
In Foundrymen's and Jobbers' hands, Scotch Soft	2,277
In Foundrymen's and Jobbers' hands, White	780
Grey	220
	7,786

Consumption of 1873—White, 923; Soft, 8,190.....9,112

The above synopsis shows the consumption of 1873 to be 1,112 tons less than 1872, and the importations of the year to be 4,831 tons less than 1872.

Amador County Mines.

The Amador Ledge, of the 27th, contains a letter from Butte City, from which the following is extracted:

Between Butte City and the Mokelumne river, in Joe's gulch, a newly discovered quartz ledge is being opened by Adam Smith & Co., which promises to become one of the best-paying mines in the county. The shaft is at a depth of twenty-five feet, the lode is four feet in width, and six inches of the ledge, just adjoining both the foot and the hanging walls, shows free gold in considerable quantities, and it is estimated that much of the rock taken out will pay at least \$60 to the ton.

In a direct range, and not far from where the prospecting of this ledge is being done, is located what is known as the Wiley mine, now owned by S. W. Bright and J. W. Brown, and has, with the exception of a few months' prospecting, remained unworked for the past fourteen years. As far as worked it has proved to be what is usually termed a "pocket mine," though nearly all the rock taken from the lode paid extraordinarily well for crushing. At the time it was being mined, between the years 1855-'58, the lead yielded enormously, paying from the very surface, with increasing plentifulness, till fifty feet in depth was reached. The "chimney" of the ledge is about 100 feet in length, and has been pretty thoroughly worked to the lower level, and the most of the gold came from pockets in the decomposed quartz. It was not unusual to find from \$100 to \$500 to the ton. One nugget of \$700 in value was found on the very surface. The want of sufficient capital has long prevented the further development of this extraordinary mine; but work on it will be resumed the coming spring.

A few years ago a pocket was found a short distance below the Wiley lead, on the northern slope of the hill, from which \$1,000 was panned out in two days by a couple of boys, who had discovered the gold where it cropped out of the surface of the red-rock in a race where water had been run in mining off the surface earth. This rich mass of decomposed quartz had every indication of being a slide from the main Wiley lead.

On Murphy's Ridge we find for nearly a mile in length by three-fourths of a mile in width, one uniform mass of gold bearing quartz veins, interwoven in slate and granite, and all dipping towards the center of the ridge, thus unmistakably indicating a concentration in the direction of the "mother lode" which is rationally supposed to be not very remotely sunken beneath the surface of its almost numberless tributaries, of which so many have heretofore afforded a treasure to fortune seekers, while those which are now being worked still continue their remunerative yields. The principal composition of the shallow earth capping the ridge seems to be decomposed quartz, and all contains more or less gold. The best pay thus far has usually been found in pockets, commencing immediately underneath the surface dirt and extending to various distances of not very great depth. Several years ago a company of three Germans took in a pan, in less than half a day, \$5,000, all the gold being nearly free from undecayed quartz.

The section of the ridge at present bearing the most favorable indications is in the immediate locality known as the Sylvester claim, which has been almost continuously worked for the last fifteen years, and considering the limited manner in which the labor on the mine has been prosecuted, it has paid astonishingly well. The slate, with which the quartz is profusely intermingled, is much broken and decayed, and has gold entirely through it. The style of working the claim has been, and at present is, to dig and pulverize the slate and rotten quartz during the dry portion of the year, panning or rocking the pockets found in the meantime, and then wash the remaining part during the winter season. Much of the decomposed quartz and slate are thickly studded with sulphurets which are richly and visibly impregnated with gold. For a mile distant from the lower end of the ridge toward the Mokelumne river the same singular formation continues, and though not as thoroughly worked as Murphy's ridge has been, many rich deposits on the range have been found, among them the noted Spanish mine, located near the head of Spanish Gulch. Like the ridge of which I have been speaking, this whole section remains undeveloped, solely for the want of necessary prospecting means.

The Amador Canal and Mining Company have completed three miles of their canal in Amador county, since November 1st. Have six miles to build to complete their whole work. Their canal will be forty-six miles long. It is the largest running ditch in the State, being ten feet on top, six feet on the bottom, and three feet deep. Will supply the Amador, Oneida, Kennedy and other quartz mines in Amador county, with motive power for machinery of mills and shafts. Will supply water to extensive placer diggings, and for irrigation.

ST. HELENA GOLD MINE.—Five tons of ore from the St. Helena (Napa) mine have been shipped to this city. An assay of the ore, made December 20th, by Leopold Kuh, gives the following result: Silver, \$93.57; gold, \$20.17. Total, \$113.74 per 2,000 lbs. Work is going on now very rapidly. Three hundred tons have been taken out, ready for working. The mine was opened as a gold mine, but has developed after the manner of the Gould & Curry, into a first-class silver mine.—*Alta*.

The Big San Bernardino Ledge.

Of Captain S. T. Curtis, one of the present owners, we have some interesting particulars in regard to the recently discovered mammoth gold-bearing quartz lode in San Bernardino county, California. The great vein is situated on a ridge composed wholly of quartzite. This ridge lies between Holcomb and Bear Valleys, on the eastern slope of the Sierras, and about twenty-five miles north of Mount San Bernardino, one of the highest peaks in Southern California. Holcomb Valley is 8,240 feet above the level of the sea and the mine is some hundreds of feet above the valley. The great ledge cuts through the ridge of quartzite we have mentioned, and has been traced about two miles. Through this distance it crops out at intervals, sometimes just above the surface, and again to a considerable height. On the claim of the Gold Mountain Mining Company, purchased by Captain Curtis and others, and which comprises 4,500 feet on the summit of the quartzite hill, the lead is about fifty feet wide, and crops out the full length of the claim to the height of from thirty to sixty feet.

In these croppings gold is to be seen in almost every part with the naked eye, even where the rock is sixty feet above the surface. The lowest assay ever obtained—which was from a piece of what seemed to be almost wholly quartzite—yielded at the rate of \$18.71 per ton. From this the assays run far up into the thousands. A piece of the rock in which not a particle of gold was visible, assayed in San Francisco, showed over \$3,700 per ton in gold. Wherever the lead crops out, gold is to be seen with the naked eye, and much that is quite coarse. Mr. Curtis estimates that there are in the croppings and that can be quarried out, no less than 600,000 tons of quartz. In other places along the lode at least the same quantity may be quarried. Mr. Curtis set some men at work on a drift which is to be run lengthwise into the lead, a distance of 160 feet, when a depth under the croppings of 160 feet will be attained. It is then the intention to make cross-cuts. This is being done for the reason that as yet nothing is known of the interior of the vein, it having only been prospected by breaking rock off the croppings. The principal locations on the lead are the Littlefield, the Hub and the Mojave Chief.

Besides the 4,500 feet of ground purchased by them, Curtis and party have bounded another claim of 3,000 feet. They have also secured large tracts of timber land and an abundance of water. Wood is abundant and can be had, delivered at the mine, for \$2.25 per cord. Lumber, likewise delivered; can be had at from \$13 to \$15 per thousand. Labor is also cheap, and with a proper 50-stamp mill ore can be reduced at a cost of \$2 per ton. About two miles from the mines of Curtis & Co., some Mexicans have been at work about two years with arrastras, and have taken out a large amount of money. They are on the same lead which is now creating so much stir.

The big lead was discovered by a Mr. Carter, who had been engaged in prospecting for his brother in the neighborhood at \$40 per month. He had met with but little luck, and one evening, while going home from work, resolved that he would quit. He stopped in a ravine and stood leaning against a huge boulder ruminating upon his hard luck. The sun was setting and as its rays fell upon the rock upon which he was leaning, he saw particles of gold glittering all over it. The next morning he went up to the top of the hill and found the huge rich croppings mentioned above. The reason that the lead was not sooner discovered, was owing to the fact that the whole foot of the hill being quartzite, no one thought of there being anything else at its summit. A man said to Mr. Curtis: "I have been in this region fifteen years, and have walked about this hill a thousand times; when I think of it I feel like taking a pistol and blowing my brains out." Even though there should be nothing but what is to be found on the surface, the lead is one of the biggest finds of the age.—*Virginia Enterprise*.

EUREKA AND PALISADE RAILROAD.—Dispatches from Palisade, dated the 30th ult., say: A gold spike was presented to-day to the Eureka and Palisade Railroad Company by Holland, of the Pioche Record. Notwithstanding the extreme cold weather which has prevailed in this section of the country for the past four weeks, work on the Eureka and Palisade Railroad has been pushed forward rapidly, and by the last of this week eleven miles of the ground bed will be ready for the ties and rails. Work on the bridge crossing the Humboldt at this place is progressing favorably. They have about half the piles driven, and it will be completed by the fifth or sixth of January. The offices of the company are in course of construction, and from present appearances it will be but a short time before the iron horse will replace the stage-coach and freight-teams between this point and Eureka. M. Salsbury, E. Woodruff and W. H. Ennor are here looking after the work, and there is no doubt of the early completion of the enterprise. About one hundred and fifty men are employed at the present time, and more will be added as soon as the weather is more favorable.

AROUND GRASS VALLEY, fuel for the quartz mines is getting scarcer and higher every year, and as the mines must not be "shut down," a railroad will have to be sent out after fuel.

Wulfenite or Molybdate of Lead.

The Salt Lake Tribune says: The superb specimens of this rare mineral, found in Box Elder county, have naturally excited much comment, as nothing so fine has ever been seen before as these specimens, even among the beautiful products of the Hungarian and Moldavian mines.

Prof. Silliman first called the attention of mineralogists to the fact that in the Wasatch ranges of mountains, this species replaced the phosphates of lead or pyromorphite commonly found as a characteristic mineral in lead mines. Prof. Silliman's paper on this subject was published in the *American Journal of Science*, ("Silliman's Journal") in March, 1872, and was generally reproduced in other scientific periodicals. The specimens of this species first found by him occurred in the Emma mine, in extremely minute crystals, which had escaped the notice of previous observers, but he found the same species also in ores from Swage and Davenport and other Little Cottonwood mines, and a diligent search failed to detect pyromorphite among the ores of this mining district. He also found the Wulfenite among the ores from Big Cottonwood and the American Fork, and was thus led to venture the generalization that it would prove to be the characteristic species of the Wasatch range. This prediction has been remarkably verified since by discoveries in Tecoma, and shows the value of an accurate and minute knowledge of mineralogy in the study of mining districts.

Prof. Silliman has had certainly a full share of abuse for his statements respecting the Emma mine, but we recall with distinctness his bold prediction in 1871, that the Emma was upon a great mineral vein, and his reasons then given for this opinion. Since that time Mr. Clarence King has rendered his remarkable testimony in the case of the Enreka vs. the Richmond Consolidated mine, in which he gives the most cogent and unanswerable reasons for regarding that mine, in limestone, as being a true fissure vein of the class known as pipe veins, and quotes the Emma as another example of the same kind of vein. Both are in his judgment filled from great depths and differ from fissure veins in crystalline granite rocks only from being limestone. Those who sneer at the Emma as being only a "deposit"—a "pocket"—"a cave," or anything else but a deep-seated vein which will hold in depth, will do well to read Mr. King's testimony, and remember that he has only rehearsed with more fullness of detail and amplitude of illustration, just what Prof. Silliman declared to be true of the Emma in October, 1871. We have full confidence in the future of this great mine, for a time under a cloud, but sure to shine out again to the confusion of enemies and the joy of all Utah, not to mention its shareholders—poor, timid, distrustful souls.

Shoshone District.

Some days ago we noticed John Whitebill, brother of the State Mineralogist, passing through on his way South. On Wednesday last the gentleman returned and reported having been in Shoshone district, situated about 130 miles from here, where he had been examining the mines of that section. Mr. W. has samples from the Indian mine which he exhibited to us. The general appearance of the ore is very encouraging, being sulphurets of silver contained in pure quartz, and will assay into the thousands. The ledge is represented as extending a distance of a mile and a half, showing rich cropping all the way. An incline has been sunk at one point to the depth of forty-five feet, all the way in ore. Shoshone district was discovered some years ago and many locations made there, but its great distance from communication has rendered its development slow, consequently leaving it, like many other valuable properties, almost unknown. Now by means of Travis & Co's stage line to Pioche, the distance to the mines has been very materially shortened, as, leaving the stage road at Patterson's, one hundred miles south from here, only twenty-five miles has to be accomplished to the locality, which can easily be done on horseback. We are informed that the late trip of Mr. Whitebill was made in the interest of some parties at Salt Lake who contemplate a purchase. We are glad to note a renewal of interest in this section of country, as, should active operations be commenced there, other and more important mining interests will be opened to capitalists in the immediate vicinity. Adjacent to Shoshone lie Pahranagat, Ten Piute and other districts which, years ago, attracted the attention of prospectors to a great degree. Undoubtedly a rich country lies south of us which only needs the necessary adjuncts of wealth and labor to open them to speculators. We are promised additional facts in this connection shortly which we shall take pains to lay before our readers when received.—*White Pine News*.

SILVER BRICK.—We were shown yesterday by W. T. Golden, Esq., a fine silver brick, the product of 3,300 lbs. of ore, taken from the Silver Clond mine, at Camp Floyd. It weighs 107 ounces, and is of the value of \$130.87. A vein of free milling ore has been struck in the mine, assays of which have gone as high as \$4,000, and the average yield is about \$50 per ton. Operations have been suspended during the stormy weather, as the company have no ore house erected. The mine is opened by a shaft 60 feet in depth, and a level 200 feet long.—*Salt Lake Tribune*.

Interesting to Quicksilver Miners.

An improvement in processes for purifying quicksilver has recently been patented by James B. Randol and Charles W. Wright, of New Almaden. The invention relates to an improved process for purifying quicksilver of the soot and other foreign matter which becomes intermingled with it in any other way. The blast or draft which draws off the mercurial fumes into and through the condensers from the furnace where the ore is sorted, also carries with it a mechanical mixture of fine dirt, particles of unconsumed carbon, some ash, some undecomposed cinabar and various other impurities, and minute particles of the metal. This combination of matter is deposited in the condensers in a condition resembling lamp-black or paste, it having become moistened by the steam introduced from the fuel and ore, and as a consequence it becomes intermingled with the quicksilver. The object of the invention is to separate this soot or mixture, or other foreign impurities, from the quicksilver. To do this the quicksilver intermixed with soot or other extraneous substances, is placed in an iron, or other suitable vessel or tank, to which water, heated to the requisite degree, is added, and the substances intimately mixed. Wood ashes, or other suitable alkali, are then added for the purpose of still further cleansing the quicksilver, which will flow forth in a bright stream from a pipe properly placed in the vessel. The claim granted by the letters patent is "The process of purifying mercury by treating it, under agitation, with heated water and alkaline matter, substantially as set forth." This process is used at New Almaden and has proved a great success, largely increasing the amount of quicksilver saved from the soot, and also reducing the cost for labor as compared with the old method of separation.—*San Jose Mercury*.

That Volcano.

A correspondent of the *Union*, writing from Pinto, December 20th, says: I notice in your paper of December 6th, the following: "A volcano has broken out in the Piute mountains, ten miles east of Eureka, Nevada. There is a heavy black smoke constantly issuing from the crater. Several gentlemen visited the place and brought back specimens of lava which had been thrown out."

As this telegram has doubtless been going the rounds of the press, creating the impression that a real volcano does exist in our mid-t, and being a resident, this winter, of Pinto district, I must state that no natural phenomenon as that alluded to above, has occurred in our peaceful community. The report of the breaking out of a volcano was not, I believe, a fabrication, but resulted from the following facts: A man by the name of Davis, passed through Silverado Cañon, stopped and kindled a fire near a fissure at the base of a cliff forming one wall of the cañon. This fissure connecting with the surface above, and being partially filled with inflammable debris (raven's nest, etc.), the fire communicated with the fissure by the draft created from the burning fuel below, and the smoke ascending upward produced the impression among some miners on the opposite side, of the appearance of a real volcano. This occurred a few days after several slight shocks of an earthquake; hence the report. Silverado Cañon presents many interesting features to the geologist. Its walls on one side tower nearly perpendicularly several hundred feet in height, and its strata (silicate of lime) are bent and distorted in every angle from the horizontal to the perpendicular. Its distorted and semi-metamorphic strata, containing numerous seams, cracks and fissures colored red and yellow by sublimed silicates and carbonates, attest to the violence of past volcanic disturbances. The specimens of lava returned from the reported volcano belong to another geological age. Since that time the wash and wear of the debris of centuries have filled portions of this cañon many feet in depth, and in other places expose indications of mineral deposits outcropping on terra firma.

MILLS' SEMINARY.

The next term of this well-known institution will commence

WEDNESDAY, JANUARY 7TH.

With its healthy location, ample grounds, commodious buildings and large, efficient corps of teachers, the institution offers unrivalled facilities for a thorough and finished education. All letters of inquiry and all communications relative to admission should be addressed to

REV. C. T. MILLS,

ds27-2m

Brooklyn, Alameda Co., Cal.

The object of this school is to impart a thorough education in business affairs. It is open to persons of both sexes and of all ages. There is an English Department for those not sufficiently advanced for the Business Course. Sessions continue day and evening throughout the year. Students can enter at any time. All wishing to be successful should secure a practical education at this College. Send for "Herald's College Journal," and learn full particulars. Sent free to all by addressing E. P. HEALD, Pres. Business College, San Francisco, Cal. 2v27-1y

Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday evening last, at their rooms on Clay street. A. P. Elfeld, Matthew Turner, and Levi M. Kellogg were elected resident members. After the donations to the museum had been presented, the President, Prof. Geo. Davidson, read his annual address, from which we make the following selections, showing the advance of science on this coast:

The past year has been a notable one in the history of the Academy. The appeals which our labors have made to the citizens of San Francisco have yielded the most gratifying fruits. We commence the New Year with fresher inspirations, and with stronger assurances of raising the Academy to the highest possible position for good. A deep interest has been manifested in our proceedings, as fully exhibited by the large attendance of members and their friends, and by the liberality of our associates.

Since the revivifying of the Academy in 1866, we have steadily moved forward, even where so many elements were in direct conflict with it. Although we are not in a position to-day to make absolute promises, we yet see broad daylight opening upon our struggles for scientific life. Almost within our reach has arisen what we have ardently and persistently worked for.

Prosperity of the Society.

Two years since our balance sheet showed about one hundred dollars in the Treasury, yet the unpaid bills indicated a large sum in arrears. Last year we had in hand a balance of \$1,568, less the amount required for the printing of the proceedings of the year. To-day we have \$3,000 invested, and about \$1,400 in the hand, subject to the bills for the reprinting of first volume of proceedings. And this, notwithstanding we have paid for the partial services of the Director of the museum; purchased cases for the museum and library; added books to the library; specimens to the cabinet; and incurred an unusual sum for printing and engraving. In fact, our expenditures have been nearly \$3,000. For the year the income from interest paid was \$195; from regular dues, \$2,100, whilst from life members was received the handsome sum of \$3,500.

During the year we have lost by death two of our resident members, E. Deunison and W. P. Pritchard, and two of our honorary members, John Torrey and Louis Agassiz, both so lately our guests. The services which the Academy conducted in memory of the latter are still fresh in your recollection. We can hardly expect to increase our membership in succeeding years in the same ratio, but we shall endeavor to awaken among our younger men an interest in our work and investigations. In the ordinary course of nature they must succeed to our places, and it is our duty to use every effort to induce them, as early as practicable, to share in the labors we have initiated.

The Publications.

The preparation of the material for the volume of the proceedings of the past year has fallen almost entirely upon Mr. Stearns, of the Publication Committee, and whilst he can best inform you of the quantity that has been published, the members cannot know the months of personal attention and supervision which he has unselfishly given to it, and only those conversant with the vexatious trials of the proof-reading of technical papers can appreciate the care and attention which every line and every word demands. In addition to the two parts of the proceedings of this year, the Trustees directed the republication of the first volume of the proceedings of the Academy, now out of print. This has been supervised by Mr. Stearns, and the plates engraved under his direction.

As an account-current of the activity and prosperity of the Academy, it is pertinent in this place to note what has been printed since its organization in April, 1853. At the close of 1857, four-and-a-half years after its birth, the first volume of its proceedings was completed, with 110 pages. The second volume, which was completed in 1862, embraced 236 pages, with index. At the close of 1867 was completed the third volume, in five parts, comprising 411 pages, without plates. During 1867 was also published Mr. Lesquereux's *Mosses of the Pacific Coast*, 38 pages, quarto; and *Richthofen's Natural System of the Volcanic Rocks*, 94 pages, quarto. At the close of 1872 was completed the fourth volume, in five parts, comprising 322 pages, with the plates. During the past year there have been published the first two parts of volume V, comprising 224 pages, with illustrations through the text, and 10 plates. Also the republication of the first volume, embracing 126 pages and five plates.

Efficiency of the Officers.

The labors of the Secretary have been faithfully performed, and involved a large amount of work, as he not only acts as Secretary to the Academy, but also to the Board of Trustees. The extent of the proceedings already noted, exhibit the increased amount of labor now falling upon that officer, who likewise notifies new members of their election.

The Corresponding Secretary has kept up the duties pertaining to his office, and proper and prompt acknowledgments have been made for donations to the Museum and Library.

The Treasurer merits our thanks and commendation as in previous years, because he

has so pertinaciously, but good-naturedly, followed us with his bills. If we are to live we must pay. By order of the Trustees I was directed to examine the bills of this officer, and his entries for the year; and at a special adjourned meeting on the 3d of January had the pleasure of reporting them correct.

In April the Director of the Museum was appointed by the Trustees to open the rooms of the Academy three days in each week, for the use of members and their friends; to label and arrange the specimens already in the Museum, some of which were in a sad state of neglect, and to classify all the current donations to the Cabinet and Library. For want of room much of the material is boxed up, and cases of the large specimens are on storage in the U. S. Coast Survey building.

The President then summed up the more important additions to the Museum during the year, showing the interest manifested in the collection by friends of the Academy, far and near, on the coast.

On this coast we are so favorably located for collecting the skeletons and specimens of the marine mammals of the northwest Pacific, that he is confident we shall require a unique collection in that department, not only for exhibition, but for study and description.

Lick's Munificent Gifts.

If we were quickened into new life a few years since, we have this year found the headwaters of perpetual youth. The impulse which Agassiz gave by his personal declarations in our behalf has been crystallized by the munificent donation of James Lick, late of Santa Clara, now of the whole world, and of all time! In February, 1873, unexpectedly to us, he unostentatiously presented the Academy with a deed for a lot fronting 80 feet on Market street, and running to a depth of 275 feet. In July, he presented another deed, adding 40 feet adjacent to the former. These deeds were conditional, but we accepted them without reservation, trusting that the conditions could all be fulfilled. Upon consultation with him, he assured me that his sole and only object was to assist the Academy, in the spirit of the deeds; that he had long contemplated such an act, and that our efforts had satisfied him we had vitality and meant to succeed; so that, if the conditions were judged onerous, or would invalidate his intentions, the terms should be changed. This he did, and on the 3d of October he presented me with a new deed to the first mentioned lot, accompanied with very liberal conditions. This deed was legally accepted by the Trustees, and the act unanimously sustained by the Academy. These facts have all been heretofore recounted and understood by you, and are now mentioned solely as matters in our history.

Another Bequest from James Lick.

That James Lick has faith in the objects and success of the Academy, he has proved by another act in connection with his greatest gift to the cause of the highest of the sciences. It is but a few meetings since he permitted me to announce his intention to appropriate large and ample means to erect and endow an astronomical observatory, with the largest telescope of the most exquisite equipment that the skill of American mechanism can produce. To-day he has authorized me to state that the California Academy of Sciences is to be the Trustee of that Observatory. When he undertakes this work he intends that the glass shall be cast and the lenses ground upon the site of the Observatory, not only that the work may be wholly Californian, but because it would be imprudent to incur the risk of transporting across the Continent an object glass so valuable and difficult of replacing. But this is not all: At my request he has permitted me to state, that by his will he has provided ample means for the building and fully equipping of the edifice contemplated and required in his deed of October, and for the purchase of material for the museum. Words of mine fail to convey the gratitude which science owes to such munificence; in his heart and head there is a wealth of love for human nature, and a keen appreciation of the influence of scientific knowledge in humanizing mankind. We can best pay homage to it by indefatigably carrying out the views which he has expressed in his deed—not in the narrowness of technicalities, but in the broadest liberality of expression.

Aspirations of the Academy.

I could here well close the record of our last year's progress and prospects, but as we are gathering strength, and begin to see our way clearly before us, it is incumbent upon us to reaffirm in a few words what are the higher aspirations and objects of this Academy of Sciences; and to define and mark out a broad policy which will be pursued so far as the means obtainable will permit, and the demands and discoveries of science suggest.

The primary aim of such an institution is the promotion of science. This must necessarily be accomplished by the pursuit and development of special study in the various branches of science, and therefore requiring original investigation by specialists in those branches. The discoveries effected by them supply the storehouse of practical and theoretical knowledge for our shops, manufactories, schools, colleges, institute of technology, and universities. To-day these are utilizing the condensed and correlated science of all previous speculators; a century hence their successors will be using all that will have been aggregated to their time.

With this ultimate object of special investigations continually in view, we propose to secure adequately endowed foundations for orig-

inal research in the different ramifications of science, to be carried on by men chosen for their ability and peculiar fitness for such work; that when such an organization is effected, or partially effected, these investigators shall, besides announcing their discoveries in the regular proceedings of the Academy, deliver lectures upon their special lines of research, and make known by experiment and illustrations what they have discovered, the mode of experiment, and the practical application thereof to art, manufacture, commerce, mining and agriculture.

Foundations to be Endowed.

These foundations shall be known by the name of the endower, so that we will have "The — foundation of original research in cosmical physics;" "The — foundation for original research in metallurgy," etc., etc. With such investigators should be associated as learners and assistants of proved capacity and aptness for such duty, the youth of our highest seats of learning and of the humblest shop and cabin. Small endowments should also be made to enable students of limited means to pursue their special studies. In time they fill the places of the older workers, and spread themselves over the earth as collectors in search of new materials in their favorite studies.

The field of research is illimitable, and the channels of investigation numerous enough to suit and gratify the peculiar mental power of all. The present material wealth of the country has developed from the practical application of scientific knowledge, although the relation may not be apparent to the casual or illogical observer. The future wealth and pre-eminence of the country will be under still greater obligations for such knowledge, which is daily unfolding. These fields and methods of research afford the largest inducements for the mental activity of our California youth, and for the leisure of the successful man of business, who has gained competency from steady pursuit of manufacture or trade.

The President then went on to state that a library of reference is absolutely necessary, which, as well as the museum, should be open at all times.

Pending these endowments, the Trustees propose to secure the services of men, eminent in science, to deliver popular science lectures; and the building we are soon to occupy is well adapted for this purpose.

I have the fullest faith in the consummation of our hopes of success in this broad scheme. We have seen millions granted by the wealthy in other countries, and in our own; we have watched the growth of this liberality; and we have tangible proof in the recent munificence of James Lick in our behalf, and of others toward the University of California. It is a subject that might be almost treated by the calculus of probabilities, and the time and amount of such endowment predicted, were not Californians so apt to exceed the most liberal acts and sanguine expectations of all others.

Reports of Officers.

From the report of Secretary Yale it appears that there has been a gratifying increase of membership during the past year. At the close of 1872 the Society numbered 325 members; during the past year 34 life, 98 resident and 12 corresponding members were elected, making the total membership as follows: honorary, 20; life, 59; resident, 251; corresponding, 110. Total, 470. Twenty-four regular meetings have been held during the year, and one special. The average attendance has been 35 members. The Treasurer's report shows a balance on hand of \$4,562.72. The reports of the Librarian and Director of the museum show an improvement in their departments.

Election of Officers.

President, Geo. Davidson (re-elected); Vice-President, John Hewston, Jr. (re-elected); Recording Secretary, Charles G. Yale (re-elected); Corresponding Secretary, R. E. C. Stearns; Treasurer, Elisha Brooke (re-elected); Director of the Museum, H. G. Bloomer (re-elected); Librarian, Dr. H. Behr. Trustees, General D. D. Colton, Col. George D. Gray, Capt. Oliver Eldridge, R. E. Stearns, Thomas P. Madden and Dr. A. B. Stout. Prof. Geo. Davidson, Chas. G. Yale and Elisha Brooke are ex-officio members of the Board of Trustees.

The Emma Mine.

We give on another page of this issue the Nation's condensation of "Paffard's Pamphlet" on the history of the famous Emma mine. It will be found interesting to our mining readers who, however, should swallow some of the statements with a grain of salt, as it is only one side of the story. The fallacy of the salting part of the programme is well treated by Mr. Henry Sewell in a letter to the Salt Lake Tribune, recently published in our column. A severe commentary on the whole business of running down the Emma and stamping it as an American swindle is the fact that only this week ore has been struck worth \$1,000 per ton. It was only last spring that the Emma owners were talking about disincorporating and abandoning the mine, but they have changed their minds.

The "salting" business on a large scale is not followed to any extent, as it is too difficult to perform, and seldom deceives the eyes of experienced men. Perhaps Mr. Paffard's motto of "magna est veritas et praevalabit" will apply to the Emma in a different sense from what he intended. If the new strike in Emma is found to be as valuable as supposed, she will be lauded to the skies and perhaps do more good to the mining interests of Utah than she has ever done harm.

THE MINING AND SCIENTIFIC PRESS has closed its twenty-seventh volume, and the fourteenth year of its existence. The PRESS is the most valuable incentive to enterprise, inasmuch as it sets forth weekly the hidden resources, advantages, mining, scientific, mechanical, etc., of the Pacific States and Territories, besides a large amount of valuable reading matter. As the paper is a specialty in its line it should be filed for reference by every subscriber.—*Tusculum Independent.*

A SILENT DISEASE PUNISHES THE PATENT ONLY; but a vociferous cough or a horrible cold punishes a whole household. HENDY'S

LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.
JOSHUA HENDY, Esq.—Dear Sir:—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ore are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ore can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.
I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaka and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,
Yours respectfully,
JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

BLANKETS VS. CONCENTRATORS.—The Keystone Consolidated Mining Co., located at Amador, Amador county, Cal., have recently taken out the blankets in front of the battery and substituted twenty of Hendy's Concentrators. Sixteen of the Concentrators take the tailings direct from the batteries and the remaining four re-concentrate the pulp from the sixteen. The latest report from the mine is that they do away with the labor of six or seven men who were formerly employed with the buddles and blankets, and in addition the concentrators save about half a ton of sulphurets daily.—(Mining and Scientific Press, Sept. 6th, 1873.)

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (3 Concentrators).....	Grass Valley, Nevada County.
VULTURE CO. (3 Concentrators).....	Prescott, Arizona.
NOY'S & CO'S MILL. (3 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
EL TASTE CO. (3 Concentrators).....	Sonora, Mexico.
ST. LAWRENCE MILL.....	Georgetown, El Dorado Co.
ST. PATRICK MILL.....	Newcastle, Placer Co.
JULIAN MILL.....	Newcastle, Placer Co.
VICTOR MILL.....	Oregon.
KEYSTONE MILL. (22 Concentrators).....	Amador Co.

CAUTION—All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented April 17th, 1866, and May 19th, 1868."

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the said styled

**"Only Reliable Party in the Business
Who Protects His Customers."**

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

BUY BARBER'S BIT BRACE.

N. Seibert's Eureka Lubricators.**THE HIGHEST PREMIUM**

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v25tf

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

SAN FRANCISCO, SATURDAY, JANUARY 17, 1874.

VOLUME XXVIII
Number 3.

Abbe's Bolt Forging Machine.

It has long been a conceded fact, that, in forging bolts, the four or six sides of the head should be acted upon by the forging dies without moving the bolt blank from the position in which it is first held, and that the forging dies should be wider than the bolt head, so as to leave no fins on the corners of the head. The object of the inventor of the herewith illustrated machine has been to produce a tool which should combine these advantages with all the requirements of every class of bolt forging. Four dies are used, and the bolt is held firmly and securely in one position until finished, always, it is claimed, producing a bolt under the head, just the size of the rod, with the sides of the head in parallel lines with the body. All classes of bolts and shapes of head desired are made, especially the fish joint or T-headed bolts, which we are informed, cannot be made on machines where the bolt is turned to receive the action of the forging dies. The production of the apparatus varies, with the size of the bolt to be forged, from eight to sixteen perfect bolts per minute; and changing from one size of bolt to another, or from one shape of head to another, it is stated, requires hardly a moment's time, especially adapting the device to the use of railroad shops.

Among the points of advantage claimed are, first, simplicity; every bolt and joint being dispensed with except those which produce the result of working the four dies, while there are neither gears, came, nor springs about the machine, thus saving to the user both the expense and the time occupied in making necessary repairs. The sliders are all gibbed so that any trifling wear can be readily taken up without removing the slides to put on a thin strip of iron. The sliding surfaces are always running in oil, as they are placed above the water and cinders. The machine is provided with a cupboard for its tools, a new feature in this class of devices.

The holding vise is operated by a handle, A, attached to the cross shaft. On each end of the latter are the arms, having links, B, attached to work the sliding frame, which open the radial arms that carry the holding dies. These holders are backed up by a filing-in piece, adjusted forward by means of the screws. The length of the bolt is gauged from one inch upward by adjusting the end screw. The driving wheel is in operation all the time; the machine only when it is forging the bolt. The long slide carries the bottom die on its lower end. The top slidodie, C, works on the face of the long slide, which is actuated by two levers, D, E, having curved slots, the top die slide having one lever with reserve curve, all working on the same pin. The pin in the upset carrier, F, passes through the curved slots, and as it acts back and forth, moves them in opposite directions. The slide dies have their motion by means of links, G, attached to the upset carrier.

When the bolt blank is placed in the holders and clamped tightly by means of the handle, A, the handle, H, clutches in the driving-wheel with the shaft, the upset carrier advances by means of the connections to upset the iron, the forging dies being all open. As the upset carrier recedes to half-stroke, the slide dies compress the sides of the head, and at extreme end of stroke the top and bottom dies act upon the other two sides of the head, and so continue to do until the bolt is finished, which is done in four revolutions of the driving-wheel.

The manufacturers, Forsaith & Co., Manchester, N. H., are now making two sizes of these machines, one for both large and small bolts, and the other more particularly for the smaller sizes.

BELCHER BULLION.—There were yesterday deposited in the Bank of California 31 bars of bullion, worth \$120,000. During the week just past this company have shipped \$451,500, or at the rate of nearly two millions per month.—*Enterprise*, Jan. 11.

The Lafin & Rand Powder Company.

We take occasion in this issue of the Press, to inform the mining public of the establishment in this city of a new powder agency, thus completing the list of the eastern powder companies represented on this coast. The Lafin and Rand Powder Company is widely known throughout the States west of the Rocky Mountains, for the superiority of its blasting powder. It is better known on our coast as the Smith & Rand Powder Company, which some four or five years since was represented in this market by Messrs. Treadwell & Company. This company is the largest of the powder companies in the United States, and probably in the World. Their works turn out over half a million kegs of powder yearly. They own four mills in the State of New York, one in New Jersey, three in Pennsylvania, one in Maryland, and one in Wisconsin. The Passaic

determined to use it throughout the principal parts of the mine. Mr. Kabath says that the superintendent, Mr. Corey, estimates that he saves \$16 per day with one battery in one shaft, so that a very large saving must follow by introducing it generally in the mines.

The original bill of the Ophir Co. to the Lafin & Rand Co., was \$141.65, and even reducing Mr. Corey's estimate to \$8 per day, the apparatus has more than paid for itself in the two months it has been used. Say 50 working days, makes a saving of \$400.

The main business of the Lafin & Rand Co., is in supplying different engineering operations with material adapted to their wants. The quality of powder required in mining bituminous coals, for instance, is very different from that which most economically removes the hard quartz rock from our gold and silver mines. Moreover the product of one is wanted in as large masses as possible, and the other with the smallest comminution. The working

ABBE'S BOLT FORGING MACHINE.

Mills in New Jersey, now being built, will, when completed, be able to turn out 200,000 kegs of powder annually.

The company make the highest grades of sporting powder, which they claim to be superior to any other. The agent here, Mr. N. J. Kabath, (of the firm of Kabath & Ladd,) 224 Sansome street, informs us that the Russian, Spanish and French Governments had their cartridges filled with powder made by this company after 15 months competitive trial with other American powders. The standard velocity of this powder is said to be kept up at great expense as any lot deficient in this respect are not allowed to go out of the factories.

This company also manufacture Smith's Patent Battery, an electric apparatus for blasting, and have also become agents for Brown's electric fuse. Several of our leading mines have adopted the electric apparatus for blasting, and the agent shows numerous testimonials to its efficiency. The Ophir company having used this apparatus in their prospecting work, have

of a marble quarry for slabs or the same limestone for burning, furnishes another familiar example. So too, a single railway cutting can frequently employ to advantage a different grade of powder in the side hill, in the tunnel and in its "approach." A leading New York journal says that a noted contractor recently discharged, simultaneously, by means of this company's electric apparatus, some 40 different blasts within supporting distance of each other, which contained three different kinds of powder, and on measuring found his profits to be over \$1,500 from the one explosion. The amount of money that can be saved by adapting means to ends in this matter will astonish those who have not investigated this subject. The question of explosives is a very practical one in these days of railroading and mining.

Reductions in cost have been made by this agency in this blasting apparatus; for instance, a battery formerly costing \$110 is now sold by Mr. Kabath for \$80. He not only supplies the different kinds of powder manufactured by the Lafin & Rand Powder Co., but furnishes, electric blasting apparatus, fuses, connecting and leading wires, detonating caps, rubber tubing, etc., for blasting purposes. The company claim for their powder superiority in cleanliness, uniformity of grain and velocity.

Sargent's Land Bill.

Dispatches to the *Call*, dated Washington Jan. 14th, say:—Sargent's bill relating to public lands in the State of California, which was reported from the Mining Committee to-day with an amendment, was recommitted, in order to allow some slight amendments, suggested by the Commissioner of the General Land Office, to be considered. However, it will doubtless pass the Senate substantially as reported to-day. It now provides that public lands in California shall not be excluded as mineral from pre-emption or homestead entry, unless it shall be shown that bona fide mining claims exist thereon, or that the land is necessary for outlet or other mining easements; and the prices of both agricultural and placer mineral lands shall be \$1 20 per acre. Provided, that nothing herein contained shall be so construed as to change the presumption now existing, either by law or department regulations, that lands within railroad grants are mineral in character. The second section, providing for joint entries by two or more settlers on the same legal subdivision, is unchanged. A new section is added, providing that in cases where mining claims are duly located under the mining laws, it shall be lawful for applicants for patents to make application to purchase lands to the extent of the smallest legal subdivision containing said claims, if such application does not conflict with the rights of other parties, and patents shall issue accordingly. The section permitting all proofs and affidavits to be made before an officer authorized to administer oaths is amended so as to require affidavits when taken outside of the land district to be made before the clerk of a court of record.

Sargent's bill, reported from the Senate Mining Committee to-day, supplemental to the Land Act of May 10, 1872, is amended by the Committee so as to make the time one year instead of six months from the date of the passage, within which applicants for patents for mining claims are required to make final proof and payment of their claims that have been already filed, and those which may be filed hereafter; provided in both cases legal notice has been and may be given without the appearance of an adverse claimant.

Purifying Quicksilver.

EDITORS PRESS:—I see by your issue of Jan. 10th, page 27, that you copy from an interior paper an item to the effect that a patent has been obtained for treatment of "mercurial soot." Without any circumlocution or bombast, let me tell you that in Dec. 1867, in Monterey county, I treated 569 lbs. of soot from which the mercury was dripping, as follows: The soot with dripping mercury was placed in an iron cauldron, and set out of doors, where the rain fell on it, and it was frozen over, there being a cover of ice some three inches thick. To decant or disturb the cauldron from its support I considered dangerous, and to break the ice would lose eoot and mercury, I therefore decided to evaporate the frozen water and to accomplish this at the lowest temperature possible kept the mass agitated with a stick; knowing that alkaline matter, lime or ashes, would be advantageous etc., I used the ashes made at the boiler furnace. The result was that a greater portion of the mercury the soot contained, flowed out freely and was put in flasks; while a small portion of eoot, apparently dry and light, was rolled in newspaper on a rude box made of shakes having about six inches on each side, and the paper and box put back in the furnace. The paper package was soon in flames and from it rose a white cloud, with a hissing noise. The shake box was longer in being heated, but soon gave up a similar white cloud, which filled the upper space of the furnace and followed the direction of the draught. The operation was performed in Roach's furnace, where all being made tight, there is no escape, and the contents may be observed from the peep hole, the draft being inwards. I claim no patent, on this; the public are welcome to the information, and I think priority will establish my right of discovery.

JOHN ROACH.

CORRESPONDENCE.

American Mines and English Owners.

The Richmond Consolidated.

EDITORS PRESS:—The silence of your valuable paper regarding the mining interests of this truly important and prosperous section of sageland has been of late so noticeable that it has induced me to drop you a few lines, in relation to the appearance and condition of the mines included in the above incorporation, prefaced by a paragraph or two that may be not devoid of interest to your numerous readers.

The caption of this article certainly would be a suggestive one at any time, but is doubly so at present, owing to the unfavorable opinion entertained of American mines by the capitalists and mining men of London. That the want of confidence in American mining property, existing there at this juncture, is both natural and business-like, nobody that has given the matter the attention necessary, or read the accounts published from time to time in the London and American journals of the nefariousness of practical, professional "mining sharps," will at all deny. The industrious, speculative tendencies of that large class of our floating population which comes under the generic term—"mining sharp"—have done much to disgrace the commonwealth, injure our mining prospects, and reflect discredit upon the American name and character abroad. The mining sharp, however, belongs not exclusively to this country, though it has now to suffer in a more or less degree from the results of his dishonest acts. He is as

Indigenous to Albion's Isle

As he is to the broad lands of this country and flourishes and prospers there fully as well as he does here. This is just and proper. He has a right, I suppose, to practice his peculiar profession in London or elsewhere within the sea-girt isle, and avail himself of the rights and privileges be inherits under its glorious Constitution. We would find no fault with him for this, or question the rights of the class to which he belongs, to pursue whatever course is deemed best to help to fill their purses with, and fleece their own countrymen, did they but confine themselves and their operations to London exclusively. This they do not do, but extend their travels to Nevada and Utah as well, and make common cause with the experts and blacklegs of the same class that are so largely represented in every mining town on the coast. From their knowledge of Englishmen and their acquaintance with the routine of mining business daily transacted in the Stock Boards of London, they are, with the aid of their American confederates, easily enabled to put up stupendous jobs to fleece their own honest countrymen with and practice the most glaring imposition upon their good natured credulity too. These are truths so patent to all that they cannot be gainsaid. The depreciation in value of some of the mines of this State and Utah, stocked in London, have on appreciable bearing upon the foregoing, and for the sake of argument and illustration we will briefly review the causes that have led to their decline.

To most mining men the facts attending and upon which were leased the success of the unconscionable parties who conspired together to effect the sale of the Emma and other declining

Mines in Utah

Are too tolerably well known to be more than glanced at here. With these astounding facts fresh in the minds of the duped Brits, is it any wonder that our mines are languishing for the want of the necessary capital to develop their dormant wealth, or that their confidence in our honesty—when engaged in negotiating mining sales—is at a point indicated by zero? No, it is not. Time and patience, an honest policy and fairer dealings on the part of mining men may, however, help to place it at a higher point in the ascending scale. A reference to two or three of these Utah mines about the productiveness of which such a terrible hubbub was raised at the time or soon after their incorporation in London by the leading conspirators and their well paid, well drilled satellites, will not be amiss. We all of us remember the furor created by the gilded accounts that reached the willing ear of the dear public of London some few months ago—of the inexhaustible resources of the Emma, Flagstaff and Last Chance mines. These accounts were, at the time, borne out too, by the judicious payments of dividends derived from one hypothesized to interested parties ere it was developed and one ere it was elevated to sun-light from its primitive channels. These three companies backed by their fabulous mines rivaling in wealth the hidden caves of Monte Cristo, commenced at once to pay

Monthly Dividends

Of 18 and even 24 per cent. per annum regardless of the strain and heaviness of such frequent disbursements. The Emma first from the too apparent trickery resorted to, to uphold the highly colored romantic reports published of it—and from being too heavily pressed and too largely attacked—yielded to the inevitable consequences that were sure to follow such acts. The Flagstaff and Last Chance companies soon found themselves similarly swamped, and

their condition to-day serves to deter others from parting with their bank notes to plausible, oily-tongued adventurers. There must be something of more solidity and tangibility shown them now to induce them to invest. A London Journal received from a friend in Europe thus sums up the capital loss sustained by the partial failure of these three mines, to bear out the expectations of their purchasers.

	Amt. p'd.	Mkt. Worth.	Depreciation.
Emma	£1,000,000	£175,000	£825,000
Flagstaff	1,000,000	150,000	1,000,000
Last Chance	100,000	65,000	35,000
	£1,400,000	£390,000	£1,000,000

These figures are startlingly truthful and accurate and shades a falling off from the purchase price of a little over 72 per cent. Who will deny that this is not a serious loss in but three enterprises within a short time?

Collapse with Other Mines.

The collapse too, of the Pacific, from which so much was expected swells the above aggregate by some hundreds of thousands more. It has proved to be an almost total failure, and was as barren of results—other than loss—to shareholders, as was the \$450,000 mines of Mineral Hill, now notoriously worthless. Next comes the Pinto property, the Maryland and other mines, sold by a well-known Nevada banker to the "syndicate" that had then incorporated under that name. Their value is I fear, very little to-day, or at least was, some time ago, ere they were merged in the Bayside S. M. Co., of London, whose property in that now nearly defunct district is superintended by John S. Murphy Esq., of this town. This gentleman has been indefatigable in his exertions towards developing these mines since his assumption of their management, and it will be no undeserved compliment paid him too, to say that under his administration business tact, and rare energy as a mining superintendent, they are in a fair way to result in a success not heretofore anticipated.

Prominent Men in the Schemes.

The are many others which have proved fully as worthless as any of the above that were launched in London, under equally notorious circumstances that cannot be mentioned in the space I propose allowing myself. Enough, however, to say—that when an American Minister fully accredited to the Court of St. James, and American Senator, fresh and impeccable from stormy Nevada, could, and did, so far prostitute not only themselves, but made the influence acquired from the exalted positions they held, subservient to their own base ends, in the furtherance of a scheme from which they were and did receive large rewards, and which is to-day denounced as one of the latest swindles of the age—next to Credit Mobilier and the Arizona diamond splurge—enough I say, to say that where such transcendently exalted personages as they were, would not hesitate to do that which they did at the sale of the Emma, it is about time for Englishmen to say, and with reason too, "what can we expect from private individuals, when U. S. Ministers and Senators will be guilty of such dishonorable acts?" The doings of these gentlemen are operating to the disadvantage of the interests of both Utah and Nevada to-day. Other things too, are not forgotten.

An Attempted Swindle.

Apart from the Emma, we have the brilliant gotten up scheme of the Arizona Diamond swindle, the Lake Superior Tin swindle, and the attempted swindle of Messrs. — and others in salting or attempting to salt the Burro mine, of Ralston, New Mexico, preparatory to a sale in London. Samples of ore were produced in England, and assays exhibited too, of ore that never saw the Burro or was in the Burro lode, if such existed, outside of the imaginative brains of its vendors, but was shipped from a quarter entirely remote and different, and made to appear as the Burro ore. Fortunately, however, for the pockets of our English cousins, the trick was discovered in time to save them their contents.

Thus far we've been glancing at the dark back-ground of the picture; now let us look to the bright foreground and see what we will find there to act as an offset to its unredeeming traits. It is gratifying to be able to produce around our object of interest amid so much to condemn—desiring of praise or mention—and the object is the property of the

Richmond Consolidated S. M. Co.,

(Limited) of London, whose name stands at the head of the article. This property at first consisted of the Richmond only. This mine was stocked in the latter city under the Limited Liability Act, passed to regulate the operations of joint stock companies. A similar Act, if passed by the Congress of the United States, or the Legislatures of the States of Nevada and California, if permissible under their Constitution, would go far to check the impositions practiced upon the stockholders of the many mining companies doing business on this Coast. The Richmond Mining Company are now the undisputed owners of the many valuable mines in Eastern Nevada, that are but little inferior to many of the mines on the famous Comstock. They are the Richmond, Tip-top, Lookout and Silver Region mines. Since the late lawsuit with the Eureka Consolidated company, of this place—whose also valuable mines lie contiguous to the above—the company, for greater security, has had them incorporated under and in conformity with the laws of the State of Nevada.

These mines are situated on the north-western and north-eastern slopes of Ruby Hill, and about two and a-half miles due west of Eureka.

They are reached by a good road, lately built by the company to facilitate the transportation of ore to their furnaces at the upper end of our smoke-hedimmed town. There are three of these furnaces in active daily operation, whose united reduction capacity is 150 to 180 tons of ore each twenty-four hours.

The Amount of Bullion

Run from these monsters in the same period is wonderful, and if anything should occur to prevent the regular daily shipments, it accumulates in an equally wonderful manner, and should be seen to be fully appreciated. This bullion will average \$350 to \$375 per ton of 2,000 lbs., and I believe these estimates are rather below than above the true figures.

The Silver Region and Lookout mines are on the north-eastern slope of Ruby Hill. The former embraces 1,500 feet running longitudinally with the range of the hill, and takes in the Lizette tunnel through which they are worked.

The Outside Improvements

Most noticeable to the eyes of the visitor, are the buildings on the southeast of the tunnel covering the hoisting works erected over the vertical shaft—now sunk over 200 feet—through which the company propose in future to work the valuable ground through which it penetrates. It is expected this shaft will cut ore at a depth of 300 feet or more, and this it can hardly fail to do. The intervening space of a couple of hundred feet between shaft and tunnel is devoted to timbers to be used in the mine. These are all hewn and are cut and prepared in proper lengths and sets by three or four men accustomed to the business. The company, however, purpose soon introducing machinery to cut and fit them in sets cheaper and in a more expeditious manner than now. Next are the substantial ore bins at the outer orifice of the tunnel into which it is dumped from the iron cars used to convey it from the apparently inextinguishable chambers below. The ore is run through chutes from these lines into the wagons of Walter B. Hern, who has the contract for hauling it to the furnaces. Lower down the slope of the hill are two comfortable, substantial lodging houses for the company's employes, and close by is an equally comfortable, elegant boarding house. The foreman's office and quarters are also comfortable affairs.

The water used is supplied from a ditch and pipes connecting with the works outside from which the aqueous element is in turn conveyed to a tank at the inner orifice of the tunnel, and a few feet from top of incline, close to which the hoisting engine stands, in its subterranean abode, ever ready to hoist to its level the stuff which produces the glittering metal in such abundance to its lucky owners. The smoke is conducted from this underground furnace through a most costly smoke-stack—indeed, no less than an \$85,000 one—it being the shaft of the Lookout mine.

The Lawsuit That Took Place Between

The Eureka Consolidated and Richmond companies, to determine the ownership to the Lookout, is of too recent an occurrence, and too fresh in the minds of your many readers to need more than a passing mention here. The trial being the most important of the kind ever commenced in Eastern Nevada, lasted from the 10th of May to the 3d of June, 1873. There was most overwhelming evidence produced on the part of the Richmond, as well as an impartial summing up by the Hon. D. C. Kenny presiding Judge of the 6th Judicial District of Nevada; and, notwithstanding these, the jury could not agree, they standing 7 for the latter and 5 for the former, and were discharged after being out sixty hours, thus leaving the litigants at liberty to commence the battle again. This, however, was not done, for J. J. Corrigan, ex-President of the Company, very promptly purchased the property in dispute for the sum of \$85,000, accompanied by a U. S. patent to its entire area, which forever barred all future litigation.

The Lizette Tunnel Under the Mines

Through which the property is worked, has a curved length of something over 600 feet to the new incline. This incline has a depth of 200 feet, run at about an angle of 40° or 42°, and cuts through a portion or the western foot wall midway in its descent to the bottom or northwestern chamber, all the distance through the finest quality of ore. In this bottom chamber, a few feet from bottom of incline and 200 feet from top of the Lizette tunnel, is a winze commenced last month. The writer, on the 26th December last, visited the mine in the company of J. J. Corrigan, Esq., President of the Company, and J. B. Magee, Esq., Superintendent, and found at that time this winze down some 13 or 14 feet in ore. Since then the latter gentleman has informed me, that it has since that date attained a depth of some 60 or 70 feet vertically through ore of a very superior grade to that found so abundantly above, thus proving beyond cavil the continued depth of the lode and the value and permanency of not alone this property, but of the others of the district. Its course appears to be southwest and northeast, and dipping northeast at about an angle of 28° or 30°.

The mine is indeed wonderfully rich in the Amount and Quality of its Ore

Thus far exposed to view, and is, should there be no further developments made, sufficient to run the company's furnaces during the next two years or more. The imagination alone is incapable of grasping at anything like an accurate idea of the thousands and thousands of tons of high

grade ore now in sight, and it certainly would take more capable pen than mine to give anything like even an approximate description of it or of its longitudinal and lateral drifts and crosscuts, or of its vast chambers elegantly and substantially timbered in a manner at once durable and safe, which reflects credit alike on its efficient-experienced foreman, P. Roseter, Esq., and on its courteous, affable, and successful superintendent, J. B. Magee, Esq., mentioned above.

The Management.

This latter gentleman assumed control by appointment nearly one year ago, and the highest and most deserving compliment that can be paid his efficiency and management since the commencement of his administration affairs of the company, is that its interests have been faithfully guarded their minutest details as well as their largest and most important transactions receiving his care, attention and direction. In consequence of his rare administrative abilities, increasing watchfulness and untiring exertions, together with his great experience as a smelter and miner, the interests of the company he represents have been extended and promoted to a degree not known before his appointment. These things are apparent to all. His cause thus far has been very successful indeed, and it is past favor to presume, that should he continue in the company's service, its interests will be greatly benefited and its sphere of action and operations enlarged, which will give a corresponding return to its fortunate shareholders. He has, moreover, endeared himself to all under him, from the accomplished Secretary, Matt. Howell, to the lowest and most humble workman.

As noticed above, the mines are worked under the direction of P. Roseter, Esq. This gentleman is not only an experienced miner and foreman of several years, but a quiet gentleman, too—urbane and courteous in manner and bearing to all with whom he comes in contact. He is an old Comstocker besides, and has been in the service of the Richmond from its incorporation, over two years ago, to the present time. This term alone is sufficient evidence of his worth as a man and of the value of his services and experience to it as foreman. These services are demonstrated in the care and attention devoted to his business, the admirable condition of the mine considered from a working point, the elegance and security of its timbering and the order and neatness and quietness that are such marked features, both in and out of the mine, whose wondrous riches will add to the prosperity and permanency of Eureka and bring a smile of unfeigned satisfaction to its lucky shareholders.

J. D. P.

Eureka, Nevada, Jan. 5th, 1874.

MINERAL RESOURCES OF ARKANSAS.—This State can, without exaggeration, boast of her mineral deposits, especially when we take into consideration the various parts, their general rich quality, and enormous quantity. Here are magnetic, hematite, specular, calcareous, and other varieties of iron ore, lead, zinc and coal, manganese and associate metals, together with marble, gypsum, salt, kaolin, whet and hone stone, slate, limestone, granite, marl, paint, and niter earth. The coal-fields of the State embrace an estimated area of twelve thousand square miles, and in the valley of the Arkansas river, where the most coal mining has been carried on, the beds are from 4 feet to 9 feet in thickness. This coal is similar in structure and appearance to the Cumberland coal of Maryland, and its quality, by analysis, is very similar. It is also an excellent steam and manufacturing coal. The Arkansas river runs for one hundred and fifty miles through this coal formation. The advantages that Arkansas possesses in this respect must shortly enlist the attention of coal mining capitalists of the Eastern States. The hematite iron beds, in some places cover acres of surface, where there is abundance of the best kind of timber for making charcoal and limestone of good quality for flanking purposes. Never-failing, large water-powers also are contiguous to these iron ore deposits.

PROFESSOR AGASSIZ.—The doctors are puzzled to account for the symptoms of the disease by which Agassiz lost his life, and a careful autopsy has been made. The brain and all the vital organs, especially the heart, were examined with great care. The stomach and liver were free from disease; but in the heart were found evidences of the trouble with which the Professor suffered a few years ago. Special attention was paid to the brain, which was found to be very large and heavy, though its exact weight has not yet been determined. Careful examination was made of the base of the brain, and to insure success in this, it will be necessary to allow it time to harden.

STEAM TO AUSTRALIA.—J. C. Merrill & Co., agents for the Australasian and American Steamship Company, report that the steamer Macgregor will arrive in San Francisco on or about the 19th proximo, and sail on Tuesday, the 27th. Clyde-built steamers specially adapted to this line have been built, and will therefore be dispatched on schedule time every twenty-eight days. Annexed are the rates of fare from San Francisco: To Honolulu, first-class, second-class and steerage, \$75, \$50, and \$40, respectively. To Fiji Islands, \$150, \$125 and \$90. To Auckland, \$160, \$135 and \$90. To Sydney, \$200, \$150 and \$100. To Melbourne, \$220, \$160 and \$110.

MECHANICAL PROGRESS.

Type-Setting Machines.

The question is very often asked by publishers, with a strong emphasis on the first word, "Is there a type-setting machine which will economise the labor of the printing office, or save us from some of the inconveniences attendant upon the illness, incompetency, or, as sometimes happens, the natural perversity of type-setters?" We must say that, for our part, we would rather deal with the crookedness of the compositor. No type-setter has yet been invented equal to Nature's own compositor, and none will yet be invented equal to it until the principle upon which inventors proceed in working out the problem is radically changed. We are shown Kastenbein's machine, in the office of the *Christian Union*, and are told it "works admirably;" but we see one man with a pick and another with pincers, helping along the man who plays the machine, while another corrects and takes up the type, and yet another opens the apparatus and shakes up the "supply tubes" or forces open a gate. We find that the distributor does not work with half the rapidity, and is still more complicated. Yet we are told that "the *London Times* uses six of them." That should settle the matter, only it does not; and we feel that even if the *London Times* used fifty of the machines it would make them no better than they are.

The truth is that no machine within the means of the printer has yet been invented which will do the necessary work. No such machine can or will be invented, as we have said, until the principle adopted is radically changed.

Delcambre's Type-setting Machines differ but slightly from those above referred to. These are the only machines we know of in regular use in New York newspaper offices, yet we think that no one could observe the trouble they give, and their rather meager results, and believe that machine type-setting had become a fact. The capacity claimed for the setting machine is but 3,000 or 3,500 an hour. Deduct from that the fact that you must have a still more complicated distributor of half the capacity; that these machines are delicate, valuable, hard to sell, and requiring special operators, and the fact that "the *London Times* uses six like them," is but a meager recommendation.

As in this brief notice, in reply to many questions, we are confining ourselves solely to those machines which are most in use or seem likely to be, we will next consider the Westcott Type-Setter. This is in many respects an important machine. In the first place it does away with a distributor, at best a rather absurd part of a type-setter, for it is hard to expect a machine built to set type, to be able to undo its work to advantage; it is a cheaper machine, less likely than some others to get out of order, and contains more real power for usefulness within itself than any other. It is not likely that it is the last result that inventors will yet arrive at, but it certainly has high claims. It consists of a compact iron semi-cylinder, containing matrices moved with keys. These matrices travel to a reservoir of melted type composition; the type is made, passed through its ganges and cutters and moved to its proper place finished and cold, more quickly than it could be taken from a box.

We have seen this machine work, and find it to be one of the most ingenious, as it is certainly one of the most interesting machines we have ever seen. It is called, after its inventor, "The Westcott Type-Setting Machine," but it must occur to any thoughtful printer that type making is a very nice operation; that the inspector in a foundry must be constantly at work with his glass and his ganges to discover the smallest changes and differences; that type made as described must be subject to flaws, as indeed are all type; that the cutters and ganges must eventually wear out, etc., etc. Yet practice will soon tell us about these things, and it is possible that experience will remedy them. If so, the occupation of the type-founder, except for fancy type, is modified. Meanwhile we are told that the Harpers have ordered so many, and others so many, etc., facts which say little in favor of the machines, but show that they will be so well tried that printers will know soon enough whether they can use them to advantage or not. The machine is apparently not very fast, but it must be borne in mind that there is no distribution to be done.

Lastly, we must say a word for Orrin Brown's machine, which is, we learn, working to advantage at the present time in Boston. It is on book-work, however, and this is an important fact. It is probable indeed that the first available type-setters will be used for this purpose.

If any questions are answered in the above, the whole object of the article is gained, and we may say that few printers need trouble themselves for some time to come about any advantage they hope to derive from type-setting machines, especially if wanted for small offices.—*Newspaper Reporter*.

NEW CAR STARTER.—Amos Whittemore, of Cambridgeport, Mass., has obtained a patent for a device whereby the momentum of the car is made to lift one end of the car in stopping, and the weight so raised is made so to act as to help the car forward in starting.

Temperature Indicator for Petroleum Oils.

Petroleum oils, as is well known, contain various volatile oils, which, in being disengaged in a state of vapor and mixed with atmospheric air, form an explosive mixture that has been the cause of numerous accidents. It is consequently important to ascertain, by a simple method, as quick and as exact as possible, the temperature of ignition. M. Granier has arranged an apparatus for the purpose, which he has exhibited before the Société d'Encouragement.

A small receptacle of a cylindrical form and made of metal, is closed by a movable cover, furnished, in the center, with a circular opening. This vessel is about two-thirds filled with the oil that has to be tested, so that there may be a chamber of air between the surface of the oil and the top of the cover, in which may be received the inflammable gases disengaged by the oil. A tube, soldered to the bottom of the vessel, holds a wick, the extremity of which ends in the middle of the opening of the cover. A thermometer is inserted in the oil to indicate successive and minute changes of temperature.

For the purpose of testing any oil, it is poured into the vessel to the height already stated. The wick absorbing the oil is then lighted, and thus gradually heats that in the vessel. This is hastened by the presence of some fine copper wire, which extends from the burning wick into the oil, thus spreading the heat through it. When the temperature is sufficiently elevated, the vapors are disengaged, and an explosive mixture is produced, which, on catching fire, causes a slight explosion. The temperature is noted at this moment, and the point of ignition thus ascertained.

"Wet the Ropes."

That some things shrink after they have been washed, and that others expand is well known, but the cause of this requires explanation. If we take a new rope, ten feet or more long, and fix one end of it across a beam, and to the other end attach a heavy weight, and so stretch the rope till the weight just rests upon the ground, the weight, if the rope be well saturated with water, will be raised from the ground simply by the shrinking of the rope. The following statement is an illustration of the fact: The Chevalier Fontana undertook to raise an obelisk at Rome. While the stone was suspended in the air, just over the pedestal, the ropes stretched so much by its weight that the base of the obelisk could not reach the pedestal, and the work was about to be given over, when a man among the crowd called out "Wet the ropes!" This advice was followed, and the column was seen gradually to rise to the required height, and was then placed upon the pedestal, where it now stands in front of St. Peter's. The obelisk is now known as erected by Pope Sixtus. In the shrinking of various cloths it should be remembered that they are made up of small cords which contract by moisture, more particularly when wetted for the first time, both in warp and weft, that is, in length and breadth. Paper, with filaments in all directions is forced asunder by the introduction of water among its pores. On this account the wet side will always be the outside of its curl. Wedges of dry wood, driven into clefts of stone, and then well wetted, will rend rocks asunder.—*Ex.*

WATCH SPRING.—Hair-springs, says a writer in the *Victoria Magazine*, are made in the factory, of finest English steel, which comes upon spools like thread. To the naked eye it is as round as a hair, but under the microscope it becomes a flat, steel ribbon. This ribbon is inserted between the jaws of a line gage, and the dial-hand shows its diameter to be two twenty-five hundredths of an inch. A hair plucked from a man's head measures three twenty-five hundredths—one from the head of a little girl at a neighboring bench—two twenty-five hundredths. Actually, however, the finest hair is twice as thick as the steel ribbon, for the hair compresses one-half between the metallic jaws of the gage. A hair-spring weighs one-fiftieth-thousandth of a pound troy. In straight line it is a foot long.

IMPULSE ON THE STEAM GAUGE.—If a steam gauge runs up or down momentarily for a few seconds, it is no proof that the steam pressure has increased or diminished a corresponding amount. The material of which a pressure gauge is made has inertia, and a sudden impulse may drive it beyond the figure indicating the true pressure. It acts like a water column in a tube in which the water by sudden admission from below may be thrown up beyond the true level, but in a few seconds it will come back to the right place. Turning on your steam suddenly may give an impulse to your gauge which drives its indicator beyond the true figure, but it soon settles where it ought to be.—*Lamberton's Gazette*.

THE SPECTROGRAPH.—The name is given to a simple little device for copying drawings, exhibited in the French department of the Vienna Exposition. It consists of a board, near the middle of which is a piece of window-glass fastened at right angles to it by means of two grooved wooden uprights. When placed near a window, with a drawing or copy on the end of the board nearer the window, its reflection in the glass causes it to appear upon a sheet of white on the opposite side of the glass. In this way quite an accurate tracing can be made by one who is no draftsman.

SCIENTIFIC PROGRESS.

Recent Experiments With Diamonds.

Diamonds are rather costly objects to subject to destructive experiments on an extended scale, and not many investigators have been favored with the privilege of doing it. Thanks, however, to the liberality of the proprietor of a large diamond-cutting establishment in Amsterdam, a certain M. von Baumhauer has been permitted to make numerous studies of the behavior of these interesting gems when subjected to high temperature under various conditions, thus adding largely to our knowledge of the diamond's nature and properties.

The combustibility of the diamond in oxygen was demonstrated long ago; what the pure heat upon it has remained a matter of doubt. Some experiments seemed to show that at extremely high temperatures the diamond is slowly converted into coke or graphite, an effect observed especially when the gem is subjected to the energetic action of a powerful galvanic battery. In certain experiments, in which Moren and Schröter raised diamonds to the highest heat of a porcelain furnace, care being taken to prevent contact with air, a slight discoloration of the surface was observed, whether due to heat or imperfect protection against oxygen could not be decided positively. Inclosed is a bit of hard coke, and placed in a plumbago crucible packed with charcoal powder, diamonds operated on by Siemens and Rose withstood, without the least change, the temperature at which cast iron melts. A cut diamond, under similar conditions, subjected to the heat of molten wrought iron for a considerable period of time, was superficially blackened, but otherwise unaffected. By some this experiment has been interpreted as implying the slow conversion of the diamond to graphite at the temperature at which wrought iron melts. It is possible, on the other hand, that the change was due to air in the crucible; indeed probable, in view of the experiments more recently made by M. von Baumhauer.

By an ingenious device, the last named experimenter was able to subject diamonds, surrounded by an atmosphere of dry hydrogen, to a temperature at which both diamond and platinum holder become invisible; but with uncolored diamonds, their transparency and brilliancy were not in the least affected. Heated in contact with air, diamonds were not only blackened, but reduced in weight, showing positive combustion. In oxygen they burned with a vivid incandescence at a temperature below white heat. In a crucible which allowed the combustion to be observed through a sheet of mica, the burning diamond was seen to be surrounded by a white flame, less bright without and tinged with violet on the outer edge. Pure diamonds burned tranquilly, retaining their sharp edges even when so reduced as to be visible with difficulty. Impure specimens snapped and flew.

Burned in an oxyhydrogen flame, capable of melting platinum, diamonds emitted a brilliant light and wasted rapidly, but did not blacken. Heated to a high temperature in an atmosphere of carbonic acid, they were slowly consumed, decomposing the carbonic acid, and combining with its oxygen with loss of weight. Similarly treated in superheated steam, no effect was produced, showing that at white heat the diamond does not decompose water, as might be expected from its affinity for oxygen. In regard to the supposed transformation of the diamond into coke or graphite by means of pure heat, especially by that of a battery of 100 Bunsen elements, M. von Baumhauer is very doubtful. It should not be admitted, he holds, until the effects observed are proved to be not the result of chemical action, produced by foreign matter, or by the transformation of particles of carbon from the charcoal poles to the surface of the diamond.

The effect of heat on colored diamonds is more pronounced, with the exception, perhaps, of gray and yellow gems, which appear to resist such action, the same as the colorless ones. Green diamonds are variously affected. One of a dirty green tint was changed to pale yellow, with a slight increase of its transparency; but its brightness remained the same. Another, so green as to be almost black, likewise retained its brilliancy, but gained in clearness, while its color was changed to violet. A light green gem lost its color entirely, but was otherwise unaffected. Brown diamonds lost most of their color, showing under the microscope a limpid field scattered with black spots. A diamond almost colorless assumed, under the influence of heat (out of contact with air), a deep rose color, which it retained some time when kept in the dark. In the light its color faded, but always returned again with heating. A naturally rose colored diamond reversed the phenomena, losing its hue with heating, and afterwards gradually regaining it.—*Scientific American*.

SCIENCE AS KNOWN TO THE ANCIENTS.—In Egypt mummies have been found with teeth filled with gold, and in Quito a skeleton has been discovered with false teeth secured to the cheek bone by gold wire. In the museum at Naples, among some of the surgical instruments discovered at Pompeii, there is a facsimile of Sims' speculum. In the ruins of Nineveh, Layard found several magnifying glasses.—*Medical Record*.

The Quadrature of the Circle Again.

S. O. C., of Utah, sends as a lengthy communication, mentioning that he has invented a contrivance by which he can practically measure the circumference of a circle to within the thousandth part of an inch, and asks, 1st. If he has not now either solved the grand old problem of the quadrature, or at least made an important step toward its solution? 2d. If it would be advisable to patent his contrivance?

To the first question, we answer that if he understands by the solution of the problem in question the finding of the circumference of a given circle, or of the ratio between the diameter and circumference, the problem has been solved more than two thousand years ago by Archimedes to within a thousandth of an inch for small circles; while Melius, a mathematician of Holland, three hundred years ago, solved it to the same degree of accuracy for circles of a radius equal to the distance of the earth to the sun. Our correspondent must take into consideration that practical measurements can never compare in accuracy with calculation. In the latter we may go as far down as we chose into a millionth and a billionth part of an inch; while Ludolf van Ceulen, also a Hollander, found that in practical measurements hundredths of an inch are the utmost limits, and that peculiar contrivances or microscopes are required to measure a thousandth of an inch. To mention an ordinary case as an example, take 25 inches and try practically how long its seventh part will be, expressed in decimals. You will find that it is a little over $\frac{3}{7}$, or 3.5 inch; and with a great deal of accuracy you may even go so far as to find 3.57 inch. But by calculation alone, dividing 7 into 25, you find easily that it is 3.57142857, which is correct to within one thousand millionth part of an inch. So it is with the circle; calculations have been made giving numbers so correct that if we suppose a circle of which the radius is equal to the distance of the most remote star visible with the best telescope, we may calculate the length of its circumference correctly to within the thickness of the film of a soap-bubble, and even more than that; in fact the accuracy obtained in that respect surpasses all ordinary imagination.

If our correspondent understands by the solution of the problem the finding of a correct ratio between the diameter and the circumference in whole numbers, the problem is insolvable, as no such ratio can exist. That of Archimedes, $\frac{22}{7}$ gives the circumference too large, $\frac{100}{314}$ gives it too small, $\frac{113}{355}$ too large again, $\frac{333021}{103993}$ too small, etc. The notion of some people that ratios in whole numbers must always exist is very erroneous. Elementary geometry gives as many lines which have no common measure. Such, for instance, is the case with the ratio between the side and diagonal of a square, which can never be correctly expressed in whole numbers, nor fractions, nor in any finite decimal fraction, (this fraction being 1.414213, etc.) and looking at the subject in this light, it is surprising that the problem of crossing the square has not become as celebrated as that of squaring the circle. The cause of this, however, is that the nature of this relation ($1/\sqrt{2}$) was known long ago, being a so-called irrational quantity, while the nature of the quantity expressing the circumference of the circle for the diameter = 1 has only in later times been discovered to be an irrational quantity of a higher order beyond the ordinary irrational quantities, and unfit to be expressed by the same, much less by ordinary numbers or fractions.

In regard to the patent on the contrivance of our correspondent, we fear that there will be as little novelty in it as in his solution. It has probably long ago been surpassed by other contrivances made for the purpose of taking correct measurements. But even if new, the great question in taking patents is: Will it pay? And surely this would not pay.—*Manufacturer and Builder*.

ON THE PREPARATION OF CHLORAL HYDRATE.

—This article is made by pressing chlorine gas into alcohol of about 95 degrees, for about 12 to 14 days, until it attains a gravity of 41° B. The product is then purified by mixture with an equal volume of sulphuric acid and distilling, a large amount of hydrochloric acid being thus driven off. The chloral is then itself distilled off, the product is again rectified by distillation, water is added to the distillate and it is set aside to crystallize. As by-product, ethylene and ethylidene chloride are produced, which are purified by fractional distillation, and also used as anesthetics.—*Druggists' Circular*.

POTASSIUM.—Professor Dalbein obtains metallic potassium by a new process which is likely to prove of some commercial value. He first forms sulphide of potassium by treating dissolved sticks of caustic potassa with sulphurated hydrogen, and subsequently evaporating until the mass is solid in cooling. This mass is then mixed with somewhat more than its bulk of iron filings, and subjected to distillation, the product being run off into petroleum.

CEMENT FOR PIPES, ETC.—J. Spillar recommends a mixture of pulverized iron borings, kaolin, and sirupy silicate of soda as a base for fixing on the heads of stills which are required to stand a high temperature. We should judge the same might be found useful in other situations, such as the joints of cast iron furnaces, for instance.

Meetings and Elections.

CONSOLIDATED VIRGINIA M. Co., Jan. 9th.—Edward Barron, President; J. C. Flood, W. S. O'Brien, S. Heydenfeldt, B. F. Sherwood, D. T. Bsgley, Secretary; G. Fair, Superintendent.

PALM CONSOLIDATED M. Co., Jen., 9th.—President, W. H. Allen, Treasurer National Gold Bank and Trust Company; other Directors, Job Seaman, D. E. Buel, C. S. Pillsbury, J. R. Frink; Secretary, W. Angus Knapp. The property lies in San Bernardino county, and consists of some 16,500 feet of ledges, some of which are 40 feet wide.

STATE OF MAINE M. & M. Co., Jan. 13th.—Trustees, C. M. Boyd, John Fsy, W. J. Filley, A. C. Morse and William Faulkner.

CENTRAL S. M. Co., Jan. 12th.—Trustees, B. F. Sharwood, J. C. Flood and Edward Barron.

EMERALD HILL M. Co., Jan. 13th.—Trustees, Pem. B. Horton, Chas. P. Hurley, John A. McGlynn, John M. Johnson, John D. Mintin, n. Henry A. Fox, John B. Oliver, B. D. Murphy and T. W. Calvery.

ver, B. D. Murphy and T. W. Colburn.
SAN FRANCISCO STOCK & EXCHANGE BOARD, Jan. 12th.
--Wm. Burling was re-elected President; Coll Dean,
Vice President; B. H. Coit, re-elected Chairman; Hy.
Schmeidell, re-elected Treasurer; Franklin Lawton,
re-elected Secretary; W. H. L. Barnes, re-elected Counsel-
lor. Messrs. Schmeidell and Lawton have held their
respective positions ever since the organization of the
Board, nearly twelve years since.

New Incorporations.

LEVIATHAN M. Co., Jan. 8th.- Gold Hill, Storey conn-
ty, Nevada. Capital stock; \$10,000,000. Directors -G.
A. Treadwell, J. Bell, W. G. Albion, John Lloyd and J.
J. Robbins.

PALM CONSOLIDATED GOLD M. Co., Jsn. 8th.—Location, San Bernardino county. Directors, J. R. Frink, Wm. H. Allen, Joh M. Seamans, David E. Buel and E. S. Pillsbury. Capital stock, \$5,000,000.

THE IDA ELLMORE M. Co. has filed a certificate of increase of capital stock from \$1,000,000 to \$3,000,000.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mine mentioned.

California.

AMADOR COUNTY.

GLONE.—*Miner*, Jan. 10: The property consists of a location on the Abe Lincoln and Hercules lodes, also of the Worden company on the Esmeralda lode. A double track tunnel 6½ ft by 6½ is run into the mountain is a southerly conrse a distance of about 1,000 ft. with a side drift called the east tunnel, 300 ft. long, and a south drift 180 or 200 ft. in length, and a second south tunnel of 200 ft. At a distance of about 300 ft. a large vein was cut into, which was denominated the Abe Lincoln, hnt which was the Hercules with the former united into one massive ledge. At a point where the combining of a body of argenteiferous copper made its spessance, a winze was sunk a few feet by hand, when there was such decided improvement manifest that hoisting apparatus was obtained and an effort made to go down by sid of steam hoisting and pumping machinery.

COAL.—*Ledger*, Jan 10: Prospecting for coal in Jackson valley is progressing steadily, and new discoveries have been made. Work on the Luncha Plana mine has only been prosecuted to a limited extent for some time past. The last work developed a considerable increase in the main vein, and as the works are driven in the coal becomes heavier and of superior quality. The owners intend running an incline to the vein from the north side of the hill, thus rendering their mine easier of access. Recent work on the mine near Ione City has developed a heavy body of coal of excellent quality.

ONEIDA.—*Sutter Creek Independent*, Jan. 6: The newly-discovered body of rock in the lower level of the Oneida is being opened up as rapidly as possible. The ledge is now increased to a width of 5 or 6 ft. The rock is believed to be of a richer quality than heretofore discovered.

CALAVERAS COUNTY.

Good YIELD.—*Chronicle*, Jan. 10th: From the Monte Christo mine at Mosquito Gulch 60 tons of quartz yielded 95½ ounces of gold—an average of \$36 per ton. The rock was crushed in Garland's new mill at Mosquito. The Monte Christo is owned by Messrs Albright, Rechenbach & Co. The rock recently crushed was taken from a depth of about 120 feet from the surface. The ledge varies from 1 to 3 feet in width, the rock all containing gold.

BLUE MOUNTAIN.—Late intelligence from Blue Mountain is flattering in the extreme. Rich quartz has been struck in the bottom of the shaft in the Heckeendorn, and the number of hands employed has been increased. The officers of the company have in contemplation the addition of more stamps, and will enlarge the working capacity of the mine in other respects. Other mines in the district are also showing well, and work is being vigorously pushed.

HAULING ROCK.—Hauling the quartz recently taken from the upper tunnel of the San Bruno mine at Mosquito to Garland's mill has been commenced. There are about 100 tons in all.

MINERAL PATENT.—The Watson Bros. placer mining claim, consisting of 110 acres, located in Township 4 North, Range 11 East, this county, has been sold to Abram Shear.

GARLAND'S MILL.—Garland's new mill at Mosquito has lately been furnished with self-feeders, appliances that save a great deal of trouble, and add to the milling capacity of the battery. Everything works to a charm.

DITCH BROKEN.—The water ditch broke Wednesday, at Cspe Horn, near Rich Gulch Flat. About 20 feet in length of the lower embankment of the ditch, which at that point runs along an exceedingly steep declivity, slid out, cutting off the water supply entirely. A large

Our Weekly Stock Review

THURSDAY, Jan. 15, 1873.

During the past week there has been a heavy decline in the nominal value of mines on the Stock Board, notwithstanding the favorable reports from almost all localities. The market has been in such a feverish state of excitement for some time past and prices have ruled so high, that the sudden decline was not unexpected. On Friday last Ophir, which in the week previous was up to \$315, began to fall and went down to \$143. There seems to have been no cause for the break except the very natural reaction after the unusually high prices. Probably the most natural reason for the fall in Ophir was that the ring who control it were unloading while prices were high. Nearly all the stocks begin to fall and California street was in as much of a state of excitement as when prices were going up.

On Monday the market showed signs of more strength, and stocks were active at an advance in price. The new California stock was put on the market and was in demand at \$40. The Central and Central No. 2, which are absorbed in the California, disappear from the list, and Consolidated Virginia sold at \$78, the stock dividend off, equal to \$101 with the dividend.

On Tuesday the market was again quiet, with weak prices. At the close prices were generally lower. Ophir fell \$15; Gould & Curry, \$4; Best & Belcher, \$5; Savage, \$13; Chollar, \$9; Crown Point, \$7; Yellow Jacket, \$7; Belcher, \$6; Consolidated Virginia, \$1; Segregated Belcher, \$25; Overman, \$11; California, \$1. Alpha was \$6 higher; Confidence, \$1; Empire Mill. \$1 and Hale & Norcross, \$2.

dividend for 1874, of \$3 prr share, on
\$300 000.

The Superintendent of Ophir writes as follows under date of Jan. 10: "Cross-ents on 1,300-foot level continue to improve in appearance. Work was resumed this morning on the 1,465-foot level. On the 1,700-foot level work is suspended until the new engine can be lowered and put in place."

The Consolidated Virginia mine has shipped on this month's account twelve bars, valued at \$34,647.

The Chollar mine turned out 592 tons of ore last week; sent to mill 530 tons, and has on hand at mill 7,900. The ore mined averages per assay \$27 per ton.

By referring to our Stock Tables the several declines from prices of last week will be seen. The advances are few and slight. The dullness general and pretty heavy. Prominent among these declines are Alpha Con. \$12; Best & Belcher, \$7; Bullion, \$14; Central, \$25; Central No. 2, \$6; Chollar, \$19; Crown Point, \$17; Gould & Curry, \$2; Ophir, 70; Overman, \$14; Savage, \$32; Segregated Belcher, \$15; Yellow Jacket, \$39. This is in the Washoe minee alone. Belmont stock, so much in request of late, fell \$9, and Raymond & Ely fell \$4.

FROM PANIMENT.—R. P. Stevens, an old Pioche miner has but recently returned from the Paniment mines in the Telescope mountains, on the west side of Death valley, about 70 miles east of Owens lake. There were only about 30 men at the mines when Stevens left, about two month ago. He says R. P. Stewart, of Havilah, has sold his interests for \$30,000. The formation of the country is limestone, and some of the ledges show for a mile and a half or more, while a larger number can be traced on the surface 400 or 500 yards. As he saw no chance for prospecting he does not think of returning.—*Pioche Record.*

force of workmen was immediately dispatched to the scene of the "break," and the damages repaired as speedily as practicable.

SLUCINO OUT.—The Water Company's big reservoir on Negro Hill is being sluiced out again. The sediment brought down in the ditch from mining claims higher in the mountains accumulates so rapidly as to necessitate the cleaning out of this reservoir once in two or three years. Work is prosecuted day and night, a large head of water, under a heavy pressure, being employed in hydraulizing off the "slam." Mr. S. L. Prindle, Superintendent, informs us that the cleansing of the reservoir will probably be discontinued, shortly, until another rainfall sets in.

SHEEP RANCH MINE.—Messrs. Ferguson & Wallace continue to work their quartz mine at the Sheep Ranch with unprecedented success. The net proceeds from their 5-stamp battery exceed \$200 per day. The condition of their mine is excellent, and its wealth already developed marvelous.

EL DORADO COUNTY.

BREWSTER AND SHEPARD LEDGE.—*Democrat*, Jan. 10: Last Wednesday morning we paid another visit to the above-named recently developed ledge, which is located not a quarter of a mile from the center of our city. On the occasion of our former visit the crest of the ledge was being uncovered, which was found at a depth of 3 to 10 ft. below the surface of the ground, the ledge being what is called a "blind" one—that is, having no surface croppings. It was thus followed, uncovering and stripping to a depth of a few feet, for a distance of over 200 ft. across the point, running nearly due north and south, along the whole distance showing surprising uniformity in size of ledge, character of ore and in the dissemination of gold throughout it. When we were over there on Wednesday we found that the stripping had been continued sufficiently to demonstrate the permanent character and increasing size of the ledge. A tunnel has been commenced about half way down the hill and driven in about 45 or 50 ft., a road commenced from the mouth of the tunnel to the Shepard mill, and about 20 tons of fine ore sacked ready for transportation thereto. Much of the ore taken out during the past week, including some which we personally dug out of the back of the tunnel on Wednesday, can be safely reckoned on for \$1 per lb. As this seems to be the era of big bare, the calculation of Messrs. Brewster and Shepard is to immediately take out and mill not less than 100 tons of average ore, the product of which they propose to run into a bar, to show people what can be done on a ledge in the heart of the city of Placerville which is undoubtedly but a spin of the mammoth ledge not more than forty feet west of it on the surface, which has been traveled over for twenty-five years by thousands of prospectors who little suspected what wealth they were treading on.

STARTER UP.—Operations were re-commenced at the St. Lawrence mine last Monday, after an interval of about a month, during which time they have been shut down, making improvements in machinery and re-timbering portions of the shaft from the 600 ft. level, where the ledge shows larger and richer than ever before, and the mill is now at work on first class ore.

NASHVILLE AND LATROBE.—*Cor. Democrat*, Jan. 10: The old Fort Yuma mine, which is located in Agra mining district, west of Nashville, is again the scene of busy operations. They have recently put up new hoisting machinery and other improvements. The Fort Yuma is now under the superintendency of Sam Lane, an energetic miner and shrewd manager, and the mine bids fair to become highly productive. The ledge or vein is from 3 to 4 ft. wide, with well defined wall, and a large proportion of the rock will average fully \$40 per ton by common mill process. This ledge has been prospected to a depth of 125 ft., with a drift running south 50 ft. from the shaft. Several hundred tons of high grade ore on the dump and in sight, and just as soon as the weather will permit the proprietors will commence erecting a ten stamp mill.

The Lady Emma mine, in Agra district, near Latrobe, Isaac Taber, Superintendent, is putting machinery in running order and will commence work on the 1st of February. There is a 200 ft. shaft in the Lady Emma, with well defined walls, a widening vein and ore that prospects well.

Our correspondent thinks that "with a little more capital judiciously managed, Old El Dorado would set the world agog with her wonderful production of precious metals."

INYO COUNTY.

TO START UP.—*Independent*, Jan. 3d: Belshaws furnace is to start up to-day after quite a resting spell, during which it has been thoroughly overhauled. The others are in full blast.

KERN COUNTY.

Havilah Miner. Edward Henry has made a valuable discovery a few hundred yards below the McKendree mine. Last week, while running a tunnel to a certain lead, he accidentally ran into a very large blind vein of quartz, rich in sulphurets and free gold, and it is the presumption of mining experts that this is the mother of all the leads in the Havilah district. The lead measures 14 ft. from wall to wall. On the hanging wall it has a clay gouge of 4 1/2 ft., and the gouge on the foot wall is 8 inches, which leaves nine feet of the finest character of gold-bearing quartz. This lead shows big

prospects in the horn spoon. The line of the McKendree tunnel as surveyed, crosses nine cropping ledges. The number of blind ledges is unknown, but the presumption is that the mountains are full of ledges that have been covered up by surface ground or decomposed rock.

JOE WALKER MINE.—The new boilers have been started up, and are furnishing plenty of steam to the pumps, which are only 50 ft. from the bottom of the mine. The mine will be entirely cleared inside of a week.

NEVADA COUNTY.

HARVEY MINE.—*Grass Valley Union*, Jan. 9: This is a new mine, located on Clark's ranch, near the North Star mine. But little work has yet been done, but a most splendid showing of richness has been made. The ledge is about 5 ft. in thickness; a portion of it, say 2 ft. in thickness, is of quartz somewhat decomposed. In the decomposed mass are lumps of very rich rock. We saw a fine specimen from the Harvey about the size of an ordinary fist with free gold all through. There were cavities in the lump and they were lined with the brightest and most beautiful gold. The Harvey is showing well.

MAIN STREET is improving very rapidly with the macadamizing process used on it. There are a number of amateur stone breakers who take hold of a hammer and pound up the stone. Yesterday we saw a man who pounded up a piece of stone and who picked up a gold specimen from the rock he had broken. We advise all the idlers in town to break rock so as to find gold.

PLACER COUNTY.

OTA QUARRIES.—*Herald*, Jan. 10: The granite quarries of California are surpassed by none in the world, and those quarries lie principally in Placer county. The granite for the State Capitol was taken from Placer county; the granite for the Government Mint was taken from Placer county; and just now the State quarry and Quinn's quarry, at Rocklin, are engaged in filling a very large contract for the dry-dock at Vallejo. Besides these two quarries, which are at Rocklin, there are the Taylor quarry at the same place; Griffith's quarry at Penryn, and a large quarry at Pino, formerly, and we believe yet, owned by Quinn, of Rocklin. These quarries regularly employ about 200 men, and just now there is a demand for more help than can readily be obtained. The quarries at Rocklin have the contract for furnishing the granite for the Vallejo dry-dock, which will necessarily bring a great many laborers to the place, and consequently make times good for that town for some time to come at least.

SIERRA COUNTY.

AT WORK.—*Mountain Miner*, Jan. 10: Col. Baker has got water in, and the pipes are working his claim at Gardner's Point, above Port Wine. He has not a full head, of course, but enough to make a start.

BALD MOUNTAIN.—The Bald Mountain Co. have been washing out gold by the hundred ounces since water came.

ARASTMA.—Mr. Smith, of Sierra City, has invented and taken steps to secure a patent thereon, a machine for grinding quartz. When in operation one of them will reduce more quartz in a day, and grind it finer, than all the arastmas in Reis' Ravine. It works on the principle of the miller, formerly used by painters to grind paint. It is the intention to erect one in the spring.

FOREST CITY MINE.—*G. V. Union*, Jan. 9: We learn that the Bald Mountain Co., of Forest City, Sierra Co., has made a champion clean up. After drifting out gravel for 13 days and washing 8 days the Co. cleaned up 11,000 ounces of gold. The gold there is worth \$18 an ounce, which gives only \$198,000 for the little run. Yet years ago they said that Bald Mountain was worked out.

TUOLUMNE COUNTY.

GOLDEN GATE MILL.—*Independent*, Jan. 10th: The mill on the Golden Gate quartz mine started up for crushing for the first time at 10 o'clock on the 7th inst.

PATTERSON MINE.—From workmen engaged on the Patterson mine, at Tiptletown, we understand they have struck it very rich, but to what extent we did not learn.

RAYMOND'S CEMENT CLAIM.—At Sonlsby, they are taking out cement-gravel, which will be crushed in the Lander mill. They have just finished fixing up the mill, and a party is now fixing the road from the mine to the mill.

SOULSBY MINE.—In the south shaft, where the recent fire occurred, everything is now in working order, and the contract is let for sinking the shaft deeper. There is some fine looking rock in this shaft. The pumping gear in the Davidson shaft is in good running order. There are two 8-inch force pumps in this shaft, which is down about 500 feet. The level at this depth on the vein, is going through good pay rock. The new mill with all the latest improvements, will be erected on the old mill-site, in the spring. From 25 to 30 men are now employed in and about the mine, which force will be largely increased in the spring, when operations commence on the mill.

RICHES TRAM EVER.—*Democrat*, Jan. 10th: On Wednesday, at a depth of 150 ft. in the Patterson mine at Tiptletown, richer ore than any before taken out was found. Since the present company owned this property it has been successfully worked at a handsome profit.

TRINITY COUNTY.

SLUCINO.—*Journal*: Sluicing has commenced, but the supply of water is limited, the cold nights holding it back. Miners, however, are happy in the knowledge that the ground is thoroughly soaked and there is a great depth of solid snow on the mountains.

More capitalists were here this week looking at the McGillivray mine. No sales have yet been made.

THE RIVENSINK, formerly Telegraph mine, is 5 miles from Italian bar and about three-fourths of a mile above the U. S. Grant mine.

In 1860 this mine was worked successfully by Martin, Kils, Isaac Wright and others, until they sold out to other parties whose labors were not so remunerative, owing to the loss of gold in milling, and the large amount of waste rock put through before a second chute was discovered. By running a tunnel along the vein, by other parties, and leaving the waste rock unworked, good body of ore has been found; also in the old chute upon sinking, it is found to pay as rich as ever. Mr. Casserly has transferred all his right in the mine to Messrs. J. L. Murphy & Co., who will make things lively about this mine in the spring.

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—*Record*, Jan. 4: No. 3 shaft 118 ft. below the 10th station; will start a drift off from the 11th station the latter part of the week. The west drift on the 10th station is in 93 ft. and looks very promising indeed. The east drift on the 9th station is in 414 ft. The east drift on the 8th station is in 428 ft. A winze has been sunk from that drift down to the vein, and is down 64 ft. The east drift on the 520-ft level is in 353 ft. and in about 40 ft. further expect to intersect the body of ore being worked from the 620-ft. level. Summit shaft down 890 ft. Work is progressing satisfactorily throughout the mine. Ore dump full, not having been able to clear it on account of the bad roads.

WASHINGTON AND CREOLE.—Shipped for December \$33,191.58 in bullion. Now sinking the western prospect winze, ore continuing the same. Also raising over both winzes in ore. The want of air for the present prevents further work being done. The Mazeppa shaft, now belonging to the Washington & Creole Co., has been sunk and timbered 100 ft. A contract has been let to sink the shaft 100 ft. further. The number of men employed is 65. Will commence shipping ore again about the 15th inst.

NEWARK.—A specimen taken from the Newark weighs 46 lbs., and will assay but little below \$1,000 to the ton. The dump begins to make a respectable showing of ore. Considering that there has been no stopping done, this presents the mine in a very favorable aspect. The force at work has been increased somewhat during the week.

AMERICAN FLAG.—Shaft now down 900 ft., and will commence putting in the 9th station immediately. Drifting will commence from this shaft to-day to cut the vein. The mill has just got through with ore from the American Flag mine. The dry kiln is undergoing repairs which it will take about ten days to complete.

PISCHE.—Now down 466 ft., and sinking rapidly. It is the purpose of the managers to continue sinking until a depth of 1,000 feet is made. The hoisting works over the new shaft operate entirely satisfactorily. The mine generally looks favorably.

PORTLAND.—Pushing the drift rapidly.

ALPS.—Started a new drift east, from which ore is being taken. The drift south continues in country rock, with indications of cutting the vein soon.

PEAVINE.—Connection has been made with the new shaft, from which ore is being taken. The mine throughout looks promising.

SILVER PEAK.—Incline now down 430 ft., and at this point the ledge is widening and the ore improving in quality.

CAROLINE.—The past week sunk about 25 ft., and sinking continues.

WASHOE DISTRICT.

OPHIE.—*Gold Hill News*, Jan. 10: The cross-cuts made from the main south drift of the 1,300-ft. level have developed the fact that a large body of rich pay ore lies at that point, extending from the first, or north cross-cut, probably to the north line of the old Central, over 300 ft. At the 1,465-ft. level the south drift was carried to within about 40 ft. of the Central line, passing through low grade ore till the last 30 or 40 ft., which was in high grade ore. Being within three or four days of the annual election for trustees, it was deemed expedient to stop work in this direction; therefore the drift was turned at a right angle, in order to get out of it, but after running this drift about 100 ft., it terminated in high grade ore, and finding it impossible to keep out of good ore, work was ordered stopped. The consequence was a sudden drop in the stock, yet nothing is the matter with the mine.

OVERMAN.—Development of a fine body in a winze from the 1,000-ft. level to connect with the main west drift on the 1,200-ft. level has given renewed life. Enough is known to warrant the belief that when the drift on the 1,200-ft. level cuts the ledge, a good pay mine will be developed. As soon as the new air compressor arrives, a small engine, to be driven by compressed air, will be placed at the mouth of the winze on the 1,000-ft. level, to do the hoisting and facilitate the sinking and prospecting.

BELCHER.—Daily yield, 500 tons, extracted from the 1,000, 1,200 and 1,300-ft. levels. A

connection has been made between the drift running north from the shaft and the drift south from the Crown Point on the 1,300-ft. level, giving a good supply of pure air. The 1,400-ft. station has been driven ahead from the inches 12 ft. The new winze, being run from the 1,300 to the 1,400, is down 43 ft. Will commence by extracting ore from the 1,400-ft. level in about 10 days. The mills are all running up to their full capacity.

DATON.—Daily yield 50 tons, the assaying \$40 per ton. This is mostly extracted from the south stopes on the 2d level, and is being shipped to the Weedward mill. The first shipment, consisting of 80 tons that gives average assays of over \$500, was made yesterday to the Auburn mill for the purpose of getting a true working test. The ore chute from the 1st to the 2d level is completed and the extraction of ore from that part of the mine commenced. New boilers are being set for the purpose of supplying steam for the new steam pump. Nothing is done at present on the 3d level on account of a heavy flow of water.

YELLOW JACKET.—Sinking the main incline is still making good progress. Considerable water encountered in the incline during the week. On the 1,500 ft. level, the work of drifting and prospecting is carried forward energetically.

JULIA.—The course of the main southwest drift on the 1,000-ft. level has been changed a little to the left to avoid cutting through a heavy body of tough clay. The main southwest drift on the 900 ft. level is still pushed steadily ahead, running parallel with the ledge, occasionally cutting bunches of ore of a fine quality.

ARIZONA, UTAH AND GLOBE.—The main west drift on the 400 ft. level is still driven vigorously ahead, the face in hard blasting ground. The ore in the up raise from the Globe tunnel has opened out 3 ft. thick and of a fine quality.

TYLER.—A heavy flow of water was encountered in the main west drift on the 200 ft. level on Thursday, stopping all work in the drift. It is expected that the water will be drained in a very short time.

FAIRMOUNT.—Main tunnel cleaned out and repaired into and through the ledge. The ledge at this point is 18 ft. in width, nearly all ore, that assays from \$15 to \$22 per ton. A drift north from the main tunnel has been started, following the line of the ledge and intended to connect with the old shaft at a depth of 170 ft. from the surface.

GOULD & CURRY.—On the 1,500-ft. level the northeast drift is still in the soft formation. On the 1,600-ft. level the east drift is now in hard blasting ground. The east drift on the 1,700-ft. or lowest level is in ground of a soft nature.

THE AUBURN MILL.—As will be seen by an advertisement in another column, the well known Auburn mill at Reno, has again started up, under the management of E. N. Riotte, J. L. Beyea and S. O. Brown. This mill has been idle for a long time but is now well prepared to do reliable work at favorable rates. No charges are made for sampling or reduction. The *Reno Journal*, speaking of this mill, says:

The company have considerable ore on hand, which has been sent them from San Francisco, from Oreana, from Winnemucca, from Salt Lake City and from Virginia City. As is well known, this extensive mill, with its various adjuncts, is to be employed principally in the reduction of rebellious ores, and is the one in which the famous Stetefeldt furnace was first successfully operated on a large scale, and its value as a chloridizing agent fully established; so that to-day, notwithstanding the numerous experiments made with a view to accomplish the same results, the Stetefeldt furnace stands unopposed by any other, as the most expeditious, safe and reliable in use. E. N. Riotte, J. L. Beyea and S. O. Brown compose the company now running the mill, and under their regime we confidently expect to see the mill as popular as ever, and mine owners show their faith in its efficiency.

SMEETING IN SACRAMENTO.—A number of gentlemen propose establishing smelting works in Sacramento, and to further that object a meeting was held on this week of those interested, when various plans were discussed. It is probable that a company will be incorporated for the purpose. About \$6,000 was subscribed among those present, and a committee appointed to solicit further subscriptions.

MINERS' UNION ELECTION.—The Virginia Enterprise gives the following list of officers of the Virginia Miners' Union elected on the 9th inst.: President, James Dockery; Vice-President, O. B. Delany; Recording Secretary, Frank Murphy; Financial Secretary, A. Mott; Treasurer, Denis Nevin; Warden, A. Dey; Conductor, C. B. Gates.

STOCKEEN RIVER MINES.—In Portland, Oregon, the Stickeen gold mine fever shows no abatement, and a rush is expected as soon as the weather settles. It is reported that a well-known gentleman of that city has purchased the steamer *Shoo Fly*, and will immediately commence building another of light draught for use on the Stickeen River.

New Society of Engineers.

DEEP MINES.—The Gould & Curry, Savage, Hale & Norcross and Imperial mines are all down to the Sutro Tunnel level, and exploring at that point. The Yellow Jacket is considerably below it, and the Crown Point has penetrated 200 feet below it.

GOOD HEALTH.

Physical Education.

Perhaps not the least advantage which is derived from muscular, active exercise, as opposed to passive exercise,—by which we refer to a ride in a carriage, or a sail in a vessel, in which latter case the abdominal muscles are the only ones actively exercised—is cleanliness. We mention this, as it has been little insisted on by the advocates of gymnastic training. It belongs rather, perhaps, to a treatise on medicinal than on athletic gymnastics; but the two are at the present day, as we have said, happily incorporated. A microscope will show the millions of drains with which the skin is perforated, for the sake of voiding effete matter. This effete matter can only be thrown off by perspiration, produced by exercise. If it is not thrown off, it is absorbed into the system, and diseases, particularly consumption, and premature death, are the result. The result is produced by the canals of the skin becoming clogged, which not only prevents the refuse matter from coming out, but also prevents oxygen, which is essential to life, from coming in.

We do not breathe with the lungs only, consuming carbon and other matter, and renewing the blood with oxygen as it passes through them. The skin also is a respiratory organ; some animals have no lungs, and breathe entirely with the skin; others with a portion of the skin modified into gills, or rudimentary lungs. In animals of a higher grade, through the lungs are the instruments principally devoted to this function, the skin retains it still to such an extent that to interfere with its pores is highly dangerous; but to arrest their operation, fatal. The breathing of the skin may be easily proved by the simple experiment of placing the hand in a basin of cold water, when it will be soon covered by minute bubbles of carbonic acid. But a more complete and scientific proof is afforded by inserting it in a vessel of oxygen, when the gas will, after a short interval of time, be replaced by carbonic acid. "We all know," says Dr. Breerton, "from daily experience, the intimate sympathy which exists between the skin and lungs, and when we are walking fast, how much more easily we get along after having broken out into a perspiration; if we are riding, our horse freshens up under the same conditions." In these homely words he is indirectly proving the chief sanitary characteristic of medicinal gymnastics.

We have most of us heard of the story of the unfortunate child who, to add solemnity and symbolic happiness to the inauguration of Leo X. as Pope of Rome, was gilded over at Florence, to represent the Golden Age. The career of that child so conditioned was brilliant, but brief. It, of course, died in a few hours. One of the reasons of the greater danger of extensive burns or scalds compared with others, smaller though deeper, is the fact that the former exclude a greater surface of skin from the oxygen of the air. M. Fourcault, a distinguished French physiologist, whose admiration of science appears to have led him to care little for the infliction of torture on other animals than himself, sacrificed a great number of Guinea pigs, rabbits and cats, by varnishing over the whole of their skin, contemplating with satisfaction the inevitable result—death—as a demonstrative proof that the skin breathes. One word more. It has been imagined that gymnastic exercise is exclusively profitable to the young. It is not so; it is of advantage, of great advantage, likewise to the old. Young persons—we include, of course, women, and wish that calisthenics, which we suppose to be a species of female gymnastics, were more systematized and popular—need little exhortation to exercise, since, by nature, motion is their chief desire; but they stand in need of advice and moderation, since, as they do everything immoderately, so they are accustomed to take too much exercise, and of an improper character, a course of proceedings not without danger. On the contrary, with older men, the increasing weight of the body, and the loss of the so-called "animal spirits," induces the desire of repose, and they need an increase of exercise beyond that which inclination enjoins on them. Thus they are brought within the province of the gymnastic code.—*Cornhill Magazine.*

NEW REMEDIES FOR CHOLERA.—French physicians, as a rule, hold to the fungoid theory of cholera, and one of their number has been experimenting with the carbolate of ammonia in cases of cholera, so far, we learn, with encouraging success. One physician (Dr. Déclat), looks upon carbolic acid as a prophylactic, to be used in the ordinary way of diet during epidemics. It is taken in the form of syrup. When a patient is attacked with cholera, the syrup should be administered, and a dilute solution of the acid injected. In severe cases, the doctor employs a syrup of carbolate of ammonia, with subcutaneous injections of the same; and he is so confident as to the efficacy of his remedy that, in cases where dissolution is impending, he injects a solution of the carbolate of ammonia directly into the veins.

ELECTRICITY AND YELLOW FEVER.—A correspondent writing from Fayette, Mississippi, to the *Scientific American*, says, that prior to the breaking out of the fever, and during the prevalence of the epidemic, the rains are unaccompanied by lightning and thunder, which in

other seasons are common. There was only one peal of thunder heard in his county between the middle of September and the latter part of October. In 1855, at a school celebration, a sufficient amount of electricity could not be generated to perform the simplest experiment with the electrical apparatus, and shortly thereafter the yellow fever broke out and raged terribly.

GLYCERINE AND CASTOR OIL.—The *Philadelphia Medical Times* has an article on this subject. It is stated that if castor-oil be mixed with an equal part of glycerine and one or two drops of oil of cinnamon to the dose, it can scarcely be recognized. The writer affirms that he has used this mixture a great number of times, and can confirm all that has been said of it. Children take it out of the spoon without difficulty, and it has been given to doctors without their discovering that they were taking castor-oil. This hint may be well worth acting upon, considering the nauseous character of castor-oil to most persons.

NUTRITIVE PROPERTIES OF APPLES.—It is stated that by a careful analysis it has been found that apples contain a larger amount of phosphorus, or brain food, than any other fruit or vegetable, and on this account they are very important to sedentary men who work their brains rather than their muscles. They also contain the acids which are needed especially for sedentary men, the action of whose liver is sluggish, to eliminate effete matters, which, if retained in the system, produce inaction of the brain, and indeed of the whole system, causing jaundice, sleepiness, scurvy, and troublesome diseases of the skin.

Useful Information.

Wax Flower Making.

The best white wax is required for the art—pure, and free from granulation. The consistency may need to be modified, according to the state of the weather, and the part of the flower to be imitated; it may be made firmer and more translucent by the addition of a little spermaceti, while Venice turpentine will give it ductility. In preparing the wax for use, it is melted with Canada balsam, or some kind of fine turpentine, and poured into flat tin moulds; these give it the form of quadrangular blocks or slabs about an inch thick. These blocks are cut into thin sheets or films, in one or other of several different ways—by fixing them down flat, with a screw and a stop, and slicing off layers with a kind of a spoke-shave; or holding a block in the hand, and passing it along a carpenter's plane, having the face uppermost; or causing the block to rise gradually over the edge of the mould, and cutting off successive slices with a smooth-edged knife.

The coloring of the wax is an important matter, seeing that in some instances the tint must penetrate the whole substance; whereas in others it is better when laid on the surface as a kind of paint. The choice of colors is nearly the same as for other kinds of artificial flowers, but not in all instances. The white colors are produced by white lead, silver white and one or two other kinds; for red, vermilion, minium, lake and carmine; for rose color, carmine, following an application of dead white (to avert yellowish tints); for blue, ultramarine, cobalt, indigo, and Prussian blue; for yellow, chrome yellow, massicot, Naples yellow, orpiment, yellow ochre, and gamboge; for green, verdigris, Schweinfurth green, arsenic green, (the less of this the better), and various mixtures of blue and yellow. For violet, salmon, flesh, copper, lilac, and numerous intermediate tints, various mixtures of some or other of the colors already named. Most of these coloring substances are employed in the form of powder, worked up on a muller and stone with essential oil of citron or lavender, and mixed with the wax in a melted state; the mixture is strained through muslin, and then cast into the flat moulds already mentioned. Or else a muslin bag filled with colors is steeped for a time in the melted wax. The material dealers sell these slabs of wax ready dyed, to save the flower-maker from a kind of work which is chemical rather than manipulative. Some flowers require that the wax shall be used in a purely white bleached state, colors being afterwards applied to the surface at selected spots.

The wax is, of course, the chief material employed in wax-flower making; but it is by no means the only one. Wire bound round with green silk, tinting brushes and pencils, shapes or stencil patterns, moulds and stampers, flock or ground-up woolen rag, and many other implements and materials, are needed.

The building-up of a wax-flower is a work of patient detail. The patterns of leaves and petals are made of paper or of thin sheet-tin, copied from the natural object; and the wax sheets are cut out in conformity with them. Only the smaller and lighter leaves are, however, made in this way; those of firmer texture and fixity of shape are made in plaster moulds. The patterns are laid on a flat, smooth surface of damp sand; a ring is built up round them, and liquid plaster is poured into the cell thus formed. Generally two such moulds are necessary, one for the upper and one for the lower surface of the leaf. Sometimes wooden moulds are employed, into which (when moistened to prevent adhesion) the wax is poured in a melted but not very hot state. The stems are made by working wax dexterously around wires, with or without an inter-

vening layer of silken thread. By the use of flock, down, varnishes, &c., the leaves are made to present a glossy surface on one side and a velvety surface on the other. A singular mode of preparing films of unusual thinness is by the aid of a small wooden cylinder, like a common cotton reel, or rather, ribbon-reel; this is dipped and rotated in melted wax until it takes up a thin layer, which layer, when cold, is cut and uncoiled; the difference of smoothness which the two surfaces present fits them to represent the upper and lower surfaces of a leaf or petal. The combination of all these materials into a built-up flower is a kind of work not differing much from that exercised in regard to textile flowers.—*British Trade Journal.*

Copying Medals.

Copies of medals or other similar articles may be readily made by a very simple piece of apparatus. A cast of the medal is first taken in wax. This is done by moistening the medal or coin slightly, and then pouring the melted wax over it. The object of the moistening is to prevent the wax sticking to the surface of the metal. While the wax is still warm, a piece of copper wire should be imbedded in it to serve as a support, and to connect with the zinc in the decomposing cell. After removing the medal from the mold, the surface of the mold is dusted over with fine plumbago until it appears quite black; all excess of the carbon is then carefully removed with a soft brush. If fine iron filings can be had, a few of them are sifted over the face of the mold, and a solution of sulphate of copper is poured on it. It is then carefully washed; this serves to give a very thin coating of copper, and facilitates further operations, but may be omitted if not convenient. Care must be taken, in putting on the plumbago coating, that it comes in contact with the copper wire. A very convenient way of applying this wire is to bend it into a ring slightly larger than the medal to be copied, lay it on the table around the medal, and pour the wax over both at the same time. Scraping with a knife exposes it completely. The mold being prepared, take an ordinary glazed earthenware basin four or five inches deep, and in it set a small flower pot, having previously plugged up the hole in the bottom of the pot with a piece of wood, a little wax, or other suitable material. The flower pot is to be filled with a weak solution of common salt. The outer basin is then filled with a strong solution of sulphate of copper, and a little bag holding crystals of sulphate of copper is hung in it to keep it saturated. Add a few drops of sulphuric acid to both solutions, place a piece of zinc in the flower pot, and connect it with the wire of the mold. The mold being now put in the outer solution, a coating of copper soon shows itself. The mold may be left in the solution two or three days, if a thick coating is desired.—*Boston Journal of Chemistry.*

Polishing Wood With Charcoal.

We extract from the *Cabinet-Maker* the following description of the method of polishing wood with charcoal, now much employed by French cabinet-makers:

All the world knows of those articles of furniture of a beautiful dead black color, with sharp, clear cut edges, and a smooth surface, the wood of which seems to have the density of ebony; viewing them side by side with furniture rendered black by paint and varnish, the difference is so sensible that the considerable margin of price separating the two kinds explains itself without need of any commentary. The operations are much longer and much more minute in this mode of charcoal polishing, which respects every detail of the carving, while paint and varnish would clog up the holes and widen the ridges. In the first process they employ only carefully selected woods of a close and compact grain; they cover them with a coat of camphor dissolved in water, and almost immediately afterward with another coat composed chiefly of sulphate of iron and nut-gall. The two compositions in blending penetrate the wood and give it an indelible tinge, and at the same time render it impervious to the attacks of insects.

When these two coats are sufficiently dry, they rub the surface of the wood at first with a very hard brush of couch-grass (*chiendent*), and then with charcoal of substances as light and friable as possible, because if a single hard grain remained in the charcoal this alone would scratch the surface, which they wish, on the contrary, to render perfectly smooth. The flat parts are rubbed with natural stick charcoal, the indented portions and crevices with charcoal powder. At once, almost simultaneously, and alternately with the charcoal, the workman also rubs his piece of furniture with flannel soaked in linseed oil and the essence of turpentine. These pouncings, repeated several times, cause the charcoal powder and the oil to penetrate into the wood, giving the article of furniture a beautiful color and perfect polish, which has none of the flaws of ordinary varnish. Black-wood, polished with charcoal, is coming day by day to be in greater demand; it is most serviceable; it does not tarnish like gilding, nor grow yellow like white wood, and in furnishing a drawing-room it agrees very happily with gilt bronzes and rich stuffs. In the dining room, too, it is thoroughly in its place to show off the plate to the greatest advantage, and in the library it supplies a capital framework for handsomely bound books.

DOMESTIC ECONOMY.

Roast Turkey.

After drawing the turkey, rinse out with several waters, and in next to the last mix a teaspoonful of soda. The inside of a fowl, especially if purchased in the market, is sometimes very sour, and imparts an unpleasant taste to the stuffing, if not to the inner part of the legs and side bones. The soda will act as a corrective and is moreover very cleansing. Fill the body with this water, shake well, empty it out, and rinse with fair water. Then prepare a dressing of bread crumbs, mixed with butter, pepper, salt, thyme or sweet marjoram, and wet with hot water or milk. You may, if you like, add the beaten yolks of two eggs. A little chopped sausage is esteemed an improvement when well incorporated with the other ingredients. Or, mince a dozen oysters and stir into the dressing; and, if you are partial to the taste, wet the bread crumbs with oyster liquor. The effect upon the turkey-meat, particularly that of the breast, is very pleasant.

Stuff the craw with this, and tie a string tightly about the neck, to prevent the escape of the stuffing. Then fill the body of the turkey, and sew it up with strong thread. This and the neck-string are to be removed when the fowl is dished. In roasting, if your fire is brisk, allow about ten minutes to a pound; but it will depend very much upon the turkey's age whether this rule holds good. Dredge it with flour before roasting, and baste often; at first with butter and water, afterwards with the gravy in the dripping-pan. If you roast in an oven, and lay the turkey in the pan, put in with it a teacup of hot water. Many roast always upon a grating placed on the top of the pan. In that case the boiling water steams the under part of the fowl, and prevents the skin from drying too fast, or cracking. Roast to a fine brown, and if it threatens to darken too rapidly, lay a sheet of white paper over it until the lower part is also done.

Stew the chopped giblets in just enough water to cover them, and when the turkey is lifted from the pan, add these, with the water in which they were boiled, to the drippings; thicken with a spoonful of browned flour, wet with cold water to prevent lumping, boil up once, and pour into the gravy-boat. If the turkey is very fat, skim the drippings well before putting in the giblets.

Serve with cranberry sauce. Some lay fried oysters in the dish around the turkey.—*Ez.*

Boiling Potatoes.

The lady authoress of "Uncle Tom," and divers other popular publications, has been writing a homily on cooking potatoes. I should like to know if Mrs. Stowe does really boil potatoes herself? I do, and I have long since known better than to pare my potatoes raw and then douse them naked into water red-hot—boiling at two hundred and ninety horse-power. That is one way to boil potatoes certainly, but not the proper one, by a very long way. Philosophy, common sense, and a month or two of practical experience over the dinner pot, teach us great deal better than that.

My dear madam, don't you know fifteen sixteenths of all the starch that a potato affords is deposited so near the surface, that however carefully we may pare the tubers in a raw state, we are sure to throw away the greater portion of that very material that we eat potatoes for? Then, if we toss our potatoes into boiling water, unprotected by their overcoats, we have set in a second, and hopelessly incorporated with the mass, that semi-volatile principle which gives the ill-cooked potato its slightly acid, something insipid, and always objectionable flavor.

Any thoroughly potato-hred Irish woman would as soon think of committing suicide, as boiling her potatoes undressed, in the manner recommended by our literary lady cook. And there are no better potatoes, or potato cooks, any where in this world than there are in Ireland.

I tell you, fellow-housekeepers everywhere, that the correct way to cook a potato in any country, provided boiling is the determination, is to wash it clean, first—let it lie in clean cold water two hours—then is all the better—place it in cold water in the pot, without paring, boil moderately until the test fork goes smoothly through the potato without encountering a mite of core. Then drain off the water, set the pot over the fire uncovered, for five minutes, after which wipe off Mr. Potato's jacket in a hurry, and send him to the table in a close cover, piping hot—or if you are not over-fashionable and fastidious, it is preferable to serve "murphy" in his coat.

Please follow this formula a few times, and if you shall find it a pernicious practice, you shall be at liberty to consider Madeline as competent to write a readable romance, as she is to cook a potato.—*Saturday Evening Post.*

BEAN PORRIDGE.—Boil a fresh beef bone (I think salt beef would answer, if sufficiently freshened, though I never tried it), in a large quantity of water, and use the meat for anything you choose. Let the liquor become cool, and remove all the grease. Boil a teacupful of beans in three quarts of this liquor until thoroughly soft and in pieces; add a little rice, the necessary amount of salt, and just before taking from the stove, a little thickening of some kind of meal. We use it about the thickness of gruel or gravies and add a little milk when we eat.

Powder and Fuse in Mining.

An item of interest in connection with the mining industry of the Pacific slope is the immense amount of different kinds of powder used in mining. Powder and quicksilver are two important items in all mining operations. On inquiry at the offices we learn that the amount of Giant Powder manufactured during 1873 was 600,000 pounds. The Comstock mines consumed about 100,000 pounds of this amount. This powder, well known for its powerful effects and reliability, is sold at the price of seventy-five cents per pound for No. 1 and fifty cents per pound for No. 2. The quantity manufactured here, as stated above, was all sold in California, Virginia and the Territories where it is going on. The sales have increased about thirty per cent. over 1872.

The California Powder Company, who sell Hercules powder as well as common black powder, have also disposed of large quantities of each. These sales have increased very much during the last year. The black blasting powder is made in Santa Cruz, in this State, and as they seldom have more than two months stock on hand, the powder is strong and not deteriorated by time. It is preferred on account of its freshness. Most of this class of powder is used in gravel mines, though some is used in quartz. Of Hercules powder they have probably sold some 18,000 or 20,000 pounds per month during the year, and sales of this product have also very much increased as its merits are becoming known.

Fuse, of which large quantities used to be imported to this Coast, is now nearly all made here, the California fuse factory, alone, having turned out over 7,000,000 feet this year. Several other factories are in operation. The best article of fuse in the world is turned out in California and large quantities are in use.

The Mining Interests in 1873.

The mining interests of the Pacific Coast have never before been in such a prosperous condition as during the year which has just closed. They have had a season of unprecedented prosperity, and, in consequence, more attention has been turned to them than in former years. We are glad to be able to note the fact that the financial success of prominent mines has induced many people to invest money in legitimate mining rather than in stock speculation. A glance at the figures we give below will indicate to any one the importance of the mining industry to the nation and the world, as well as to the Pacific States and Territories. Many people carelessly consider that the business of mining is merely one of speculation and should not meet with encouragement. The practices of a few unscrupulous men have created a distrust of all mining enterprises among a certain class of people, who look upon the business as being closely connected with horse racing and gambling.

If these people could only make a visit to some of the prosperous mining towns of the Coast, and see the great numbers of people who earn their daily bread by this very business, and see the immense traffic occasioned by the prosperous condition of a few good mines, they might change their opinions. The business is not only important in itself, but stimulates every other business in the country. We in California are always crying out about "building up manufactures," and yet many of us decry mining, which fosters mainly the manufacturing enterprise already in our midst. We have in San Francisco a great number of foundries and machine shops, employing several thousand skilled artisans, and their heavy and most profitable business is making mining machinery. If this branch of the business were taken from them, half of these foundries would be closed and the men turned out of employment.

But how any thinking man can deny the vast importance of the mining industry in the face of the figures we give in this article, we do not see. The miners are as great producers as the farmers, and much greater in proportion to their number. Why all producers should not receive every encouragement we do not understand, yet even the Government recognizes in a very slight degree the benefits of mines. When one class of men in a few States and Territories can produce in a year a sum of over seventy-two millions of dollars, taken from out of the ground itself, they surely deserve every encouragement possible to renewed exertions. We talk a great deal about the immense wheat producers of California and its importance to the state and the nation. Of course every one will acknowledge the importance of that, but many deny that mining is of half the consequence. Now this year the exact value of the wheat of this State was \$21,337,534, and the gold product of the State was \$18,025,722. When we consider that there are without doubt at least five farmers to one miner, the production *per capita* is greatly in favor of the miner.

Bullion Product of 1873.

The most reliable figures obtainable of the bullion product are those given by Wells, Fargo & Co.'s Express, as the greater proportion of the bullion passes through their hands; nevertheless it must be borne in mind that although all the statistical tables are made upon the basis of these figures of Wells, Fargo & Co., they are always below the real product. The reason is very simple. Wells, Fargo & Co. can of course only account for what passes through their hands. Numbers of men ship their bullion through private hands, and are thus not called upon to account for it to the public; the amounts thus shipped are not taken into consideration. When we remember how many small claims send a few thousand dollars by private individuals, and that the individual owners of some large claims bring their dust to the mint, whenever they find it necessary to visit San Francisco, it is easily seen that the estimate of Wells, Fargo & Co. is always below the real figure.

Mr. Valentine, General Superintendent of Wells, Fargo & Co., publishes the following statement showing the amount of precious metals produced in States and Territories west of the Missouri River, during 1873:

WELLS, FARGO & CO.'S EXPRESS,
GENERAL SUPERINTENDENT'S OFFICE,
SAN FRANCISCO, December 31, 1873.
DEAR SIR: We hand you herewith a copy of our annual statement of precious metals pro-

duced in the States and Territories west of the Missouri River, including British Columbia, during 1873. A comparison with the statement for 1872 will show that the aggregate exceeds that of 1872 more than \$10,000,000. Arizona, California, British Columbia, Oregon, Washington, Idaho, and Montana decrease. Nevada, Utah, and Colorado increase. The increase in Nevada alone is nearly \$10,000,000, the total product of which about equals all the others. As stated in our report for 1872, we only touch the borders of Arizona; therefore the figures given do not furnish a correct basis for estimating the product of that Territory; but it is inappreciable as compared with the others. Mexico is represented in silver only, and the amount named will not give a correct idea of the product of the Pacific or West Mexican Coast, as the Pacific Mail Steamship Company carry, independent of Wells, Fargo & Co., in addition to which large amounts are conveyed by British war vessels to Panama or San Francisco, of which we make no record.

The combined product of all shows—for 1872, \$62,236,913; for 1873, \$72,258,693—undoubtedly the largest yield for one year in the history of the Pacific Coast. Yours truly,
JNO. J. VALENTINE, Genl. Supt.

Montana.....	1,171,991	229,398	3,070,883		4,472,272
Utah.....	1,171,991	229,398	3,070,883		4,472,272
Colorado.....	1,171,991	229,398	3,070,883		4,472,272
Grand Total.....	\$15,709,956	\$1,570,995	\$294,771	\$480,000	\$18,055,722

The following is a comparison with the bullion product of 1872:

	1872.	1873.
California.....	\$15,709,956	\$18,055,722
British Columbia.....	1,041,696	2,500,154
Mexico (West Coast).....		4,038,268
Arizona.....	1,116,991	4,537,702
Washington.....	1,171,991	4,472,272
Oregon.....	1,171,991	4,472,272
Nevada.....	1,171,991	4,472,272
Idaho.....	1,171,991	4,472,272
Montana.....	1,171,991	4,472,272
Utah.....	1,171,991	4,472,272
Colorado.....	1,171,991	4,472,272
Total.....	\$62,236,913	\$72,258,693

This statement is a most favorable one, showing an increase of over ten millions of dollars, in the bullion product. The yield in 1871 was \$58,284,029, about \$4,000,000 less than in 1872. There in two years the increase is over \$14,000,000. During the past three years the mines of the Pacific Coast have produced in the aggregate the enormous sum of \$192,779,035.

This year California, Oregon, Washington, Montana, Arizona and British Columbia show a decrease in production, but the increase of ten millions in Nevada brings up the figures above the total of last year. Properly British Columbia and Mexico should not be included in this estimate but the bullion shipped by private parties amounts to more than the combined yield of both of them.

The monthly receipts of coin and bullion at San Francisco through Wells, Fargo & Co.'s Express for the year is as follows:

	Silver Bullion.	Gold Bullion.	Coin.
January.....	\$236,261	\$892,477	\$917,197
February.....	323,375	585,325	621,152
March.....	312,677	653,915	663,979
April.....	1,238,128	795,404	614,544
May.....	1,342,223	855,470	687,133
June.....	970,462	976,513	692,204
July.....	1,158,758	1,176,288	914,243
August.....	1,218,393	1,208,133	671,850
September.....	1,643,596	831,587	722,629
October.....	1,820,306	773,616	1,145,760
November.....	865,476	702,107	589,308
December.....	879,072	565,193	723,651
Totals.....	\$12,177,598	\$10,052,123	\$9,515,385

The source whence this treasure was received are indicated as follows:

From northern and southern mines.....	\$26,675,721
From northern coast route.....	2,224,015
From southern coast route.....	751,234
From Mexico.....	2,101,234
Total.....	\$31,752,204

The kinds of bullion produced is given comparatively as follow:

	1872.	1873.
Gold Bullion.....	\$30,429,758 95	\$27,707,059
Silver Bullion.....	24,196,719 94	34,315,750
Base bullion.....	7,610,439 00	10,235,884
Total.....	\$62,236,913 89	\$72,258,693

The production in gold declined \$2,721,693, of which \$1,000,000 was in California.

The coinage at the San Francisco mint for the year was unusually large, the total being \$22,075,400. The total gold coinage was \$21,154,500 and the silver \$920,900. The total coinage at the Mint for the past five years compares as follows:

	Gold.	Silver.	Total.
1869.....	\$13,859,050	\$481,000	\$14,340,050
1870.....	19,848,000	507,000	20,355,000
1871.....	18,905,000	1,136,775	20,041,775
1872.....	16,000,000	380,600	16,380,600
1873.....	21,154,500	920,900	22,075,400

Mining Dividends.

After showing the product of the mines the next question is that of profit—one difficult to answer. There are no means of learning the profits made by mining companies, except those which are incorporated in this city and called on the Stock Board. The greatest misapprehension exists generally on this subject, for people suppose that because the companies do not publish statements that they are making no money. This is far from being the case, as those familiar with the subject are aware. We have compiled a statement of the mining dividends declared by companies whose offices are in this city, which differs, however, from similar statements published in other journals. Our figures are compiled in relation to those companies who advertise their dividend in the public press of this city. Numbers of "close corporations" keep these figures to themselves, and it would be difficult even to name half of such companies. The following statement of the dividends is compiled as stated above.

Belcher.....	\$6,762,000
Crown Point.....	5,100,000
Caldenberg.....	24,000
Consolidated Amador.....	150,000
Eureka.....	300,000
Meadow Valley.....	180,000
Monitor-Belmont.....	75,000
Raymond & Ely.....	300,000
Black Bear Quartz.....	45,000
Eureka Cons.....	200,000
Golden Chariot.....	150,000
E R Cons.....	60,000
Minnesota.....	60,000
La Grange.....	12,500
Total.....	\$13,356,000

In 1872 the total dividends paid by mining companies, was \$6,732,100, and 1871 it was \$4,837,950. The companies that paid dividends in 1872, and not in 1873, were the Oshalla-Potosi, \$56,000; Keystone Quartz, \$30,000; Mahogany, \$15,000; North Star, \$27,000; Pioche, \$40,000; Providence, \$3,100, and Yule Gravel, \$10,000.

In summing up the dividends as above, we only named those mines who have advertised their dividends in this city. The Diana mine paid \$1,181 as a dividend in January last, and the Idaho (Grass Valley), which is not called on our Stock Board, has paid the handsome sum of \$682,000 this year. The Keystone Consolidated has also paid dividends this year, none of which are taken into account, not being on the Board lists. The Eastport Ocos Bay Coal Company has paid \$10,000, and the Black Diamond Coal Mining Company has paid \$125,000 to its stockholders during 1873. If it were possible to obtain a full list of the dividend-paying mines, a much better showing could be made. It must be remembered, however, that the above list comprises those mines which are listed on the Stock Board. Thousands of mines scattered over the Pacific coast pay out large sums to the owners of which the public know nothing. The hydraulic mines of this State, some of which are paying very handsomely, never publish any statements, and, as a consequence, we know nothing of them. The United States Mining Commissioner never is made to produce any other list of dividend-paying mines than that published in this article. In view of these facts any one must see that the dividends are always understated.

The Assessments

For the year were levied on 148 claims and amount in the aggregate to \$6,729,743. The whole number of assessments on these 148 claims, according to the *Bulletin*, was 300. This of course does not show the number of assessments much better than the other list shows the number of dividends; but as it more necessary to advertise assessments than dividends; the list is probably fuller. In comparing these assessments with the dividends above, we find that there has been a profit to stockholders of \$6,626,257, over \$500,000 a month during the year. This was without doubt much larger, though the real sum is not easy to obtain. The total mining dividends in 1872 were \$6,731,100 and in 1873 \$13,356,000, showing an increase of \$6,614,900, or about 50 per cent. When we remember that in 1871 the total dividends were only \$4,837,950, we can appreciate the result of this year's operations. The mining interests of

California.

This year have been unusually prosperous, although the decrease in bullion product would make it appear otherwise. Quite a number of new quartz mines have been opened in this State this year, and more attention is turned to them at present than perhaps ever before. This is a move in the right direction, as there are many hundreds of good quartz claims in California which only want the aid of capital to develop into good paying properties. It is a significant fact to mention that the majority of the good quartz mines of the State are in private hands and pay well enough in themselves, without the necessity of the owners having recourse to stock jobbing operations. Several of the California street operators own quartz mines and mills in this State which pay them steady profits from one year's end to the other, and they are shrewd enough to keep such properties in their own hands. Even when they are incorporated the stock is held by a few owners who have no desire to sell. It is only when there are indications of poor rock or "petering out," that these men care to tell what the mine has paid,

and then they are ready to sell. We might mention a dozen or so cases of this kind where the mines pay reasonable profits, but the owners keep the amounts to themselves both literally and figuratively. The Eureka (Grass Valley) mine paid \$300,000 in dividends this year; is on the Stock Board and is a California mine. So is the Consolidated Amador which paid \$150,000, the Black Bear which paid \$45,000, and the La Grange paying \$12,500. The Idaho mine in Grass Valley is one of the many paying mines which are held by a few owners, and which have no stock quotations. It is an example of a mine which pays handsome profits without stock jobbing operations. During the year ending December 1st, 1873, it worked 27,624 tons of rock, which yielded \$37.91% per ton, or \$1,024,591.89. The average cost of milling and mining was \$8.61% per ton. The receipts for the year were \$1,010,612.20, and after all disbursements were made, including dividends, a balance of over \$10,000 was left in the Treasury. The dividends for the year 1873 aggregate \$682,000 or 220 per cent. on the capital stock. During the past five years the dividends from the mine were as follows:

1869.....11 Dividends, or 55 per cent.	\$170,500.
1870.....8 Dividends, or 12 per cent.	\$71,200.
1871.....12 Dividends, or 75 per cent.	\$22,000.
1872.....11 Dividends, or 52% per cent.	\$62,750.
1873.....12 Dividends, or 220 per cent.	\$682,000.

41% \$1,284,950.

This shows that 53 dividends have been paid in five years, aggregating 41% per cent. of capital stock and amounting to the sum of \$1,284,950. There are, probably, many other mines which could make as good a proportionate showing if they chose to make their affairs public; but as the owners of such mines seldom care to sell stock in them, the accounts are private. The California quartz interests instead of being "played out," are in a more prosperous condition than they have been for many years. The Idaho mine is owned by practical men who worked the mine and mill on economical business principles and not in the wasteful manner some mines are managed. The result is that they make money out of it. When people spend their own money they take better care of it than when they spend that belonging to others.

Gravel Mining.

In gravel mining, which is the principal kind of mining carried on in California, the yield for the year has been very good, when we take into consideration the scarcity of water during 1873. The old systems of gravel mining formerly in vogue have given way to more extensive methods by which more ground is worked in less time than formerly. With heavy heads of water under high pressure and all the improved mechanical appliances one of our first-class gravel claims is well worth seeing. With the new systems and an abundant supply of water many old claims long since abandoned have been made to pay handsome profits to their owners. There are no means of ascertaining the comparative yield of the gravel and quartz mines of the State, but some of the gravel mines are turning out immense amounts of bullion. Some of the yields of these claims are wonderful and prove how rich the soil of the mining counties of California is in gold. For instance, only a week or so since the Bald Mountain Co. of Forest city, Sierra county, after drifting out gravel for thirteen days and washing eight days, in all cleaned up 11,000 ounces of gold, or \$198,000. The Spring Valley Canal and Mining Co. of Cherokee Flat, Butte county, not long since sent down one single bar—the largest ever made, which was \$71,273. This was the result of 35 days' actual run with 1,000 inches of water, but only from a partial clean up. The gold obtained was from 800 feet of head flume and 14 undercurrents; while the company has 2½ miles of flumes and 28 undercurrents. The flumes had been run so full that it was almost as rich where they left off as at the head of the flume. This claim is yielding about \$50,000 per month or \$600,000 a year in gold. The gravel mines in Calaveras county have made rapid advancements during the past two years, and operations this year are larger than ever. The Calaveras Chronicle says that there are within a radius of two miles of Mokelumne Hill half a dozen hydraulics, that in scope of operations, facilities for working and yield, equal the more famous mines of the northern counties, and there is still opportunity for further locations. We have not room to mention in detail the different companies operating in California, but are confident that the coming year will be a more prosperous one than ever before.

One great point in our favor is the advent of English capital to California for investment in our gravel claims. The English investors have been badly taken in, in many instances in quartz, and they have found out that the gravel claims are surer pay than any other class of mining property. Several large claims have been sold to them this year, and many other sales are now pending. There are countless millions of dollars in the gravel banks of California, only waiting for industry and capital to bring them to light. There are in California 780 mining ditches, having an aggregate length of 4,888 miles, and supplying 220,187 inches of water per day. Nevada county alone has 76 mining ditches, which are 707 miles in length and use 33,000 inches of water daily in mining. Many more new ditches are being built and others being extended. According to the Assessors' reports for 1873, there are 243 quartz mills in California.

Quicksilver.

California, which has always been famous for her quicksilver production, is likely in the

future to become more so. A large number of new claims have been discovered this year, the majority of them in Napa and Sonoma counties. Monterey, Santa Clara, Colusa, Solano, Lake, San Luis Obispo and Fresno all contain deposits of ore containing this metal, and many of the mines are producing. Quite a number of the mines discovered this year are not producing anything as yet, as time and money are required to develop them. On many of them the owners are working away, prospecting and getting their mines ready for capital to take hold of. The producing quicksilver mines of the State are the New Almaden, New Idria, Redington, Great Western, St. John, Phoenix, Washington, Manhattan, California, Missouri, Epperson, Whittou, etc. Owing to the reticence of most of the owners, it is difficult to obtain reliable figures as to the quicksilver product. The exports of this metal for the year were as follows:

	Flasks.	Value.
New York, per rail.....	10	\$65
Mexico.....	3,324	\$74,488
Australia.....	1,000	\$8,450
China.....	700	\$3,082
Central America.....	412	\$8,714
Totals.....	5,636	\$94,799
Totals 1872.....	14,721	\$75,414

It is stated that 1,100 flasks per month are consumed in Nevada alone, about 800 flasks being used at the Comstock Lode. The price of this very necessary article has steadily risen during the year; but while it has had the effect of stimulating the development of new mines the product is said to have fallen off.

Nevada.

The State of Nevada has eclipsed all others in its bullion product this year, owing to the immensely rich bodies of ore discovered in the lower levels of the Comstock lode. The mines there are turning out immense quantities of ore and immense quantities of bullion. An idea of the business may be gained by noting the ore shipments during 1873 over the Virginia and Truckee Railroad, which according to the Virginia Enterprise amounted to 191,492½ tons. This ore was shipped from the following mines on the Comstock lode: Belcher, Crown Point, Hale & Norcross and the Consolidated Virginia.

Of this ore 100,063 tons was from the Belcher mine, 62,684 tons from the Crown Point, 23,334 tons from the Hale & Norcross, and 5,480 tons from the Consolidated Virginia mine. The ore was sent to and reduced at the Mexican, Morgan, Brunswick, Merrimac, Franklin, Vivian, Santiago and Eureka mills, on Carson river, and at the Bacon and French mills, Silver City. The Eureka mill reduced 49,342 tons, 1,450 pounds; the Brunswick, 32,454 tons, 510 pounds; the Mexican, 26,514 tons, 1,160 pounds; the French, 23,565 tons, 1,700 pounds; the Santiago, 21,790 tons, 330 pounds; and the other mills from 3,000 up to 11,000 tons each. Much ore was sent by teams to mills not accessible by rail, and some mines, as the Chollar Potosi, sent all their ores to mills in the cautious by means of teams.

The Comstock Mines are attracting the attention of the world by the immensity of their products. We have noticed from time to time the progress of work in that quarter, and deem it unnecessary to particularize here. Improvements in those mines are daily apparent, and the question with them all is probably only one of depth. A glance at our list of dividends will show the importance of two of the mines—the Belcher and Crown Point.

In speaking of the future bullion product of the State, the Enterprise says: The shipments of bullion from the Comstock mines will soon far exceed (will more than double) the largest that have ever been made in even the most productive of former years. Owing to late developments along nearly the whole length of the Comstock, the amount of ore that can be extracted is almost unlimited. Even now more ore could easily be raised than all the mills in the country would be able to reduce. We shall soon see several new mills erected. These, or several of them at least, will be put up on the Comstock a short distance below the mines to which they belong—water for running them being furnished from the new works of the Virginia and Gold Hill Water Company. For the first time in some years the supply of ore in sight in the mines is in excess of the crushing capacity of the mills now in use. There is now ore, ore, ore everywhere, and in case it shall be taken out and worked as expeditiously as has heretofore been the rule in our mines, such a stream of silver will pour out

from the State as has never before been seen. Ely district has not been as fortunate this year as last, on account of the embarrassment of its principal mine the Raymond & Ely. It is the opinion of many that the camp will receive a new impetus soon. The Pioche Record states that the amount of bullion shipped from Pioche by express during the past year was \$3,467,561.47. This is equal to \$288,963.65 each calendar month, \$66,683.87 per week, \$9,526.27 per day, \$396.92 an hour, \$6.61 a minute, and at every tick of the clock 11 cents. The total amount would coin 6,935,123 half dollars, and if these were placed in a straight line would reach 240,869 yards, or nearly 137 miles, sufficient to enclose, with half dollar pieces, a body of land 3¼ miles square.

The aggregate shipments of bullion from Eureka district the current year, is laid down at \$3,907,000. The yield last month was very large—\$350,000 or about \$1,200,000 per annum. They are reducing there some 350 tons of ore daily with prospects of a steady increase.

White Pine district, which has been in the shade for some time, is picking up a little. The News gives the statement of silver bullion shipped from that county during the last three quarters as follows: Quarter ending March 31st, 1,851 tons of ore produced \$33,425; quarter ending June 30, 4,904 tons produced \$178,832; quarter ending September 30, 5,384 tons produced \$165,737.

This is a fair showing for a county so dull as White Pine. We may expect an increase during the succeeding three months, the Eberhardt mill being in full blast and producing large quantities of bullion.

We have not the space to particularize other than the leading districts of Nevada, but the immense bullion yield for the year—\$35,254,507 speaks for itself. This is about ten millions more than last year.

Utah Territory.

Has made more rapid advances in mining this year than ever before. Some of the leading mines are turning out immense amounts of bullion, and the exports in the last month of the year alone from Salt Lake City amount to 1,637,791 pounds of ore, 1,241,000 pounds of bullion and 380,000 pounds of lead. Utah ranks third on the list of bullion producers, her product being nearly a million in excess of Colorado, rather a startling fact considering that Colorado has had so much the start of her. Utah has had to fight against the effects of several bad mining swindles, and had to meet the reaction consequent on a too sudden inflation of values. The financial panic also affected the mining interests of the Territory greatly. Few well developed mines are yet to be found in Utah, most of them being only partially developed, but so much attention is paid to the industry at present that a great

increase in the number of paying mines, and in the amount of bullion production may be looked for next year.

Arizona, Montana and Idaho.

Arizona, though a rich mining Territory, still suffers from its Indian fighting, and its isolated locality. Some exceedingly rich ore has been shipped to this city from there this year, most of which was from new or partially developed mines. With the opening of a railroad through this Territory the mines will be opened, and new districts prospecting.

Montana shows a falling off in her bullion product, owing to the decadence of the shallow placers. Several new and promising mining districts have been opened this year, which may change the state of affairs in 1874. The long winters of Montana are detrimental to the gravel mining interests, but the Territory has done a great deal even this year, towards swelling the bullion product of the United States.

In Idaho the bullion product for the year also shows a slight falling off from that of 1872, yet they have had prosperous times this year. The bullion product of the principal mines about Silver City alone was \$1,000,000 in 1873, and they claim to be able to double it in 1874. The Golden Chariot, one of Idaho's prominent mines, has made good dividends this year.

Oregon has turned out \$1,376,369 this year, all of which has been gold. Some of the new mines recently discovered ought to bring this amount still higher in 1874.

The Washington Territory product was also nearly all gold, only \$3,054 out of \$209,395 being in silver.

Colorado shows an increase of over \$1,000,000 from its bullion product of 1872, and its mining interests are in a prosperous condition.

Croft's Life Protector.

Geo. A. Croft, of Croft's Western World, while in this city last week showed us an invention of his which is intended, in case of fire, to protect the eyes from heat and smoke and the respiratory organs from the effects of suffocation. This "Life Protector," of which an illustration is given herewith, is a new invention, and it is claimed that it will entirely justify the opinion of practical men who have seen it, and who agree that it will prove of incalculable benefit, needing but a simple trial to convince one of its utility and value. As shown in the cut, the invention consists of a shield or guard of hard rubber, with flexible edges, which fits the conformations of the head and face so nicely that no smoke can enter, while the exhalations of the breath are at the same time excluded. While thus shielded, the eye-sight is kept unimpaired by strong pieces of glass. The nostrils and mouth are protected from smoke, heat, vapor or gases, by a curtain of suitable material, depending from the rubber frame-work, and fastened closely around the throat and at the sides. The whole is confined by a band which passes over the head. To increase the efficiency of the "Protector" as a respirator, a wet sponge is placed inside the curtain which covers the mouth.

It is quite simple and cheap, \$5 at retail, and may be rolled up and put in the pocket easily. With fire-extinguishers they are very convenient, as the use of one will enable a person to carry an extinguisher into places where he could not otherwise go. It will greatly increase the value of the extinguishers, now so generally used. There are many uses to which it will be put. Persons living in hotels will keep them for their own safety, remembering that suffocation often causes death where escape would otherwise have been easy; for miners and others it will obviate danger from noxious gases; with it apirians can live their bees without danger; and the ways indicated suggest but a tithe of those in which the "Protector" will prove beneficent in the salvation of life and property.

Beers' Patent Gold Crowns.

While it is the province of the skillful operator to save and not destroy, yet he is often called to extract the ruins of a once fine molar, or other organs of mastication, that have been so broken down by decay, or whose walls are so fragile as to be beyond the reach of all former modes of restoration; in such cases, especially, this invention must be hailed with delight, for if skillfully applied it restores them again to usefulness and beauty. These caps or crowns are made of 20 carat gold, highly finished, of assorted sizes, and in shape, exact representations of the natural teeth.

Our cuts explain themselves. In applying the new process, the operator first removes the decayed portion of the old tooth, until nothing is left but a sound and firm basis on which to build. The stump is then filed in the usual manner. A crown is next selected of approximate size and shape, and it is accurately fitted and trimmed, care being taken to obtain a close articulation with the natural tooth, or what is left of it. Into the gold filling a small gold screw is inserted, and its head is made to project, so that when the crown, or shell, is filled with cement, of oxichloride of zinc, or other suitable material, the whole will form a compact and lasting tooth.

The advantages of this process over the old method, of building up by hammering on gold foil, as in ordinary fillings, until a sufficient size has been obtained, are the increased stability secured, and the greater ease in working. This latter point is an important one, as frequently and usually the old tooth is not firm enough to bear the incessant hammering which is required to solidify the mass.

Dr. Beers has, in this invention, added largely to the scope and utility of the science of dentistry, which is shown in many other ways to be a truly progressive one. New and improved tools are daily making their appearance, and the tendency is to shorten the duration of operating, and to lessen pain, while in every respect the workmanship of dentists is far superior to that of years past. One thing remains to be discovered, and many are now engaged in its search, and that is, a composition which shall be as satisfactory as the material of which false teeth are made, which can be easily applied, and which will not require heat to fix and glaze it. When this is found, sugar, acids and old age may be defied, and society will be perpetually on a broad grin.

LIFE PROTECTOR.

TOOTH CROWNS.

Scenes in the High Sierras.

[Written for the Press by J. G. LEMMON.]

Leaving Yosemite.

Down from cloud-land, out from Paradise and on the dusty road again. So transcendent has been the scenery of the last two weeks that we are quite unwilling, though compelled, to turn our footsteps homeward, there to digest the mental pahnulm garnered. The reflection that, according to all accounts, we never shall look upon a fairer scene, caused us to gaze to the last opportunity over the rim of the receding Yosemite—one of the last objects reeting upon the retina of the eye, and thence preserved indelibly on memory's tablet, being the ever-lovely, shining, leaping fall of Po-ho-no, tearfully waving us a last adieu, but as sweetly inviting us back to view the Great Gallery again, at any future day.

After Yosemite, what can arrest attention or command description? We have no first-class volcano, like Kilauea, within easy reach, no Mammoth Cave; but we have one of the most extensive and stupendous works of man. Let us make a slight detour and add the mines of the Comstock lode to our other unrivalled "scenes."

Hastily glancing, on our return by the upper road, at Sonora,—the queen of California cities, enthroned among fruit-orchards and vineyards,—curiously examining the singular lime-stone natural bridges over Coyote creek, we approach again the Calaveras grove of big trees.

These great sequoias—monsters among the monsters—ever have power to arrest attention. Here we rest for a night, glad of the chance, ere evening shadows fall, of again roaming through the grove, mounting the stile to the upper side of the "Father of the Giant," gaze, wonder and adore. Great preachers are these big trees, preaching great truths. They tell of power, of wisdom, of far-reaching plans, but, best of all, they argue immortality for man. When we reflect that they have lived three thousand years, and that as there is no natural limit to the life of the *exogenous*, or outside growing plant, it is not unreasonable that man, with powers of infinite imagination, of limitless conception, of boundless aspiration, of universal belief and hope; it is not unphilosophical that the spirit of man is fitted for and will exist throughout eternity.

Gathering cones, sprays of foliage and several rare flowers, and adding to our already plethoric baes, we pursue our journey up to Hermit Valley, where the road to Lake Tahoe northward comes in, which we do not return upon but continue up the excellent turnpike eastward toward Silver Mountain.

The first part of the road is a long, tortuous climb up a crooked cañon to a pass at the great elevation of 9,000 feet. Except the sublime scenery of terraced mountains of lava on all sides, with dim stretches of valley between, and glistening peaks of snow in the far south, there was little to enliven the journey. Slowly the weary miles were added to the 500 already passed. So crooked was the road that often our camping place at night was in sight of that of the previous night, and the camp-fire of noon half sent its curling smoke through the pines on the last spur below.

Silver Mountain.

At the dilapidated county seat of Alpine County—well named—my comrade suffering a violent attack of toothache, was deprived of a much coveted chance to scale the rough and difficult side of Silver Peak, 11,060 feet high, one of the highest in central California. Alone, in the still ether, I stood upon the splintered summit, above the clouds that rifted through the passes below. Chief of the splendid views from this lofty perch was the group of peaks around Yosemite, fifty miles away to the south.

Among them shone Cloud's Rest, and, ever conspicuous if in any country, the mysterious South Half-Dome, a monument at the head of an empty colossal grave, or better, a shining land mark telling where is given to man a second Eden.

Northward John Brown's monument, and beyond, lying around the hidden Tahoe, were plainly seen John's Crystal and Tinker's Peaks; while 20 miles, farther across the railroad, nrope the dim triple turrets of Castle Peak. Nearer at hand northeastward across Carson Valley reposed the lower but most important peak in a financial view, in the known world—the silver-boweled Mt. Davidson. In the deep cañon leading to it and scattered over its east side glinted the cities of Silver, Gold Hill and Virginia. This view filled up an important interval in the observed topography of the high Sierras.

A year before I stood upon the lofty Laesen's peak in the far north; a year before that upon the gold-hearted Downieville Buttes; six months ago upon Castle Peak, near the railroad; a month ago upon John Brown's monument, near Hope Valley; last week upon Cloud's Rest, above Yosemite; and to-day, this lofty Silver peak between the two last, commands a fine view of many of the rest. On this sum-

mit among the splendid rocks of lava a "poor Piccola" was found. It belongs to the *Crassulacea* order, and is so sensitive that it rose up from my accidental tread, expanded its leaves all dripping with expressed juice and tremblingly warned me not to wound it again.

Carson Valley.

Carson valley is one of the largest and most fertile of mountain valleys, apparently, on this coast, but its thrift is retarded by a monopoly of its irrigating waters held at so high a figure that only the wealthiest farmers can buy—a matter for the Granges to look after.

Carson City is making substantial progress, owing to the establishment of the State buildings; the branch U. S. mint, and lately, by the locations of car shops there. We were kindly conducted through the mint—space forbids its description.

Passing up a deeply rutted road eastward, telling of heavy freight wagons, we heard first, the measured thump of a quartz battery, then came into view of Empire, a new town built up near two very large quartz mills on the Carson river, reducing ore brought from the distant Comstock lode by railroad, and also by the old-time big quartz wagon with its 10 mone-ter mules and one or two "hack actions."

A Noisy Canon.

Passing over a low divide, we were saluted by a tumultuous roar from pounding batteries, grinding machinery, and busy workmen, all swelling up from a narrow deep cañon below—probably the noisiest in the world. Twenty-five or thirty quartz mills—some with 40 to 60 stamps—are pounding away there nearly every day in the year, reducing by the nicest and costliest machinery the silver raised from the deep mines beneath Mt. Davidson. Around these mills are placed the boarding houses, shops, saloons, etc., resting one side against the mountain, the others upheld by posts and walls. One street threads the bottom of this cañon, and the buildings on each side form nearly a continuous wall. Though by their proximity forming one community, this densely peopled cañon has two names, Silver City and Gold Hill. Beyond, over another divide, lay terraced along the slope of Davidson the prodigy of mining towns, Virginia City—5,820 feet above the sea level; and, until the founding of Hamilton, another mining town in the same State—the highest of its size in the world.

We were assured that, large as were these towns, aggregating over 10,000 souls, the mines on the Comstock lode beneath, contained more than twice as much building material, and this information but increased our anxiety to descend to the shafts of the most extensive, most expensively worked and best paying mines ever known. By the kindness of Alfred Doten, editor of the *Gold Hill News*, letters of introduction were given to us to mine superintendents, and we prepared to make the decent the next day.

In the morning, reflecting that the officials would not heed duty until late, we climbed the husby side of Davidson, 7,825 feet high, and enjoyed for an hour a view of the cities below, the valleys around, the peaks, beyond and the great alkali desert stretching away to the east, recalling the many stories of suffering in the days of caravans. Descending the south side into the noisy cañon again, we seek the mining officers, readily obtain permission and a guide, and are prepared for our further descent by changing our clothes to a suit of heavy woolen. We were then led into the lofty building where the monster hoisting works stand near the deep shafts from which the hot and smoky air rises in a swift column.

MINERAL PRODUCE OF RUSSIA.—The "*Tableaux Statistique de l'Industrie des Mines de Russie en 1871*," which was published by M. Skalkowsky in connection with the Vienna exhibition, contain the following data with regard to Russian mining industry. In 1871 the number of mines owned by Russia, and producing gold was 979, platinum 6, silver-lead 21, copper 76, iron 1,174, zinc 6, cobalt 1, tin 1, coal 326, pyrites 1, chrome 6, rock salt 4, besides 697 naphtha pits. Their yield was from 17 million tons of gold sand, 86,400 lbs. of gold, from 168,000 tons of platinum sand, 4,504 lbs. of platinum, 35,120 tons of silver lead ore, 100,365 tons of copper ore, 820,000 tons of iron ore, 42,400 tons of zinc ore, 10½ tons cobalt ore, 8,000 tons pyrites, 817,000 tons of coal, (black coal and brown coal) 22,000 tons of naphtha, 7,000 tons of chrome iron ore, and 455,000 tons of rock salt. The smelting works of Russia produced from these raw ores, silver 29,000 lbs., lead 1,740 tons, copper 4,200, tin 8, spelter 2,700, pig iron 354,000, iron castings 30,000, wrought iron 241,500, steel 7,000, copper sheets 350, and zinc sheets 500 tons, and material for 11,255,000 roubles. The works gave employment to 266,300 men.

HOW TO TREAT BURNS.—The less that simple cuts, bruises and burns are meddled with, the better. If they are kept clean and excluded from the air, nature will take care of the healing process. The salves and lotions so commonly used are generally irritating rather than beneficial, and hinder rather than hasten the cure. For cuts, a little court-plaster to keep the edges of the skin together; for bruises, wet cloths; for burns, a covering of dry wheaten flour are usually all the treatment, and the very best, that can be used. If from an unhealthy state of the body or from external irritation, inflammation is produced, something more may be required, the remedy varying with the special case.

Salted Mines.

The article of Mr. Henry Sewell's in Sunday's *Tribune*, and his criticism upon the salting of mines, together with the remark that he had waited for citizens to contradict the absurd nonsense about salting lead and silver ores, has called the attention of miners to the fact that such a contradiction was and is necessary. The patent absurdity of seriously talking about it is well known to Mr. Sewell, and all others at all posted about mines or ores. The outside world has heard of loading a short gun with placer gold, and shooting it into the clay and gravel banks of exhausted placers to deceive some eager miner with a pan or two, into paying a few hundred dollars *poco mas amanos*. That the same thing might be done on a large scale with a mine, hearing lead, and silver, is merely a waste of breath. But let us go a little more into detail than Mr. Sewell has seen proper to go, for the very reason, as I conceive, that he had not the patience to talk or write about it. If it is true that such men as Joab Lawrence and Mr. Whitney have been arrested, hand-cuffed, and spirited out of our midst on no better ground than that the Eureka mine was salted, it is time to post the new mining world with some of the reasons why we say that no sane man would attempt such a thing. As Mr. S. says it would require the extracting of hundreds of tons of worthless rock, and the space to be filled with pay ore, and when the mine happens, like the Eureka, to be the best and leading mine, it would be exceedingly awkward and troublesome to transport and put this ore in place. Most people would prefer to sell the mine from which the salt came and let the other go, and then after all the laborer, who would he deceived? Certainly no capable mining engineer, or any honest miner. Ores or rock of any kind cannot be excavated and the space filled with other ores without the miner knowing it the moment he strikes a pick into the disturbed mass. Men and miners may imitate many things, but a mine with its ore, casing, etc., in places as God put them, cannot be imitated. The result of a few tons of crushing or smelting may be easily falsified, but to say that the mine was salted to deceive the eyes of any honest expert, is twaddle. If men buy mines upon a few pounds of rich specimens, with the hope of large gains, and do not double their money the next day, does it justify the employment of the terms, swindler, humbug, salted pocket, to every person who has received a dollar of their money; and this, too, when the mine is worth all, and, for anything they know, far more than they paid? But their enthusiasm has cooled; they have not made a fortune out of a few hundreds or thousands invested, and if they hope to compel a return of their money by this kind of cackling, it is unscrupulously resorted to. Last spring the owners of the Emma were going to disincorporate and abandon that mine as worthless. A few people here and in Alta would have relocated that mine without unnecessary delay; but they seem to have reconsidered the motion. The Eureka mine may have been sold for more than it was worth; I know nothing of the business. But that it is a mine that needs salting, or was salted, I do not believe. And if it is not a large and valuable mine, that fact will be news to many who have examined it and believe it to be one of the great mines of the Territory. Messrs. Lawrence & Whitney may have done something of which complainants can justly complain. But if Ward *et al.*, have nothing better than salted Eureka to rely on, we think they will get pickled, if not thoroughly salted, before this case is ended.—*Cor. Salt Lake Tribune.*

IMPROVED FIREPLACE.—Fredrick Proudfoot, Toronto, Canada, has an invention which consists of a fireplace, provided with an open front and back and a single fuel or fire chamber to enable it to be inserted into partition walls of rooms for heating two adjacent compartments, and so arranged that it can be readily converted into a single or one-front fireplace. The invention further consists in the provision of a suspended fire or fuel basket located in the chamber of the fireplace, and possessing a tubular shank adjustable on a stationary tubular post, said basket being also provided with counter-balance weights to cause the same to be elevated into the chimney when the fuel is removed. The invention also consists in the use or combination with such a fireplace of a steam generating boiler or tank, and pipes to convey steam to the fire-basket for aiding the combustion of the fuel, while the surplus steam is conveyed to the dome of radiation, and finally to the chimney.

HOMINY CROQUETTES.—To a cupful of cold hoiled hominy (small grained) add a table-spoonful melted butter and stir hard, moistening, by degrees, with a cupful of milk, heating to a soft light paste. Put in a teaspoonful of white sugar, and lastly, a well-beaten egg. Roll into oval balls with floured hands, dip in beaten eggs, then cracker crumbs, and fry in hot lard.

An immense deposit of shale filled with oil has been discovered on the line of the Union Pacific Railroad, about 300 miles west of Cheyenne, Wyoming. The shale burns freely, and can be used as fuel in manufacturing the oil.

Frame Buildings.

We in America, if we would secure ourselves from the repetition of wide and overwhelming conflagrations, must be governed by Old World examples, and abandon that extensive use of timber which has characterized American structures of all kinds. Whole cities of frame buildings are altogether too unsafe to tolerate. Planks are entirely too perishable, too frail, too combustible, for houses; and their use, excepting for flooring or interior trimming, ought to be prohibited. Many of our towns of large size are composed entirely of frame buildings; fires of frightful extent continually occur in them, and they rest ceaselessly under the danger of total extermination.

It is surprising how largely timber is used in our architecture. Sometimes handsome and costly churches erect on their stone towers epines of timber. Brick and stone buildings have often wooden cornices, and a more effective device than this for encouraging the progress of a conflagration could hardly be conceived. In large cities like New York the erection of frame buildings is prohibited, and it has become a question whether a similar restriction should not extend to all congregations of buildings, however small. It has become a fashion in this country to admire frame buildings. Large, and even pretentious villas, in suburban places, are, by choice, constructed like big tinder-boxes, the perishable and the frail seeming to be preferred to the substantial and the lasting. The houses that are erected in such numbers in the villages and towns outlying our great cities are built as if on purpose to supply, at some day, the material for a tremendous bonfire. A single match might ignite them. In no other country are the rates of insurance so heavy as in ours, in none others is the insurance business so extensive, and in none others is it rendered so precarious in consequence of extensive conflagrations. We burn up in every decade enough property to enrich half the population. We spare no expense in ornamenting and beautifying our structures, and yet seem to grudge the cost of rendering them stable and secure. What is needed in order to prevent disastrous conflagrations is far less of ornamental trickery and very much more of substantial strength in the buildings than now mark any of our frail and dangerous commercial centers.—*Am. Builder.*

Mining Sales in Utah.

In a letter to the *Salt Lake Tribune*, a correspondent writing from Bingham City says:—Within the last two weeks no less than five cash sales of mining property in this cañon have been consummated.

The Last Resort Mine, in Bear Gulch, was lately sold to an Eastern company for the sum of \$25,000.

The sale of the Montreal mine and tunnel, to Chicago parties, has just been effected at a large figure. They will commence the immediate shipment of 30 tons of ore daily.

The Utah Mining Company, composed of some of the wealthiest and most influential men of Buffalo, N. Y., completed their organization last Saturday, with a capital stock of \$300,000. They have purchased a group of 15 mines in Black Jack Gulch, embracing an aggregate of 9,400 feet, the character of the rock being milling ore. In all probability, a mill at the mouth of Butterfield Cañon will be an early result of their energy and enterprise.

The Oquirrh Silver Mining Company, was incorporated a few days since, for the purpose of working and developing the Seaman and Nahot lodes, and four as fine looking prospects as have yet been struck in this district. This constellation is situated in Carr Fork, a tributary of Bingham Cañon. Capital stock, \$875,000, with a working capital of \$187,500.

The Moose mine was purchased by San Francisco parties, and Mr. Kidd, of Dundee, Scotland, last week, for a good round sum. It is believed to be an A 1 property.

WOMEN'S OCCUPATIONS.—The last census returns show the existence of more trades and professions among women than one would suppose possible. Besides women farmers there are forty-five female stock herders, five barbers, twenty-four dentists, two hostlers, three professional hunters and trappers, five lawyers, 535 physicians, ninety-seven clergymen, seven sextons, ten canal women, 195 day women, one pilot, four gas stokers, thirty-three gunsmiths, seven gunpowder makers, sixteen ship riggers, with a large number of artisans, mechanics, inventors, telegraph operators, and teachers of navigation.

The presence of good quality of bituminous coal, and in great abundance, in Montana Territory, is no longer a question of doubt. The people of Helena and other towns in the Territory, after having given the matter thorough tests heretofore, have this winter made definite arrangements for substituting coal for their pine wood in a practical use as fuel.

MINT CHOW-CHOW FOR ROAST LAMB.—Take one third onions, two thirds cucumbers; add pepper, green pepperc, and mustard; chop altogether, finely; put into a jar and add strong vinegar and salt; work it up, and in a few days it will be fit for use.

The largest mining ditch in the State is that of the Amador Canal and Mining Company, which is ten feet on top, six feet on the bottom and three feet deep.

Paying for Mineral Lands.

On December 15, 1873, the following bill was introduced into the House of Representatives by Hon. J. D. Ward of Chicago, and now before the Committee on Public Lands:

A bill supplemental to and amendatory to the Act entitled "An Act to promote the development of the mining resources of the United States," approved May 10, 1872.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that any person, association or corporation, qualified under existing laws to receive a patent from the United States for mineral land, who claim mining locations upon veins or lodes of quartz or other rock in place, bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposits, or placer claims, situate upon the public domain, upon which the sum of not less than \$500 has been expended in labor or improvements, shall, within one year from the date of the passage of this Act, file with the Register and the Receiver of the proper Land District, in manner prescribed by the Act to which this is supplemental and amendatory, an application for a patent for the mine, mining ground, land and premises so claimed; and if no adverse claim be filed during the publication of the notice thereof, such claimant shall, within three months from the date of such filing of his application, make the final proof required under said Act, and pay for the land, included in his claim at the rate of ten dollars per acre.

Sec. 2. That in the case of mining claims which now are, or may hereafter be located, and upon which the sum of \$500 has not been expended in labor or improvements, the claimants thereof shall make application for patent therefor, in manner prescribed by law, within one year from the time when such \$500 shall have been expended in labor or improvements thereon, and shall make final proof and payment therefor, in manner and at the rate aforesaid, within three months from the date of such application, if no adverse claim be filed during the publication of the notice: *Provided*, That nothing herein contained shall be considered as releasing the holders or claimants of unpatented mining locations from the obligation to expend the amount in labor or improvements thereon during each year such mining claims remain unpatented, as now required by law.

Sec. 3. That where an adverse claim is filed, and the right of possession shall be determined by judicial decree, in manner provided by the seventh section of said Act of May 10, 1872, the party in whose favor such final judgment shall be rendered shall, within six months from the date of the rendition of such judgment, make the filing required in such cases by said seventh section, and pay for such claim at the rate of ten dollars per acre.

Sec. 4. That where, under existing laws applications for patents for mining claims have been made, and due notice thereof given, without the appearance of an adverse claimant, and in which cases no further proceedings have been had for the purpose of perfecting title, the applicant, his heirs, successors or assigns, shall make final proof and payment, at the rate herein fixed, within six months from the date of the passage of this Act.

Sec. 5. That all affidavits required to be made under this Act, or the Act to which this is supplemental or amendatory, may be verified before any officer authorized to administer oaths, and all testimony and proofs may be taken before any such officer, and, when duly certified by the officer taking the same, shall have the same force and effect, as if taken before the Register or the Receiver of the District Land Office.

Sec. 6. That upon the failure of the claimants of any mine, mining-ground, claim or location, to comply with the provisions of this Act, the mine, claim, or location upon which such failure occurred, shall be open to relocation by other parties in the same manner as if no location of the same had ever been made: *Provided*, That the said claimants, their heirs, successors, assigns, or legal representatives, have not made application for a patent for such claim after such failure and before such relocation.

Sec. 7. That all Acts or parts of Acts inconsistent herewith are hereby repealed.

SILVER BRICKS FOR SCHOOL PRIZES.—Patrick Keys of Virginia, Nevada, has just had molded thirteen beautiful little silver bricks which he intends presenting to the public schools of that city and Gold Hill as prizes to be awarded to the best scholars. Each brick, according to the *Evening Chronicle*, has a ring attached to one end, and through this is passed a blue ribbon to be tied around the neck of the little child to whom it may be awarded. The sight of these beautiful and valuable prizes will most certainly excite the ambition of the little ones and stimulate them to renewed efforts to excel, and thus will the interest of education be promoted and the laudable end aimed at by Mr. Keys accomplished.

CONNECTIONS will be made within a few days which will thoroughly ventilate the 1,300-foot level of the Belcher mine, and afford them the long desired opportunity of hoisting their ore through their own shaft.

SEVENTY-ONE mining claims were recorded in the Ely mining district last year.

Vein Formation.

An article on this subject which was written for the *MINING AND SCIENTIFIC PRESS*, by J. R. Morton, has called forth the following from J. E. Clayton, in the *Utah Mining Gazette*.

In the *Mining and Scientific Press*, of December 27th, is published a very able and interesting article on the 'origin of veins and the formation of mineral lodes,' by J. R. Morton. To regard to the manner in which fissures are formed, his statement of the facts are so clear and conclusive that I can only give my cordial approval. He then comes to the question as to how the fissures were filled, and says: "This is not always readily answered. The theory which holds good in one instance, may be utterly at fault in another. Thus in the copper mines of Lake Superior, the metal is so closely associated with dikes of undoubted igneous origin, that injections of the metals and enclosing trap, at the same operation, at once suggests itself." To this conclusion I must take exception. I do not think the facts point to the conclusion that the native copper was ejected with the trap rock in a molten state, the facts show the reverse to be the case. Most of the copper, especially that in the cavities of the amygdaloid trap, is beautifully crystallized, and chemically pure, whilst in many instances, crystals of native silver are formed in the same cavities, and sometimes interlaced with the copper crystals, and both pure.

Besides these significant facts, crystals of calcite, agates and other minerals are found so associated with the crystallized metals as to preclude the possibility of their purely igneous origin. Any theory that holds good in one instance and is utterly at fault in another, cannot be a true theory, and should be abandoned as a mere speculation based upon an improper examination of the facts. If the copper and silver in the mines of Lake Superior had been ejected with the trap, in a molten state, the metals should have been run together in the form of an alloy, instead of each being pure, and in actual contact with each other. Besides this, it is well known that the crystals of agate, quartz and calcite, could not have been formed until the trap became sufficiently cooled to allow water, or at least hot steam to penetrate the mass of porous trap rock. The metals, copper and silver, must have penetrated the fissures and cavities of the igneous rocks, in a state of solution, with the steam and hot water; the chemical reagents being such that they were deposited in the metallic state, instead of sulphides, or other forms of the ores of those metals.

Copper is much more easily soluble than gold, yet we find gold deposited in the metallic state in such positions and associations, as to preclude the possibility of its igneous origin. The statement of Mr. Morton that 'the same phase of vein formation of Little Cottonwood Cañon, Utah,' as that referred to at Lake Superior, is certainly something new to mining men and scientists that have devoted much time and study to a proper understanding of the vein formation of Little Cottonwood District. There can be but one true theory of the formation of ore deposits. Local conditions control the operations of the law in so far as results may be considered, but as no two localities have ever presented precisely the same conditions, we cannot expect to find the same results wrought out in any two places just alike. Nature has produced just what the materials and the conditions under which they have been brought together would warrant. She never comes short of, or over steps the limits of law.

MINING ACCIDENT.—Despatches from Austin, Nevada, dated the 6th inst., says: James Teesider, a native of Cornwall, was killed in the 3,000-foot level of the North Star mine, Lander Hill, this afternoon, by a large rock falling upon him.

DEWEY & CO.,

American and Foreign

Patent Agents.

No. 338 Montgomery St.
SAN FRANCISCO.

Patents Obtained Promptly.
Caveats Filed Expeditiously.
Patent Reissues Taken Out.
Patents Secured in Foreign Lands.

A NEW BOOK.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings
BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, \$10.50; in leather, \$12 (currency). Forwarded by mail for 50c. extra, by DEWEY & CO.

JUST PUBLISHED.

Froiseth's New Sectional, Topographical and Mineral MAP OF UTAH.

SIZE, 40 BY 56 INCHES; SCALE, 8 MILES TO AN INCH.

Handsomely engraved on stone, colored in counties, and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all GOVERNMENT SURVEYS made to date. Price, mounted, \$8; Pocket form, \$5.

—ALSO—

New Mining Map of Utah, Showing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake City. Price, pocket form, \$2.50.

—ALSO—

Froiseth's New Map of Little Cottonwood Mining District and Vicinity, Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price \$3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LECOUNT BROS. & MANSUE, San Francisco. 10v25-tf

DEWEY & CO., American & Foreign Patent Agents,

OFFICE, 38 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counselors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the rights and privileges of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 38 Montgomery street, S. F.

SHAREHOLDERS.

TRUSTEES, and SECRETARIES of

ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor each practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assosom ent Law.

Mining and Other Companies.

Order to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Diamond Silver Mining Co.—Notice.

A meeting of the stockholders of the Diamond Silver Mining Company, of Tintic District, Juah County, Utah Territory, will be held on Wednesday, the 18th day of February, 1874, at one o'clock p. m., at Sherman's Building, No. 606 Montgomery street, Room 12, for the election of Trustees for the ensuing year. The subject of levying an assessment upon the capital stock of the company will also be determined.

By direction of the Board of Trustees,
Wm. Sherman, President.
San Francisco, Cal., January 12, 1874.
ja-6t

Commercial Coal Mining Company, of San Francisco. Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of December, 1873, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, room No. 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1874, will be delinquent. Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of January, 1874, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, room No. 23, San Francisco, California.

Office, No. 402 Montgomery street, room No. 23, San Francisco, California. de29

Cupel and Tiger Silver Mining Company. Principal place of business, San Francisco, Cal. Location of works, Wallapai Mining District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of October, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of those patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

Important to Miners and Mill Men.

Beach Mining.

The mining operations carried on at Gold Bluffs, where the auriferous sand is gathered from the beach, are something peculiar to California, but very little seems to be known concerning these mines and the way they are worked. The deposit of auriferous gravel is on the coast line of Klamath county, Cal. In 1850, when this portion of the coast line was still in undisturbed possession of the Indian tribes, a party of adventurers traveled from Trinidad up, seeking for the mouth of Trinity river, which instead of being in reality an affluent of the Klamath, was supposed to have a separate mouth. One of this party was J. Johnson, now a resident of Crescent city. At a favorable spot on the beach they saw glittering particles in the sand, which on examination proved to be gold. After collecting some of this gold they went back greatly excited to Trinidad to procure provisions, etc.

On their return, however, they found nothing but a bed of gravel, a change in the direction of the surf having carried away or covered up the gold. It may be remarked that when the direction of the wind is such that the surf breaks square on the beach, it rolls up masses of coarse gravel and no black sand is visible; but when it cuts the beach at an angle the gravel is washed into heaps in certain spots, and in others black sand is deposited, more or less rich in gold. After the discovery mentioned above ensued the famous "Gold Bluff excitement," well remembered by many early Californians. The first mining claim taken up was located by Bertrand and Nordhamer in that year. The beach sands were worked in rockers and sluices. From that time to the present these beaches have been steadily worked, the highest amount taken out in one year up to the present being said to be \$25,000 for the lower claim. The proprietors have, however, labored under the disadvantage of a scanty supply of fresh water, not being able to keep their sluices running more than one-third of the time.

At the last meeting of the California Academy of Sciences Mr. A. W. Chase, of the United States Coast Survey, read a paper descriptive of these bluffs, and presented at the same time drawings showing a general view of the mining ground and sections of the bluff. He describes the coast line, coming from the north after leaving the Klamath river, as being extremely broken and rocky. At a point about four miles south of the river, banks and deposits of sand appear, although the commencement of the bluffs proper is at the mouth of the Ossega creek and seven miles from the Klamath. Then for nine miles there is an almost unbroken line of cliffs, varying from one to five hundred feet in height. Many of the bluffs are absolutely vertical, and in some instances are overhanging. At low water there is a narrow beach, but when the tide is full the sea washes directly against the base of the cliff, the beach being then impassable. A view of the beach is shown in Fig. 1 of our engravings.

The mountains back, of which the bluffs form the sea escarpment, are all one immense mass of gravel, of varying size and distinctly marked layers or stratifications. This gravel can be traced across the country northeastwardly to a point on the Klamath river, about thirty miles distant, where the same form of deposit makes its first appearance as you descend the river.

As the bluffs are similar, or nearly so, in stratification, we give a cut (Fig. 2), made from drawings by Mr. Chase, showing the section of the cliff. The height of this cliff from low-water mark is about 227 feet, the sketch showing a vertical section. The thickness of different strata are by estimation, as Mr. Chase had no available means of determining them with exactness. Commencing from the top, there is first a section of ten feet of loam and then twenty feet of yellow clay.

FIG. 1.—The Beach at Gold Bluff, Looking South.

Then forty feet of coarse yellow gravel, which covers a stratum of sandstone of brownish color, 10 feet in thickness. Next in order is forty feet of red-and-yellow gravel. Then comes five feet of a blue-colored sandstone. Project-

FIG. 2.—Section of Bluff.

In Fig. 2, A is loam; B, yellow clay; C, yellow gravel; D, sandstone; E, red and yellow gravel; F, sandstone with wood lignite; G, coarse red gravel; H, very fine bluish gravel; I, indurated sand; J, gravel with iron cement; K, sandstone with lignite; L, beach; M, low water mark.

tiating from this layer are numerous stumps and other portions of trees partially transformed into lignite. Then there is fifty-five feet of very coarse red-and-yellow gravel, and immediately beneath it five feet of very fine blue-colored gravel. Under this is fifteen feet of indurated sand, covering a stratum of ten feet of gravel, stained a deep red, probably from the presence of oxide of iron. Beneath this is another stratum of sandstone, five feet, blue in color, with pieces of the lignite before referred to, projecting from it. Then five feet more of blue sandstone without any lignite. Then seven feet of gravelly beach to low-water mark.

The cliff described is at the lower end of the bluffs and near the mining works. The strata all dip to the north, at an angle of about 15 degrees; while that at the north end, although much broken, seems to dip towards the south. Mr. Chase presented specimens of stratum, No. 10, from the top, in which, on examination, mica and fine gold can be detected with a mi-

croscope. The specimen was a concretion, cemented together by the oxides of iron on a large boulder. Mr. Chase believes that it is from this stratum that the largest amount of fine gold is obtained.

In describing the method of working the mines, he says that he rode up the beach with the Superintendent of the lower claim, just as the tide was turning to go out. The practiced eye of the Superintendent of the claim noted every indication of the presence of black sand.

FIG. 3.—Black Sand Mine.

Alighting at a spot at the base of the cliff, he scraped away the loose gravel, and taking up a shovel-full of the sand lying beneath, he panned it out in the little pools of water left by the receding tide. On finding a "good prospect"

the first discoverers. So exceedingly fine, however, is the character of the gold that it requires a much larger quantity of these particles to make a cent in value than one not familiar with the subject would suppose. After the sand had been shoveled into little piles, the canvas sacks were taken from the mules and filled. With a word from the driver each mule walked up gravely between his sacks. On their being placed on his back he would start off on a trot for the works. The animals had to pass several points where the sea was breaking pretty well upon the bluff. When they saw a heavy breaker coming in, they would face the cliff like veterans with firmly braced feet and drooping ears, and allow the water to dash over them. When the swell receded they would start again on their way. During the time Mr. Chase was present these mules made three trips, carrying up over six tons during a single tide.

On arrival at the works the sand is placed in an enclosure called the "sand corral." A large lagoon near by supplies the water for separation. A small stationary engine and force pump is in use. The washing is done in "Long Toms" with copper plates. The plates are first coated with a layer of silver before the quicksilver is applied. During the week Mr. Chase was in the vicinity of the works they cleaned up a six or seven days' run and retorted \$1,000 from the washing of two machines. The succeeding week they cleaned up \$1,700. This yield comprised the gold from a portion at least of the rich deposit spoken of.

As the experience of the successive proprietors of this extraordinary gold mine goes to prove that immediately after a heavy cave or slide of the banks, the beaches are richer and its gold coarser, it seems strange that up to the present time no artificial means have been resorted to in the way of blasting down the cliffs or undermining them by hydraulic process to increase the yield of gold. The sea working ceaselessly night and day, is the great natural separator, and man has but to gather the results of its tireless work. Many ideas have been advanced as to the possibility of gold in quantities and coarser in character, being found beyond the line of surf. Predicated on the fact that it, in conjunction with black sand, has been said to have been brought up from the bottom by the leads of sailing vessels. Several expeditions have been fitted out from this port to procure this sand by means of diving apparatus, etc., but none of them were successful.

Two or three facts can be taken in conjunction to form an idea on this subject. The first is, that the gold evidently comes from the bluffs. This no one can doubt after once viewing them. The second, that after caves, the gold obtained is much coarser in character. The third, that it is only after a continued succession of swells that cut the beach at an angle, that the rich sands are found. When the surf breaks square on, let the storm be ever so heavy, it simply loads the beaches with gravel. The fourth, that no one witnessing the power of the surf, breaking as it does, with no rocky headlands, points or rocks to deaden it, can doubt that it must have an immense grinding force. From these facts Mr. Chase believes that the gold follows the first two or three lines of breakers, and will never be found in paying quantities beyond.

Mr. Chase sent to Prof. J. D. Dana specimens of the sands of Gold Bluff, and that gentleman, in speaking of the sands says: "The red grains in the sand are garnets. It is altogether probable that the deposit dates partly from the close of the glacial era; that is, the time of melting of the ice in the early part of the Champlain period when floods and gravel depositions were the order of the day, and partly from the later part of the Champlain period, when the floods were but partially abated, yet the depositions were more quiet.

The top gravel being stripped off, the underlying sand was gathered into little piles. While the men were thus engaged the Superintendent invited Mr. Chase's attention to the appearance of the bed-rock, which glittered with particles, and he could well believe the stories of

California Quicksilver.

The following is the quicksilver product of this State in 1871, 1872 and 1873, as computed by the *Commercial Herald*:

	1871.	1872.	1873.
FLASKS.	FLASKS.	FLASKS.	FLASKS.
New Almaden mine.....	13,783	17,763	12,000
New Idria mine.....	9,227	8,691	7,600
Redington mine.....	2,128	2,456	4,200
And sundry other mines...	1,763	1,500	4,800
Totals.....	31,881	30,806	28,600

The exports to the different countries for 1872, and the three previous years, were as follows:

To	1870.	1871.	1872.	1873.
New York.....	1,000	800	1,202	1,900
China.....	4,050	7,900	4,810	1,900
Mexico.....	7,088	3,081	6,038	3,761
South America.....	1,900	2,200	1,800	508
Australia.....	300	1,100	648	105
British Columbia.....	9	6	2	11
Other countries.....	41	118	103	74
Total flasks.....	13,788	15,205	13,098	6,359

And our exports previously have been:

	FLASKS.	FLASKS.
In 1869.....	24,415	9,448
In 1868.....	44,606	9,399
In 1867.....	28,859	24,142
In 1866.....	30,287	27,262
In 1865.....	42,469	23,740
In 1864.....	36,927	27,155
In 1863.....	26,014	20,963
In 1862.....	33,747	12,737
In 1861.....	35,996	900

During the year 1873 the market has presented many unexpected features. The price opened in January at 90c., was advanced in February to 92½c., in March to 95c., at which figure it stood on the first of April, 1873, at which date the combination expired which had for a long time kept under one control the entire product of the three largely producing mines, viz., the New Almaden, the New Idria and the Redington. The sales had for some time been sharply up with the total production, and there was at that date no surplus stock whatever on either the home or any foreign markets. The parties who owned the New Idria mine were also the parties who enjoyed the combination contracts for so long a period, and they were of course desirous of making fresh contracts for a new term, whereby they could continue to enjoy the profits of handling the product of all these mines on a commission basis. The Redington Company, however, refused to make any such arrangement, preferring to handle their own product and realizing that there was no longer the least need of any combination to protect them from competition in price, but that, on the contrary, every flask of quicksilver would be needed for local consumption quite as soon as produced.

Thus from the 1st of April, 1873, there has been no commotion whatever among the three large mines above mentioned, but the market has regulated itself by the laws of supply and demand, as is the case of any other commodity. The price continued 95c. lb. until June 24th, 1873, when it was raised to \$1.00, advancing in August to \$1.10 lb., and still again on the 18th of November, 1873, to \$1.20 lb. in gold, cash, at which figure it closes the year, with a demand for export considerably in excess of the ability of the market to supply. It is easy to see the causes which have led to this large advance, and impossible not to recognize their legitimacy. Briefly stated, the whole solution lies in the fact of the very large decline in the product of the New Almaden mine, which, in the years of its prime, used to produce fully 3,500 flasks per month, but which, during the year 1873, has not produced as much as 1,000 flasks per month, and, indeed, in the last half of the year, has not averaged, it is said, 750 flasks per month. In the meantime, the New Idria and the Redington have no more than held their own, and all the newly opened mines together have not made a total product to exceed an average of 400 flasks per month for the whole year. The deficit of the production of the New Almaden being thus 2,500 flasks per month, there having been substantially no gain of product from either the New Idria or the Redington, and only a total gain from all the new mines together of not over 400 flasks, the market has heretofore been at least 2,100 flasks per month short of its supply in previous years, a decline of over one-half in available stock. The first effect of this was to cut off all shipments to China and Mexico, and these markets, which have heretofore drawn from California as much as 20,000 flasks per year, were forced to send to London for their supplies, where they met with a market only moderately well stocked, and totally unable to supply so large a demand thus suddenly precipitated upon it.

The natural effect of such a large increase of demand in London was speedily followed and much aggravated by the internal commotion in Spain, where is situated the famous Almaden mine, the largest producer of quicksilver in the world, and, in point of fact, the only considerable source of supply out of California. This mine is controlled, under a thirty years' contract, by the Rothschilds, and though still undoubtedly rich in ore, is now so deep (having been worked upwards of 1,000 years), and is operated with so crude and primitive a system, under Government control and by convict labor, that it is believed not possible to increase its product materially, even in time of peace and tranquillity, while in the present period of internal commotion in Spain, it is at any moment liable to be stopped altogether. Such being the condition of matters, the London market has been a constantly advancing one, reaching in November, 1873, the enormous

price of £21 per flask, with none whatever left in first hands. It has now settled to £20 per flask, and it is not probable the price will vary from this, although it is by no means sure that the supply in first hands may not again entirely give out. At this price, it costs to lay down the quicksilver in New York, from London, at least \$1.45 gold lb. Such being the facts with reference to the supply of quicksilver; now, when we consider the demand for consumption, we find that such has been the development of mining industry on this coast that our mills now consume fully 50 per cent. more than they did two years ago, and it is today a fact that the local requirements of the Pacific States and Territories for mining purposes is so nearly equal to our total present production of quicksilver as to leave none whatever to spare for foreign export, and not to exceed 250 or 300 flasks per month available which can be spared for the New York demand. This last-named market calls for 500 or 600 flasks per month, and has, until within four months past, drawn fully two-thirds of its supply from London. This they will no longer do; for at £20 per flask in London, it costs, as before stated, \$1.45 gold to lay in New York. There being no probability of a decline in London, it follows that with this market at \$1.20, New York will draw her full supply hence, thus introducing a new element of competition for the already limited product, which must force the price up here to equal the London price, or result in a diversion from this market of some of the supply needed for local milling wants. More especially is this likely to be the case, for the reason that quite recent mining developments on the coast point most unmistakably to another quite considerable increase in the consumption requirements for the year 1874. Should New York thus draw on us, and should the milling requirements of the coast thus increase, we should need at least 1,000 flasks per month more than is now produced to meet the demand.

As to the probability of such increase supply, it would appear, from the best obtainable information, that the New Almaden does not promise to yield as much as last year, and may not safely be counted on to produce over 750 flasks per month. The New Idria promises no increase, and can not be estimated at over 750 flasks. The Redington mine, which has during the past year been unable to reduce all its ore, by reason of the partial giving out of its old furnace, has for the past six months been constructing two new furnaces, on the Knox & Osborne Patent plan; and will, in the course of January, 1874, place them in operation. They have been very carefully constructed, at large expense; and are claimed to be by far the best quicksilver reduction works yet constructed. When in operation they may be counted on to increase the yield of the Redington mine from 350 flasks per month—its yield for the past year—to say 600 flasks per month; and this may be counted on as a permanent increase, as they have already mined, and on the surface 10,000 tons of ore, and the daily out-put of the mine is fully equal to the capacity of the new furnaces. The Redington will thus make good the deficit over last year's production of the New Almaden, so that the three principal mines together will produce the same aggregate as they did last year. This would still leave an unfilled requirement of at least 1,000 flasks, on the consumption figures before given, and this can only be made up by new mines coming into production.

It will be strange, indeed, if among all the new localities now being worked there should not prove to be some permanent mines; still, it can not be overlooked that quicksilver mining has proved heretofore very delusive and uncertain, for during the years prior to 1873, scores of quicksilver locations were prospected and mines partially opened, but only the three before mentioned ever proved continuously productive, or in any considerable way productive to their owners. It is true that the present very high price offers great incentives and facilities to the development of new mines, but it cannot be overlooked that the development and proper equipment of a quicksilver mine, with suitable reduction works, costs a large sum of money, and parties going into the business without large capital may fail of success even on what might prove a reasonably good mine, were there sufficient capital in hand to work the mine through the doubtful stages which invariably attend cinnabar deposits, and thoroughly equip it with reduction works. It is to be hoped, nevertheless, that some of the new mines which are now claiming attention may prove permanently productive. Without some such aid, there will be an absolute and very considerable inadequacy of supply for local needs and a consequent still further enhancement of price.

RICH QUARTZ.—A gentleman residing out in Washington county brought to Mr. Fisk, the assayer, last week a small quantity of gold bearing quartz. On testing the rock, Mr. Fisk discovered that it contained a very large percentage of gold and silver. The rock assayed, averaged about \$1,700 per ton, which is regarded as a very rich yield. The person who brought the quartz in, refused to tell the precise locality from where the rock came. He said it was obtained about 150 miles from this city, and was found in the Cascade mountains.

IMMIGRANTS swelled our population by 70,162 last year. 25,792 arrived by sea, and 44,370 overland. 18,000 of the arrivals were Chinese.

Railroad Engineering in the Andes.

ENGINEER'S CAMP, RIO HUALLATA,
AREQUIPA & PUNO RAILROAD.
PERU, October 15, 1871.

DEAR SIR: I obtained employment immediately on my arrival in this country, and commenced operations as resident engineer of the Arequipa section of the Arequipa and Puno road. Close to the town a bridge, 1,500 feet in length, was being built where the line crosses the Rio Chile. Attending to the foundations, etc., of this bridge was about all I had to do for some two months. The height of the bridge above the bed of the stream is 60 feet; span across the river, 125 feet; the rest in spans of 30 feet. A temporary wooden trestle bridge has been put up. The bridge finally will be of iron. Style, plain girder and brace; built by the Baltimore Bridge Company.

As soon as the temporary bridge was completed, I was sent up here as division engineer to locate the "middle" or "summit division" of the line, nearly eighty miles in length. We have got through with the worst part of the work, and I think in another month will have all the field work done. We commenced at an elevation of 13,400 feet. Our grade line yesterday evening was 14,510 feet, and the greatest elevation on the division and on the line will be about 14,600 feet above the sea level.

This is one of the roads being built by Mr. Meiggs under contract with the Peruvian Government, and is considered to be at present the road of the country. It will terminate at Puno, on the shore of Lake Titicaca, on the eastern slope of the Cordillera. Distance from Arequipa to Puno, 220 miles. Arequipa being already connected with the coast by a road, completed and in operation, 100 miles long. The style of the road is 4 ft. 8 in. gauge; 14 ft. road-bed; rails about 70 lbs. to the yard; fish-plate joint; sleepers, two feet in the clear; engines, 6-wheeled (Rogers manufacture), weight from 35 to 40 tons.

Our limits for location are 4 per cent. grade (211 feet per mile) and 6-degree curves. [He afterwards speaks of 16-degree curves.] The grades here are counted by so much per cent. or rise in a hundred feet. With these limits, the country is so rough that we have some very heavy work. The First Division has the heaviest work, where the cuts and fills of 100 feet and over are of no uncommon occurrence. One fill alone was 175,000 cubic yards. I saw a place on the Lima and Arroyo road where, according to the located line, there was to be a fill of 225 feet. So far, our heaviest work is from 35 to 40 feet; but we changed the line from the preliminary in one place, and escaped two fills that were estimated at half a million yards. Sixteen-degree curves looked very sharp when I first commenced locating, but I have got used to them now.

Up to the present date I am not very favorably impressed with the country. I have not yet been to Puno, and don't know what the resources of that part of the country may be; but a more desolate, barren waste than that through which we are now locating could scarcely be conceived, and the climate is the worst I ever experienced. The nights are extremely cold, and during the day we have a wind that cuts the skin off your nose, lips and cheeks as effectively as if it had been done with a keen razor. My face got so bad at one time that I had to go to Arequipa and stay there several days to give it a chance to heal up. This only applies to the extreme elevations where we are now. In Arequipa and nearer the coast the climate resembles very much some parts of California. —*Railroad Gazette.*

From Troy.

The latest news from the mines of the Troy mining company is most favorable. The first connection ever made underground was made on Christmas day, when the two shafts in the main tunnel were connected by a drift, at a depth of seventy-seven feet below the tunnel, exposing a solid breast pay ore one hundred feet in width, assaying in value up to \$230 per ton, and running from the tunnel to the bottom of the shafts. The main tunnel is now in eight hundred feet, and will strike the ledge three hundred feet from the surface. The smaller tunnel is in two hundred feet in a different direction, and will strike the ledge about one hundred feet from the surface. From fifty to sixty men are working steadily, and take out about twenty-two tons of pay ore per day. It is confidently expected that when these tunnels strike the ledge, which will be in a very short time, a large and valuable mine will be exposed.

Capt. Roberts has made a great success in separating the silver from the copper—both silver and copper bars being turned out of their works for shipment—the silver bars being 800 fine. The entire management of this fine property, since coming under the control of Mr. Edward Davis, a gentleman of thirty years experience in mining, has been most successful, and the assistance of our old friend and former resident of this place, Capt. J. C. Edwards, who for the past eight months has had charge of the working of the mines under Mr. Davis, the developments already made, and future prospects of the mining interests of the company, could not be more favorable, the ledge now being, where exposed, from seventeen to twenty feet in width, and with every appearance of a true fissure vein. —*News.*

Dry Crushing and Dry Concentration of Ores.

The Salt Lake Tribune, of Jan. 9th, says:—Yesterday quite a number of gentlemen who are interested in Utah mining, paid a visit to the Concentration Works being erected by J. R. Nichols, of this city, about one mile north of the U. C. R. R. The building is located in the 19th Ward, and is built of brick, 60x80 feet, five stories, with the basement, eleven feet in the clear. The main floor fifteen feet; second story, fifteen feet; third, eighteen feet; fourth, or attic, nine feet in the clear, and eighteen feet, to the peak. Each floor is 60x80 feet, except the fifth or attic, which is 36x80 feet, and the whole building is the most solid and substantial in Utah.

Last May and June, the Tribune gave a full description of the operation of the Krom dry concentrating mill at Dry Cañon, Nevada, which, in brief, was that the ore of that district, treated by water jiggers, stamp mill and blankets, all combined, resulted in a loss of 75 per cent. of the assay value of the ore, and that results by the Krom concentrating process over 90 per cent. was saved.

Accompanying the party who visited Mr. Nichols' works, was Mr. J. P. Lawson of San Francisco, who, during the past year, has been operating in mining at Wallapai, Arizona, but the ores being low grade and complicated, he was sent by the company he represented to Star City, in October last, to examine the Krom Dry Concentration. Mr. Lawson says that they work perfectly satisfactory, saving 95 to 97 per cent. of the assay value of the ore and all the dust is saved, (assaying \$150 to \$400 per ton,) and the mill kept clean and free from dust. The crushing rolls, up to October, had crushed 8,000 tons of ore of a very hard quartz, yet the wear upon the rolls was barely perceptible.

Mr. Lawson says the Krom process and machinery is the only thing he has seen that will practically and economically treat the great bulk of ore in Utah, Nevada, Montana and Idaho.

We learn that Mr. Nichols expects to have his Concentration Works completed and in running order by the first of April next. He has machinery for fifty tons per day capacity ready to set up, but his building will have a capacity for holding five hundred tons per day; and additional machinery will be added as fast as required.

This will greatly encourage the miners of Utah, as such works will create a market for the low grade rebellious ores, however complicated, rebellious or refractory, as his tests and experiences during the past three years have demonstrated that he can successfully handle any of them.

French Guiana Mines.

The Salt Lake Tribune publishes some extracts from a letter, received by a gentleman in this city, from a friend now in French Guiana. The writer was a former resident of Utah, and his statements are considered in every respect reliable. The letter was written the latter part of October, and gives no very encouraging account of the gold mines in that country.

"This is a penal colony, under French rule, and Cayenne City is the principal place. French only is spoken, except back in the country, where the language is a mixture of French and the native tongue. Some mines, about thirty miles back of Cayenne, are owned by a French company, which, after an outlay of \$180,000, are working its claims with hydraulics and other improvements, and make clean nps every three months, counting the result by pounds. This looks large, but is no more than many claims, now worked in California, are doing.

"Outside of this, there are companies working claims by hand, that is by sluicing, rocking, etc. They average about \$2.50 a day to the man. One party of my acquaintance, who has been up in the country since last June, has not made expenses up to this time, yet hopes that better ground may be found by going inland.

"On arriving at Cayenne, every one must undergo a close inspection and examination as to their intentions. After much delay, they get a permit by paying \$50 in coin, to go inland and prospect. This takes from six weeks to two months, and the prospector then must return to Cayenne, and upon the payment of \$300 more in coin to the proper officials, a surveyor with a squad of cavalry is sent out, to lay out the location, paying all expenses, when the miner must again return to Cayenne and get the papers and permit to work the ground. Until all this delay and expense is gone through with, no man can work a foot of ground. Now, after packing your tools from thirty to seventy miles, and perhaps months of labor to open your ground and find water to work with, your claim pays you only \$3 a day, as this is the average yield. It will cost at the lowest estimate \$750 coin to reach this country and get a title to ground. The climate is sickly, as the rate of mortality in the French army and among the convicts proves. There may be paying mines further inland, but until they are found, I would not advise any one to come out here, unless they have at least \$2,000, which they wish to expend in taking chances, which are not as good at present as in many camps to be found in the United States."

MECHANICAL PROGRESS.

Steam Carriages for Common Roads.

It appears that at present an exceptional degree of attention is being given both in England and America to the use of steam as a motor on highways. For agricultural purposes the use of this power has already become a fixed fact in the successful introduction of steam ploughs, and of steam reaping and mowing machines, as well as of threshing machines capable of being moved from farm to farm by their own steam power. To military uses steam is already applied on the Continent and in England with substantial success. During the late Franco-Prussian war road locomotives were employed by the Germans to some considerable extent, and the early capitulation of Metz prevented a very interesting test of their value on a road constructed by the besieging army skirting the fortifications of that city. In England the late rapid success in the number of road locomotives for the transportation of goods has claimed the special attention of Parliament, and the result of the deliberations of a committee appointed to inquire to the effect of steam traffic on common roads appears in an exhaustive report, printed in August last. In an able and interesting paper read before the Polytechnic Club of the American Institute in November of last year, Prof. R. H. Thurston gives the results of various trials of Messrs. Aveling and Porters' locomotive road rollers at Orange, N. J., and also a sketch of the "Past, Present and Future of Steam on the Common Road." The result of his experiments is embraced in the following abstract: "The expense account when doing heavy work on the common road, under the described conditions by steam power, is therefore less than 25 per centum of the average cost of horse power as deduced from the total expenses of such power in New York State, while if we take for comparison the lowest estimate that we can find data for in our whole country, we still find the cost of steam power to be but 29 per centum of the expense of horses. We may state the fact in another way: a steam traction engine capable of doing the work of 25 horses, may be worked at as little expense as a team of six or eight horses."

When we add to this view of the economy of steam power, the fact also set forth by Prof. Thurston that "the working time of the traction engine may therefore be stated to be ordinarily 20 per centum greater than that of the dry horse and to be capable of indefinite extension when required," it is not unsafe to predict in this country as in England the speedy substitution, at least in a great measure, of steam for animal power in the transportation of goods. The discussion of the use of road locomotives for passenger traffic is more of a mooted question. As a matter of course the same principles of economy argue in its favor. But on the other hand special causes combine against it other than the general oppositions to steam locomotion on common roads.

The causes which oppose the road locomotive are now being closely examined as to their foundation in fact or in fancy. They are various, but are chiefly comprehended in the supposed danger to horses and carriages, the alleged injury to roads and bridges, the opposition of special interests and adverse legislation. The first objection is now nearly exploded. It has been found that the introduction of steam on street railroads, so far as it has been tried, has resulted in very trifling inconvenience to owners of horses. In the main, horses soon become accustomed to steam machinery, although there are, of course, some that will always be frightened by this as by other objects. Any danger to carriages by collision can be, and in England is, readily obviated by proper laws enacting due care from the persons in charge of the road locomotive. As concerns roads and bridges, it is undoubtedly true that the general introduction of steam traffic thereon would necessitate the construction of tolerably good roads. It is not pretended that in some sections of the country it would not be inexpedient, and perhaps impossible to fit the common roads for steam motors. But such instances are exceptional. Generally the highways might be adapted thereto without increased expense over the amount in most cases now imperatively demanded by the necessity of better causeways for existing means of motion, and it is found in England that the constant wear of locomotives on properly constructed highways tends to make them better, the broad wheels and heavy weight of traction engines constantly operating as rollers to make a smooth, fine road bed. In the parliamentary committee's report above referred to, the use of road locomotives is commended for this very reason. As to bridges, the weight of the road locomotive does not give a greater strain than a well-built bridge should sustain with safety, the weight of a light steam carriage ranging from three to seven tons when loaded and that of a heavy traction engine from nine to fourteen tons.

In this country very little has so far been done to facilitate the introduction of steam motors. Sufficient experiment, has, however, been made to prove their availability, not merely on level ground, but also on the ordinary country road. It is, therefore, not only in vast level regions of the West and South, which Prof. Thurston considers "the natural

habitat of this motor," but throughout the entire country, that the demands of the public will soon necessitate the practical consideration of this subject, and probably open to American manufacturing enterprises a new and wide field of industry. The design of this article is mainly to suggest that fact.—*American Manufacturer.*

Cast Steel Railway Axles.

A writer in the *Annuaire*, a French periodical, strongly advocates the use of cast steel axles, on the ground that, when it is of good quality, such material will safely stand twice the strain of wrought iron, and its bending and breaking moments will be in the same proportion. Calculating from these data, he says that the diameter of a steel axle compared with that of a wrought iron one, will be as four to five, and it weighs only five-eighths of that of the other. Another advantage enumerated of employing this material, is that the diameter of the journal may be diminished in the ratio of 0.706; and a steel journal will also bear a greater pressure per square inch of surface, without heating, than one of iron. The result of using a smaller sized journal is to diminish the haulage, which in every vehicle varies directly as the proportion between the diameter of the journals and that of the wheels. The weight of a steel journal is about three-quarters that of an iron one. By the adoption of steel axles there is also no necessity for making the wheel bed, and consequently the nave of the wheel so long. The length of this part of the axle has not much influence upon the strength of it, provided the diameter be increased slightly in excess of that immediately behind it, and that the junction between the wheel and the axle be thoroughly well secured. The fixing of the wheel on the axle has, also, a very considerable influence upon the strains. If the nave be short, and no keys be used in connection, the tension must be proportionately great per square inch of surface of contact. Again, the "grinding" of the flanges of the wheels occasions a particular pressure on this part of the axle, and tends to shear it with a force inversely as the length of the bearing, but this may be mitigated by rounding the exterior edges of the nave of the wheels.

Bracket Chairs.

At a meeting of the members of the Institution of Mechanical Engineers, at Birmingham, England, a paper was read by Mr. Sheriff, on a "Description of the Bracket Chairs for suspending Double-headed Rails," in which he said that these chairs are each made in two separate halves, fixed one on each side of the rail, the bearing of which is on the under side of the upper head; and there is no portion of the chair underneath the bottom of the rail, which is suspended by the head, with the bottom just clear of the sleeper. When turned over, therefore, after the top face has been worn out, the bottom head of the rail presents a perfect face, altogether free from the injury that occurs in the ordinary chairs, in which the bottom face of the rail becomes more or less indented by bearing on the bottom of the chair. The two halves of the chair are secured together by a bolt passing through the rail, which is fixed to the sleeper by screwed spikes. On one side the spike passes through a slot in the chair, to allow that half the chair to slide inwards when the spike is slackened, for removing or turning the rail; the slot is blocked by a washer, which fits in a recess at the end of the slot, and is kept down by the spike head. The chair, of which a specimen is exhibited, is believed to have been designed by Mr. Brunel in 1853, and introduced by him on lines in South Wales; it was afterwards adopted on the West Cornwall Railway, where it has now been in use for eleven years with complete success. In no case has the lower head of the rails when turned over been found to be injured; and the result has been thoroughly satisfactory as regards durability, safety and economy of maintenance; there is an important saving in first cost, the bracket chairs being less than half the weight of the ordinary chairs. The construction is also free from the risk of a rail getting displaced by the loss or slackness of a key; and also from liability to fracture of the chair in driving the wood keys used with the ordinary chairs.

Tin or block plates are now being manufactured in England by a new process, consisting in the preparation of the iron used in their manufacture. A number of refining furnaces are employed, into the first of which the pig or cast iron is submitted to the melting process, and from thence run into other "lumping" refineries. Instead of using charcoal, as is commonly the case, the fires are fed with tan. This process has proved very satisfactory, and is meeting with popular favor by those engaged in this branch of industry.

NOTHING NEW UNDER THE SUN.—In the museum of the United Service Club, in London, specimen No. 1,160 is worthy of attention. It is a pistol, which history authentically proves is two hundred years old. If we except the lock, this pistol is almost a counterpart of our improved Colt's revolver. The chambers, even in number, are brought under the hammer by the action of the trigger. It has but one barrel, and, of course, six of the chambers are always open, and can be charged at once.

SCIENTIFIC PROGRESS.

Analysis of Galena.

Storer's process consists in decomposing galena hydrochloric acid in contact with zinc, sulphuretted hydrogen being evolved and metallic lead separated. The action of the zinc consists simply in decomposing the chloride of lead formed, and preventing the hydrochloric acid from becoming saturated with this salt.

Lead is generally included among those metals whose sulphides, as precipitated by sulphuretted hydrogen, are insoluble in acid liquids; this is incorrect. Recently precipitated and washed sulphide of lead is immediately, even in the cold, converted into chloride of lead with evolution of sulphuretted hydrogen. It is well known that lead cannot be detected by sulphuretted hydrogen in presence of excess of sulphuric or hydrochloric acid.

Galena, even in mixed ores, can be completely extracted by hydrochloric acid, and the lead thrown down from the solution. Copper pyrites does not yield a trace of copper to boiling hydrochloric acid, but merely a small quantity of iron. Zinc, iron, and manganese, even if present, are not precipitated by zinc from an acid solution. It is possible to dissolve and throw down the lead alone; Storer's condition that no other heavy metal be present, is not essential, with the possible exception of antimony. Lead is most accurately determined as sulphate. The process is the following, whatever other metals are present in the ore with the exception of antimony:—the galena is finely pulverized; two grammes are weighed off, placed in a small porcelain pan provided with a handle. It is dripped with hydrochloric acid covered with a convex glass, heated till sulphuretted hydrogen is evolved and lastly boiled. A large quantity of chloride of lead separates. When the hydrochloric acid is saturated with chloride of lead, zinc is added in the form of a small ball. Brisk evolution of hydrogen sets in and the lead is deposited upon the zinc. By the application of a gentle heat fresh quantities of chloride of lead are dissolved and decomposed, until the liquid is clear and colorless, and no more sulphuretted hydrogen is evolved. The liquid is decanted off, and the metallic lead completely washed with pure water in the original vessel. The density of the lead makes this process safe and easy. Dilute nitric acid is poured upon the lead while still moist, and heat is applied till all is dissolved. Nitrate of lead crystallizes out, if there is not a sufficiency of water. This nitrate of lead is dissolved in boiling water, filtered, and the filter is washed with hot water. The lead in the filtrate is precipitated by means of pure sulphuric acid in large excess, and heated for some time, to let the precipitate settle in a dense form. When cold it is filtered, washed with dilute sulphuric acid, and afterwards with a little alcohol, dried and weighed after incinerating the filter. The filtrate, on saturation with ammonia and sulphuretted hydrogen, gives scarcely a trace of brown coloration. The filter is freed from the precipitate and burnt alone; then the main mass of the precipitate is introduced into the crucible, and heated not quite to redness.

It was observed that the oxalate of lead is practically insoluble in pure water, and perfectly so in free oxalic acid. Neutral chromate of potash and phosphate of soda are both more sensitive reagents for lead than sulphuretted hydrogen. Attempts were made to dispense with the precipitation with zinc, and decompose the chloride of lead directly by means of sulphuric or oxalic acid. No good results were obtained.—*Iron.*

New Mode of Liquefying Gases.

By the application of cold and pressure in suitably contrived machines, all of the gases with the exception of six, nitrogen, hydrogen, oxygen, marsh gas, carbonic oxide and nitric oxide, have been reduced to a liquid condition. This liquefaction was first performed by Faraday and served to prove the fact that gases and vapors are not distinct in their nature. It may be remembered that the simple apparatus used during these initial experiments consisted of a bent glass tube, having a long and a short leg at right angles. Into the open end of the longer portion was placed a substance from which gas could be obtained by heat, after which the tube was hermetically sealed. The shorter limb was then plunged into a freezing mixture, and heat applied to the larger portion, generating large quantities of gas, upon which, being confined in a small compass, the pressure gradually increased, finally condensing the same into liquid form in the smaller receptacle. The facts thus recalled will indicate the importance of a recent experiment made by M. Melsens, a celebrated chemist of Brussels, who, it is stated, has lately succeeded in obtaining wood charcoal in an absolutely pure state. So great is the absorbent power of this substance that it will concentrate in its pores a quantity of gas equal to its own weight. This has been used by Melsens in an apparatus similar to that of Faraday above described; and through its agency, he has succeeded in liquefying gases with great readiness. The charcoal, it seems, is placed in the long leg and allowed to absorb as much gas as possible. The tube is then sealed and enclosed in a tin pipe heated to 212° by a current of steam.

The gas in the charcoal is thus disengaged and caused to compress itself into the short limb, passing almost immediately into a liquid state. It is stated that from one to one and a half cubic inches of liquefied gas can be quickly obtained.—*Sci. Am.*

Solar Light and Heat.

In a recent lecture on the Sun, delivered in Boston, Mr. R. A. Proctor said: "We will next consider the sun's light. This we may compare with the oxy-hydrogen light, which has but 1-146 of its intensity, or with the electric light, which is but one-third as intense. The heat radiated by the sun is also comparable. The estimates of its total heat are very variable, but that which it furnishes to the earth we are able to measure, and to arrive at exact results. Sir John Herschel has found that the heat which falls upon one square mile, when the sun is in the zenith, is capable of melting in one hour 26,000 tons of ice. There are 50,000,000 square miles on the surface which the sun shines upon, and the heat which it receives would be sufficient to raise an ocean sixty-six miles deep in one year from the freezing to the boiling point. That received by the earth is but a small part of the light emitted, for 57,000 earths could be placed in the earth's orbit. The planets receive only the 227-millionth part of it. What then becomes of the rest? The stars, which are also suns, are giving out a large amount of heat, only a portion of which falls upon their planets. What becomes of all this heat which is radiated into space? That is a question which is yet unanswered. But to return to the sun. The heat which is actually given out by one square yard is estimated to be equal to that evolved by six tons of coal burnt in one hour. The light and heat of the sun travel at the same rate, and probably the magnetic power also. Yet it takes eight minutes for it to pass the space between us. If the sun gives out sound, and it undoubtedly does give out sound, it would take thirteen and one-half years to bring it to us. But there is, strangely enough, a gap which it can not pass. If those old heathen, who prayed to the sun, could have known how many years would have elapsed before their petitions would have been heard, if it was possible for the sound to have passed that gap, they might have desisted from their devotions. If a rod of metal were connected between the earth and sun, it would take three hundred days for a sound to be transmitted from one to the other. There was a very nice illustration of the distance between us which had been given by an American whom he did not know, but which is based upon the rapidity with which a sensation is transmitted in the body. He said if a baby at its birth had an arm so long that it could touch the sun, that even if it lived to threescore years and ten, it never would know that its fingers were burnt."

Dr. Marcy, says *Les Mondes*, has recently demonstrated that the heart acts like all mechanical motors in that the frequency of the pulsations varies according to the resistance which it meets in driving the blood through the vessels. When the resistance becomes greater, the throbs diminish; they accelerate, on the contrary, if the opposition becomes less. During life, the action of the nervous centers makes itself felt on the heart, of which it renders the pulsations slower or quicker, whatever may be the resistance experienced. Dr. Marcy eliminated this nervous influence by removing the heart of an animal, and causing it to work under purely mechanical conditions. The heart of a turtle was arranged with a system of rubber tubes representing veins and arteries. Calf's blood, defibrinated was caused to circulate, and a registering instrument noted the amplitude and frequency of the movements of the organ. When the tube containing the blood leaving the heart was compressed, the liquid accumulated in the rear of the obstacle and the heart emptied itself with greater difficulty, the pulsations weakening perceptibly. On relaxing the pressure, thus allowing free course to the blood, the throbs accelerated rapidly.

NEW PHOTOMETER.—A simple arrangement, which may be exceedingly useful for many purposes, has been devised by M. Yvon. A piece of paper or card is folded in the middle, and placed upright on a table in such a manner that the two halves form right angles. In the line bisecting the angle thus formed, and at some little distance from its apex, is placed a tube, blackened in the interior, through which the observer looks at the edge of the paper or card. The sources of illumination to be compared are placed at opposite sides of the card. So long as the two surfaces are unequally illuminated, the observer has a perception of relief; when, however, the light is perfectly equalized, he sees what appears to be a plane surface.—*Iron.*

PREVIOUS to the Franco-Prussian war, the St. Laurent, of the French line, was fitted with electric lights of great power, which were plainly discernible for many miles at sea. At the beginning of the war this light was taken from the steamer and used by the Government for harbor defence, and has not since been used at sea. The managers of the French line are now considering the propriety of providing all their ships with lights of this description, which would, except under circumstances most unusual, render a collision impossible. The substitution of life-boats for life-boats is also under consideration.

ledge has been opened on top for a distance of 200 ft., and varies from 1 to 8 ft. from the surface; is about one ft. in thickness, and is very rich in the whole length, and the deeper it goes down upon the richer it grows. A run is now being made of some 60 or 70 tons of this ore, at the old Shepherd & Witsen mill, a good road having been graded from this mine to this mill, which is only about a quarter of a mile distant, and a clean up will be made next Saturday, which we believe, will show a greater production from this time work was commenced upon the mine—about six weeks—than anything heretofore experienced in the State. We saw rock, lots of it, taken from different localities in the ledge, that would go one dollar to the pound, and several selections were made that actually went from \$2.50 to \$3.00 to the pound.

MINE generally throughout the State are complaining of a scarcity of water. There is a big supply in the mountains, in the shape of snow, which they will get soon, but a few days' steady rain just now would be worth untold thousands to them.

INYO COUNTY.

FURNACE FOR SYLVANIA.—Inyo Independent, Jan. 10th: Samuel Halsey and Thomas Coates, of Gold Mountain, have made a conditional sale of their interest in the famous Oriental mine of that district to the Manhattan company, and propose to turn their attention to Sylvania, where they have some valuable interests. They design to erect a furnace there if things progress favorably.

KERN COUNTY.

VENTURA MINE.—*Miner*, Jan. 10: Work has been commenced on this mine, situated in Hot Spring Valley, by the company lately incorporated in San Francisco, in good earnest, and we shall look for developments soon, which will give an impetus to prospecting and mining in our region. The Ventura lode is a continuation of the famous Big Blue, and its owners here are Messrs. E. R. Borke, H. D. Bequette and T. A. Stontenburgh.

STOCK TAKEN.—Articles of incorporation of the Havilah Mining Tunnel have been drawn up. Considerable enterprise in the project has been shown already, and the majority of the twenty-five thousand shares have been taken by parties in the county.

A rich silver strike was made in the St. John mine last Wednesday. It is estimated to go \$1,000 per ton.

NAPA COUNTY.

WASHINGTON.—*Register*, Jan. 17: Monday the annual meeting of shareholders in the Pope Valley mine took place, and the following officers of the company were re-elected, viz: President, W. W. Stillwagon; Secretary, E. N. Boynton; Treasurer, A. Y. Easterly; Trustees, Jacob Ellsbury and Daniel Patten. Though this company's furnaces are stopped for repairs, still work in the mine is being vigorously prosecuted, and they already have between 8,000 and 9,000 tons of ore at the surface, ready to commence work with in the spring.

THE ETNA MINE.—The shareholders of this quicksilver mine, which is situated in Pope Valley, are jubilant over the fact of running out nineteen flasks of quicksilver from their retorts in a six days' run. They have plenty of fine-looking ore out, and, having repaired their furnace, expect to do a heavy amount of reducing this winter. The mine is now under the able superintendence of Mr. Peel, who is a practical miner, and a man of good, sound judgment in regard to operating quicksilver mines.

THE REED MINE.—This mine is at present employing quite a large number of hands, in proof of which is the fact that it required an extra coach to be put on the Knoxville line, by Scribner. Both stages were loaded down with men, blankets and carpet-sacks.

NEVADA COUNTY.

SPECIMENS ON THE STREETS.—*Union*, Jan. 18th: Main street is being macadamized with stone hauled from the dump piles around the quartz mills. A careful search of the stone put upon the street shows that in it are many pieces of quartz which show gold. Yesterday several good specimens were found. Dan Holbrook captured a nice little showing, Charley Stoeke got several pieces which show gold, and General Wholer found a fine specimen. In the afternoon of yesterday several small boys were using hammers in breaking up rock and looking for gold. Stokes is going to send his find to the Marysville Appeal, in order to show the people of his old home that he now lives in a New Jerusalem—the streets of which are paved with gold. We are afraid that some enterprising mill man will locate the stone pavement, on Main street, and will insist on crushing the same.

KENTUCKY.—*Foot-Hill Tidings*, Jan. 17: Work at this mine is progressing. On the 100-ft. level they have a 2-ft. vein of promising ore; below that level, though, work is suspended, there being too much water. We are informed that it is the intention of this company to make a trial of the Peier & Lundquist concentrator in connection with their new mill.

NEW YORK HILL.—A rich vein of ore was reached in this mine on Thursday evening. We have seen several fine specimens—literally plastered with gold—which were brought in after nightfall by Schneider, the foreman, who says there are many indications of a continuance of the rich vein. "Old Block" is in luck.

MAGENTA MINE.—The second level in the Magenta is making an excellent showing. The ledge is from 2½ to 3 feet thick, at the least, and is heavily charged with mineral. The sulphurets are very heavy and of the best kind.

Very little free gold can be seen in this rock as taken out of this mine. When the rock is burned, however, the gold manifests itself to the naked eyes in great quantity. Another crushing will soon be had, if the weather will permit hauling from the mine to the mill. Some of our experienced amalgamators, who have seen this ore from the Magenta's second level, say that it will require great care to save the gold in the ore by any of the appliances now used in this mills heretofore. A mill process trial will, nevertheless, be made and the sulphurets be saved for chlorination working afterward. Big results are sure.

SEVERAL ACCIDENT AT THE EMPIRE.—Yesterday morning, about 7 o'clock, a serious accident occurred at the Empire mine. In the mine a shaft was sinking from above and raising from below. Men were engaged in both works. They came closer together in the work than was suspected. The men who were sinking put in a blast and exploded it. The blast went through and reached the man who was below and engaged in raising the shaft. The proper warning was given, as we understand, but the man below thought the blast would not go through the intervening ground. The result was that Thos. E. Hooper, engaged in the raising part of the work, was seriously injured.

Dr. Manson was summoned to the case, and Dr. McCormick was also called. They agree that the wound is a serious one, and that Hooper may die of his injuries. At the last accounts yesterday evening Hooper had somewhat rallied.

SAN BERNARDINO COUNTY.

RICH.—*Argus*, Jan. 8: Quite an excitement was created on Third street on Tuesday evening by the test of a small quantity of Blue Jay ore, the ore which weighed 2½ ounces was washed and yielded a little over 80 cents. We do not believe that this showing has ever been excelled by any undeveloped claim in California.

SAN DIEGO COUNTY.

STONEWALL MINE.—*World*, Jan. 15: Col. Frary, of Frary & Shultz, and of the Stonewall mine, is in town. The Colonel reports the Stonewall to be in capital condition. He has all the water he will need for his mill for a year. The mine is surpassing its previous record, and turning out bullion at the rate of \$7,000 per month. It is proving itself a fortune to its owners.

SIERRA COUNTY.

EMPIRE GRAVEL MINE.—*Messenger*, Jan. 17: The proprietors of this mine, through the exertions of their efficient superintendent, J. Deacon, have opened one of the richest gravel deposits in the State.

TRINITY COUNTY.

RICH.—*Journal*, Jan. 17: Carson & Goering have struck into the old Sydney Gulch channel, back of town, and are now getting prospects of from fifty cents to one dollar to the shovel-full.

TUOLUMNE COUNTY.

MINERS' STRIKE.—*Democrat*, Jan. 17: The miners employed in the Blue Gravel claim, in Table Mountain, quit work on Thursday, in consequence of the company requiring the hours of labor to be increased from nine to ten. The works will be idle until the old hands, or a new set, are willing to work ten hours. Quite extensive improvements are being put on this claim, in the shape of mills, etc.

Nevada.

RICHMOND BULLION.—*Sentinel*, Jan. 15: There is an immense stock of bars piled up at the Richmond works. We have heard no estimate, but at a rough guess would lay the amount at something near two hundred tons.

FURNACES IN OPERATION.—There are at present seven furnaces in operation in the district. This time last year only one or two were in full blast.

PEAVINE DISTRICT.

POB.—*Cor. Reno Crescent*: The Poe company have had some ore worked at the English mill, and I am informed that the result was entirely satisfactory. A shaft is being sunk for a new level, and if improvement continues as it has commenced in the first ten feet, the mine will be truly a great one.

THE NEVADA MINE.—The sensation of the week has been the discovery of the Paymaster ledge in the tunnel of the Nevada company, located east of the Hopkins claim and about 100 feet south from the Paymaster mine. Within 12 feet from the face of the tunnel the top of the chimney of the ledge was cut; a shaft was started and is now down 20 feet showing a ledge 3½ feet wide, much decomposed and broken up as yet, having all of the characteristics of the ledge in the original mine. There is no one here who doubts its being the Paymaster ledge. The lucky owners of this mine are D. C. Martin, Felix O'Neil, W. H. Dickens and D. P. Carr, each one-fourth. There are but 880 feet in this mine, that being the distance between the south line of the Paymaster and north line of the Carr Tunnel Right.

THE BUCKEYE AND TOMPKINS are both lying idle, as is also the entire line of the Poe ledge. BENNETT & FREE are still driving ahead their tunnel for the Cable ledge.

THE STEWELL 2d NORTH PAYMASTER is located upon the line of the ledge as surveyed by Mr. Carr, and the company are now sinking a shaft to cut their ledge.

THE CARR TUNNEL.—The work in this tunnel has been continued vigorously for the past week, day and night. The Paymaster ledge is

still to the east of the drift, from the main tunnel (now in 70 ft.), but should be cut by it, if the ledge keeps its true course.

NEW CLAIMS.—The Sacramento, east of the Poe, shows some fine rock, assays from which prove it to be rich. The Golden Rose, Treasures Hill, Lottie Ellis and Chronicles ledges are claimed to have merit, but I have not seen enough of them to give any description.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill News, Jan. 17th: The product of this mine is about 200 tons daily, all from the 1,200-foot level. The ore breasts on this level and also the raise in the ore body above this level are yielding fine ore. The raise from the 1,200-foot level has now reached the 1,000-foot level and continues in good ore, the width of which at that point is yet unknown. The south drift from the shaft on the 1,000-foot level has reached the ore body and connected with the raise from the 1,200. A crosscut is now making to determine the width of the ore body at that point. At a depth of 100 feet below the 1,200-foot level in the winze sunk in the ore body, crosscuts are also now being run to the east and west. The east crosscut is in 30 feet and the west crosscut 46 feet from the winze and both drift in good ore. On the 1,300-foot level the drift running south from the shaft to connect with the winze is now advanced 140 feet. The north drift has reached the southern boundary of the California Mining Company. This drift will be continued northward through the latter mine. Sinking the main shaft is continued below the 1,300-foot or lowest level. The future of this mine looks exceedingly bright.

OPHIR.—Work upon the main south drifts and cross-outs on the 1,300 and 1,465-ft. levels has been discontinued for the present. The ore body on the 1,300-ft. level, as far as prospected, shows a width of 20 ft., and is of good quality. On the 1,465-ft. level the prospecting already done proves the ore to be 100 ft. in width, and of higher grade. Two winzes are to be immediately sunk—one in the ore body from the 1,300 to the 1,465-ft. level, and the other in the ore body extending from the 1,465 toward the 1,700-ft. level. A donkey engine has been placed at the head of the main incline on the 1,465-ft. level to do the necessary hoisting from the 1,700-ft. level up to the 1,465, which will greatly facilitate the work in that part of the mine. Driving the main south drift on the 1,700-ft. level is making steady progress, with nothing new to report.

BEUCHER.—The main incline is down 68 ft. below the 1,400-ft. level, still in hard blasting ground. The 1,400-ft. station has been opened and a drift which is in 39 ft., started to the northward to connect with the main south drift on the 1,400-ft. level from the Crown Point. All ore taken from the 1,300-ft. level is now being hoisted through the company's own shaft, doing away entirely with hoisting formerly done through the Yellow Jacket shaft. The south winze on the 1,300-ft. level is down 54 ft. All the ore stopes throughout the mine are looking well and yielding finely. Daily yield 500 tons. Mills are all running up to their full capacity and prospects look flattering.

CROWN POINT.—The south winze from the 1,300-foot level, giving a fine circulation of air, and greatly facilitating work. The middle crosscut on the 1,400-foot level is in 38 feet, the lower half of the drift still in ore, the upper portion in quartz and porphyry. A winze is about being started from the 1,400 to connect with the main south drift on the 1,500-foot level, which drift is making slow progress on account of the steady flow of water and the intense heat. The ore breasts throughout the mine are both looking and yielding well. Daily yield, 400 tons of ore.

AMERICAN FLAT.—Driving the main southwest drift on the 400-foot level of the Baltimore shaft is making steady progress, the indications of the development of a body of ore growing steadily more favorable as the work advances. It having been rumored that there has been a good development of ore in this mine, we are authorized to state that the mine will be thrown open for the inspection of all those who desire to visit it during the next three or four days, so they can see it for themselves.

SIERRA NEVADA.—Sinking the new shaft is making steady progress, the rock in the bottom blasting finely. The mill has been shut down since Wednesday last, for the purpose of putting a new cylinder on the driving engine, which repair will be completed and crushing ore resumed in a day or two more.

DARDANELLES.—Good developments in the Overman exercise an important influence over the Dardanelles, adjoining it upon the south, and being a continuation of the same ground in which the Overman strike is made.

PHIL. SHERIDAN.—A new shaft is being commenced near the foot of the steep declivity, east of the ledge, from which at the depth of five hundred feet a drift will run west to the ledge, cutting it at a great depth, and where good pay ore will undoubtedly be found judging from that already developed in the upper workings and operations.

HALE & NORCROSS.—The yield of ore is about 40 tons per day. The opening of the 1,900-ft. level is making good progress.

SILVER HILL.—There is no water to interfere with sinking the shaft to the 360-ft. level, at which depth a station is about being opened. The ore in the cross-cut from the main south drift at the second station still continues to improve in quality. The extraction of ore from the Justice winze, between the first and second levels, has been commenced. The Hope mill has been started upon ore from the mine.

JULIA.—The main southwest drift on the 1,000-ft. level has reached the body of ore tapped several months since, when the men were driven out by the heavy flow of water. This body, although not sufficiently prospected to prove its extent, is opening out finely, and gives average assays of \$45 per ton.

Sinking the winze from the 1,000-ft. level, to connect with the main west drift at the 1,200-ft. station, is making steady headway, the bottom still in rich ore. This main west drift on the 1,200-ft. level, is making slow progress, the rock in the face blasting hard, with occasional seams of white quartz crossing the course of the drift.

ARIZONA, UTAH AND GLOBE.—The main west drift, on the 400-foot level, is in 324 feet. The rock in the face is quite tough and hard to blast.

OCCIDENTAL.—Operations in this mine are confined to sinking a double winze in the ore body, below the main drift. The ore through which this winze is passing is superior in quality to any heretofore taken from the mine.

SENATOR.—The shaft is down 15 feet below the 400-foot level, the ore vein in the bottom having shown much improvement during the week in both size and quality.

CHOLLAR POTOSH.—Daily yield of ore, 90 tons; assay value, \$45 per ton. The ore breasts and stopes are looking well and yielding the usual amount of milling ore.

DANBY.—The shaft down 300 feet in good sinking ground. There is a slight increase of water in the bottom of the shaft.

EUNOPA.—The face of the tunnel is thought to be fully thirty feet yet from the west wall, and there is every reason for believing that good milling ore will be found before the wall is reached.

JUSTICE.—Raising the main incline from the 400-foot level to connect with the main perpendicular shaft at the 300-foot station is making rapid progress.

GOULD & CURRY.—No pay ore has been discovered by any of these drifts as yet. The developments on the 1,700-foot, or lowest, level are looking much more favorable.

JACOB LITTLE.—The fine vein of rich ore developed in this mine shows improvement. The ore extracted is being carefully saved for milling and will pay well.

UTAH.—A great body of water is expected to be encountered when the ore vein is tapped which is now liable to occur at any moment.

DAYTON.—The ore breasts on the first and second levels are both looking well and yielding finely. The Woodworth mill, on the Carson river, is kept steadily running and crushing ore from this mine. Daily yield, 50 tons of ore.

CALEDONIA.—Raising up on the third compartment of the shaft from the 600 to the 500-foot level is making good progress. The main tunnel has been driven ahead at the unprecedented rate of 12½ feet per day during the week.

SUTRO.—A streak of fine looking quartz has been encountered in the south drift. The ore assays on an average \$15 to the ton.

ALPHA.—The main north drift from the 1,500-foot station of the Imperial is still driven ahead, the quartz in the face looking more favorable for the finding of a permanent body of ore.

BULLION.—The main north drift to prospect the Bullion ground is making good headway with excellent indications of soon reaching the main ledge.

SAVAOE.—The main west drift at the 1,900-foot level is in 20 feet, the face in close, hard blasting rock, the progress made being very slow.

IMPERIAL.—The main east drift at the 1,900-foot station is making steady progress toward the ledge.

KOSUTH.—Driving the main west drift to cross cut the ledge is making steady progress, the prospects of a favorable development of fine ore growing more encouraging as the work progresses.

NEVADA.—The ore body in the up raises shows considerable improvement.

STOCCO.—The extraction of ore from the little shaft in the cañon is being vigorously prosecuted, keeping the mill steadily running.

LADY WASHINGTON.—Sinking the shaft is making good progress, the porphyry in the bottom working much softer.

BALTIMORE CONSOLIDATED.—Sinking the main shaft is making good progress.

TYLER.—The water in the shaft is being lowered at the rate of six feet per day.

NEW YORK CONSOLIDATED.—Sinking the shaft is making steady progress, the bottom still in porphyry mixed with clay and quartz.

EMPIRE.—Sinking the north winze on the 1,700-foot level is making rapid progress, with more favorable indications of a development of ore.

BUCKEYE.—Sinking the main incline has been resumed and is making good progress.

Arizona.

Miner, Jan. 9th: The Elliott Brothers have just completed roasting and crushing in their steam-power arrastra, in Prescott, 2½ tons of gold ore from Big Bug district. They saved \$68.50 per ton.

Several parties are working arrastras at and near Weaver, with good success. And since

Afilierilla, or Filere, and Its Kindred Plants.

Erodium Cicutarium, and *Erodium Moschatum*.

BY RALPH RAMBLER—FOR RURAL PRESS.

California is justly noted for the beauty and novelty of its native plants. Its flora is no less remarkable for plants that are useful, rather than ornamental. Of the various members of the latter class, none are more widely distributed, more generally known, and more justly celebrated, than the pasture plant here described and illustrated.

Afilierilla, or *Fil-e-ré*, as we really pronounce it, has been ranked in a previous paper as the "prince among our pasture plants," and we think it richly merits this distinction.

Bunch-grass, salt grass, from which stock running loose, get all the salt they need; tule grass, burr clover, and many other species of clover, both native and introduced; the lupines and various other rich succulent plants, which are lavishly spread in spring over our mountain and hill sides, our valleys and our river bottoms, furnish the richest and most varied food for the hundreds of thousands of sheep, cattle and horses that are annually pastured in our State.

Even when dry and crisp, as most of the plants are from June till December, they are devoured as eagerly and seem as nourishing as the best of hay. Indeed, in many localities, where this native growth is rankest, it is frequently mown and cured for hay. Entirely dried and lacking in substance, as it generally appears, stock feed upon it and are kept in the finest condition during our severest winters.

Among all our flora, no plant is more valued for such purposes throughout the State, and more widely celebrated, than the plant of which our engraver has given us most excellent likenesses from nature.

Botanically, our *afilierilla*, or, as we prefer to give it, *fil-e-ré*, is an *Erodium*, as has been frequently stated in descriptive works on California. This generic name is from the Greek *erodios*, meaning a heron or crane, and is given on account of the close resemblance of its seed-pod and stem to the head, neck and breast of that bird, as can be readily seen by a moment's inspection. Hence, in works on Botany its common name is given as Herons-bill, and even Storks-bill.

Its California name, *afilierilla*, is a Spanish diminutive from *filer*, a pin, and literally means the little pin. It is given because the long, tapering seed-pod is like a pin. For this reason it is frequently called a pin-plant. Its long and musical Spanish name is reduced by usage to the more convenient form *filere*, in that practical, characteristic style, which Californians have for finding the quickest and shortest way for doing everything.

This plant is frequently spoken of as a native of the Pacific Coast. So long has it been known here, so universally is it distributed in our State, and so well does it thrive on its adopted soil, that we do not wonder at this common error.

It is not, however, a native of America. More than forty species of *Erodium* are known and described by botanists, and a majority of them are natives of the shores and islands of the Mediterranean. One species is described as a native of Siberia; another, of the Cape of Good Hope; one variety is from Numidia; and the two which are so common in California, *E. cicutarium* and *E. moschatum*, are given as natives of Great Britain.

So, our familiar and valued friend, the *filere*, is an exotic from the Old World. As a pioneer, it is even more venerable than a "49-er." We do not know that history tells us when it first emigrated to its new home. It probably came with some of the first shipments of wheat, and barley, and other seed that were brought to our shores. But like the millions of Europeans who have sought homes in America, it has found in California a soil and climate so congenial that it has taken entire possession, and it seems so much at home, that we have come to look upon it as among our aboriginals. And does this seem strange, when we remember how similar our climate is to that of portions of Southern Europe, Western Asia, and Northern Africa?

Filere belongs to the geranium family, which, besides the sweet-scented and cultivated plants of that name, comprise also the wood-sorrel, the balsams or touch-me-nots, and the garden nasturtium, or *tropaeolum*, one species of which (*T. majus*), a native of Peru, is very remarkable for the following fact, which, we are told, was "first discovered by the daughter of Linnaeus." At night, its large orange flowers, shaped like those of the larkspur, or snapdragon, "emit spontaneously at certain intervals vivid sparks, like those of an electric machine."

When any of our lady friends are tending their beautiful and valued pets, the rose geranium and its kindred, which beautify their windows, rooms and conservatories, do they ever stop to think or have the time to learn, why this plant is called *geranium*. You know there is a reason for everything. This name and *erodium* are given for very similar reasons, as seems natural when we think of the close relationship of the plants to which they belong. *Geranium* is from the Greek word *geranos*, a Crane, and the name is given, because the seed-pod bears some resemblance to a crane's bill. For this reason, crane-bill is a common name of the geranium among botanists.

In the engraving, Fig. 1 represents an entire plant of *E. cicutarium*, very much reduced from its natural size, in order to give those unfamiliar with it, a correct idea of the general appearance of this noted plant. Fig. 2 represents stem, leaves, flowers, seed-pods and seeds with their spirally twisted filaments, of this species in their natural size. Fig. 3 is a natural sized leaf of *E. moschatum*.

The striking difference between the leaves of the two species, gives to the former the common name of *fine-leaved filere*, and to the latter, *coarse-leaved filere*, by which our people most generally distinguish them.

The excellent object-teaching of the engraver makes any attempt at a minute description of these plants unnecessary. We will, therefore, point out only a few of the different qualities which distinguish the species. A strong odor is a mark of these plants, as it is of other members of the geranium family. Mash the stem and leaves of *fine-leaved filere*, and they emit the odor of parenips very decidedly. *Coarse-leaved filere*, besides having coarser and rather shorter stems, leaves closer together and rather smaller flowers, has also a very strong odor of musk. Hence its specific name, *moschatum*, or *musky*.

The name, *ciutarium*, from *ciuta*, meaning hemlock, is said to be given to the species, because its leaves are finely divided, like the leaves of that notorious plant. But we

as *E. romanum*, so called because it is a native of Italy. Some species may have been introduced into California by the early Jesuit missionaries. Future research will show whether we have other species. The *filere* is one of our earliest plants to flower, and one of the latest to remain green.

Let us try to make clear this bond of union among plants which would otherwise seem far removed from each other. We will not say, at variance with each other, for, in the world of flowers, almost a universal harmony prevails. To have this tie understood, we must again call attention to the stamens of flowers, which, as we have previously explained, are the male members of the vegetable kingdom.

Look at the stamen of any flower, and you will find it consists of three parts, viz: a single thread or stem, called the filament; at the end of this a knob of various shapes, called the anther, and on this anther a fine dust, or pollen, the fructifying power of plant life.

Now in all this class of plants just enumerated, and the members of its families are counted by thousands, the filaments of the stamens are more or less closely united at their bases in one body, and they encircle in various ways the pistils, which, you know, are the female members in the world of flowers.

All these plants, Linnaeus combined in his 16th Class, and called it *Monadelphia*, from two Greek words meaning one brotherhood.

ALFILERILLA, OR FILERE.

must confess, it is not altogether agreeable to associate in any way with so nutritious and attractive a plant as this general favorite, an herb, like hemlock, so repulsive from its poisonous qualities, and with so black a historic record, if for no other reason than its being made an instrument of death for one of the noblest of philosophers, by the sentence of his unjust and misguided accusers.

The flowers of both of these species are of a delicate pink or rose-color. Each has a five-cleft calyx, five petals, five stamens, and produces five-barbed seeds, like the seeds of spear-grass. The appearance of these seeds, when matured, and the manner in which they are attached to the stem supporting them, is well indicated by the engraver.

The tendency to twist, especially when exposed to the heat of the hand or sun, seems to be a means which nature has provided to enable the seed to force its sharp points into loose soil and plant itself.

After a wet winter, *filere* grows very rank on soil of any strength. It sends out branches two and even three feet long, and form a very dense herbage which makes the best of wild hay. Its stems are full of mucilage, and Indians are said to eat them with evident relish.

These two are the only species of *filere* that the writer has been able to detect in San Joaquin valley.

Possibly we also have a variety of *E. cicutarium* called *hippinatum*, because its leaves are very finely divided. Loudon says the latter variety is a native of Numidia. We may also have in some portions of California the species known

as *E. romanum*, so called because it is a native of Italy. Some species may have been introduced into California by the early Jesuit missionaries. Future research will show whether we have other species. The *filere* is one of our earliest plants to flower, and one of the latest to remain green.

Let us try to make clear this bond of union among plants which would otherwise seem far removed from each other. We will not say, at variance with each other, for, in the world of flowers, almost a universal harmony prevails. To have this tie understood, we must again call attention to the stamens of flowers, which, as we have previously explained, are the male members of the vegetable kingdom.

Look at the stamen of any flower, and you will find it consists of three parts, viz: a single thread or stem, called the filament; at the end of this a knob of various shapes, called the anther, and on this anther a fine dust, or pollen, the fructifying power of plant life.

Now in all this class of plants just enumerated, and the members of its families are counted by thousands, the filaments of the stamens are more or less closely united at their bases in one body, and they encircle in various ways the pistils, which, you know, are the female members in the world of flowers.

All these plants, Linnaeus combined in his 16th Class, and called it *Monadelphia*, from two Greek words meaning one brotherhood.

Let us try to make clear this bond of union among plants which would otherwise seem far removed from each other. We will not say, at variance with each other, for, in the world of flowers, almost a universal harmony prevails. To have this tie understood, we must again call attention to the stamens of flowers, which, as we have previously explained, are the male members of the vegetable kingdom.

Look at the stamen of any flower, and you will find it consists of three parts, viz: a single thread or stem, called the filament; at the end of this a knob of various shapes, called the anther, and on this anther a fine dust, or pollen, the fructifying power of plant life.

very economically too, on account of the small amount of material needed to meet the size of their patterns. When food is scarce, they eat the small leaves. With the large ones they cover their houses. With the ash of the leaves they make a very fair soap. Both leaves and bark are used medicinally.

Such is this great Linnaean brotherhood of plants to which our humble and beautiful *filere* belongs. This principle of oneness, discovered by Linnaeus, can then unite by a common tie plants so remote in place and seemingly so unlike in nature, as to include in the same vast family our simple pasture plant and the odd monkey-bread of Africa.

San Joaquin Valley, Jan., 1874.

What Becomes of the Quicksilver?

At the New Almaden quicksilver works, some years ago, it became necessary to pull down a portion of the old retorting furnaces to make room for other machinery. Upon investigation it was discovered that the ground where the furnaces had stood was completely saturated with quicksilver. The company set a body of hands to work upon the spot with hydraulic pipes, and the amount of quicksilver which was sluiced out in a short space of time was prodigious. The deeper the work proceeded the richer was the yield of mercury. Points were reached where the liquid metal could be dipped up with ladles, and it was ascertained that even the bed rock—a soft tertiary sandstone—was completely saturated with the liquid mineral. Much of this porous rock was quarried and retorted, but at length the cost of the work exceeded the profit, and the work was abandoned. The present consumption of quicksilver in reducing the ores of the Comstock is about 800 flasks per month, or about three-fourths of a million of pounds per annum. The entire amount consumed in the State is about 1,100 flasks per month, or nearly 1,000,000 pounds per annum.

In former years, the amount of mercury consumed was not so great, nor the price so high as it is now, but during the past ten years many millions of dollars' worth of this valuable substance have been lost in our silver reduction works. As mercury is indestructible, and can only lose its metallic character by being chemically combined with other substances, the query naturally arises, where does it all go? The bed rocks in this region are not porous like the miocene rocks at New Almaden, but they are all volcanic in character, and therefore hard and compact. There are doubtless many spots in the trachytic greenstone—the principal superficial rock of this locality—which are broken into minute fissures, but the main mass of the rock is solid and impervious even to water, and there must be reservoirs of pure quicksilver somewhere in Gold Cañon and also in Six-mile Cañon. As quicksilver is now worth more than one dollar per pound, the discovery of a big deposit of the precious substance would be better than finding a rich gold lode.—*Virginia Chronicle*.

Denver Branch Mint.

The following is a full statement of the Mint receipts during the year 1873, closing today, as furnished by Rodney Curtie, Esq., Chief Clerk:

Month.	No. Deposits.	Ozs., Gold Bullion.	Value.
January.....	73	2,066 79	\$34,008 09
February.....	69	2,005 45	33,261 15
March.....	74	2,211 07	36,755 89
April.....	69	1,788 10	29,862 77
May.....	119	3,190 88	54,421 94
June.....	115	3,914 73	65,579 88
July.....	164	4,122 42	69,908 66
August.....	190	5,626 56	94,304 24
September.....	166	6,959 88	118,197 19
October.....	178	5,318 37	89,610 25
November.....	131	5,004 33	84,238 11
December (est).....	130	5,000 00	81,000 00

Thus it will be seen that the total gold deposits for the first quarter of the year, were 216, valued at \$104,025.13; for the second quarter, 300, valued at \$149,864.09; for the third quarter, 520, valued at \$282,469.98; and for the fourth quarter, 439, valued at \$257,848.36; making a grand total of gold deposits for the year, of 1,475, valued at \$794,207.56.

Additional to the above were silver deposits in June, value \$1,220.54; one in July, value \$582.09; five in August, value \$3,365.21; thirteen in September, value \$11,041.01; making a total of 16 deposits, valued at \$14,988.31.—*Denver Tribune*.

MILLING STATISTICS.—We glean the following particulars concerning the operations of the Brunswick mill from the annual report of the Superintendent. This mill, owned by Messrs. Jones & Hayward, is one of the finest in the world. It is situated, it will be remembered, on the Carson River, a short distance east of Empire City. It has 56 stamps, and is run by water power, its full working capacity being 160 tons per day. It is supplied with ore entirely from the Crown Point mine. During the year 1873 the quantity of ore crushed at this mill amounted to 34,500 tons. The cost of labor, including construction, was \$59,231. The number of cords of wood used was 971; quicksilver used, 56,732 pounds, at a cost of \$54,216; cost of castings, 44,796; sulphate of copper used, 42,420 pounds; miscellaneous expenses, \$23,000; amount of bullion produced, 64,200 pounds. The capacity of the two other mills in the neighborhood, the Morgan and Mexican, is respectively 80 and 110 tons per day.—*Gold Hill News*.

Useful Information.

Why do Paints Dry?

It was proved long ago, that linseed oil, when exposed to the air, became covered with a hard crust, and that this crust is produced by the absorption of oxygen. Paint made from oil and coloring matter alone does not dry because it parts with any thing or because it gives off any vapor, but because it becomes hard by the action of the atmosphere. It is stated in a recent work on paints that oil does not form even the basis of a paint. This is more technical than judicious. Oil alone, if laid on in thin, successive coats, becomes very hard and forms a durable and impervious varnish, which protects the wood beneath almost as well as paint would do, at least so far as moisture and air are concerned. Against the sun's rays, however, it is a poor defense. But as it has been found impossible to apply a sufficient coat of this varnish in any thing like a reasonable time, the oil has in general been mixed with various colored powders or pigments, which thicken it and thus enable us to lay on a heavier coat. Many of these pigments have no action on the oil, and it is always best that they should have no action. Compounds of lead, which are known to form chemical compounds with the oil, are amongst the very poorest paints. White lead is confessedly one of the least efficient of all our preservative agents, the authority referred to to the contrary notwithstanding.

When paint is applied to a fresh surface of wood, it often appears to dry in a short time. In this case, however, it will be found that the paint has not really dried, but that the oil has been absorbed by the wood; and in this case the pigment is often left in the form of a friable powder, loosely adherent to the surface to which it was applied. It rubs off very easily. This occurs to a less extent with white lead than with any other paint, simply because the lead combines with the oil and holds it on the surface, thus preventing its sinking in. We are inclined to regard this feature as one which confers no advantages upon white lead. It is probably better for the wood that as much oil as possible should soak into it, and it is no great disadvantage that the paint of the first coat should not adhere strongly. Where economy is an object, the absorption of the oil is prevented by first applying a coat of cheap sizing. The size fills up the pores of the wood, and prevents the sinking in of the oil. For in-door work, this answers very well, but for out-door purposes it is objectionable.

But all paints do not dry in the manner that we have mentioned. For in-door work, where it is desirable that the paint should dry rapidly and have a dead or non-reflecting surface, paint is generally mixed with turpentine. This is a volatile oil, which passes off rapidly when exposed to the air, and thus leaves the paint behind as a thin crust. This ability of the paint to resist atmospheric influences is thereby lessened; and this, for in-door work, is a matter of no consequence. It would be wrong, perhaps, to say that the oil of turpentine passes off entirely by evaporation, as a small portion probably becomes oxidized and remains behind. The amount so retained is, however, very small.—*American Homestead.*

A NEW WEATHER VANE.—The old weather-cock has two essential faults; it indicates a direction when there is a dead calm. It gives no means of learning the force of the wind; while it fails to show the true course of the same, by exhibiting merely its horizontal component. M. Tany proposes the arrangement to be attached to the ordinary lightning rod. Just above a suitable shoulder on the latter is placed a copper ring, grooved and made into a pulley easily rotated in a horizontal plane. Around this passes a knotted cord, the ends of which are secured to the extremities of a short stick or metal rod, to which is secured a simple streamer. Thus constructed the vane indicates a calm by falling vertically, and besides shows the strength of the wind by being blown out more or less from the lightning rod. As is evident, it is capable of motion in every direction, so that if there exist in the wind an upward tending vertical component, the same will be shown.

TANNING LAMB-SKINS WITH THE WOOL ON.—Wash the pelts in warm water, and remove all fleshy matter from the inner surface; then clean the wool with yellow soap, and rinse the soap thoroughly out. When this is done apply to the flesh side the following mixture for each pelt: Common salt and alum, one quarter of a pound of each, and half an ounce of borax, dissolved in a quart of warm water; add to this enough rye-meal to make a thick paste, and spread the mixture on the flesh side of the pelt. Fold the skin lengthwise and let it remain two weeks in an airy and shady place, then remove the paste from the surface; wash and dry. When nearly dry scrape the flesh side with a knife, working the pelt until it becomes thoroughly soft.

COVERING FOR STEAM PIPES.—Loose paper is wrapped round the pipes and painted with thin syrup; on this is painted a mixture of 4 bushels of loam, 6 bushels of sand or coke-dust, 3 pails of syrup, and 30 pounds of graphite; the mass is put on 20 mm. thick, and painted with oil or tar.

New Way of Coloring Metals.

It is announced that metals may be colored quickly and cheaply by forming on their surface a coating of a thin film of a sulphide. So for instance brass articles may be thus in five minutes coated with any color varying from gold to copper red, then to carmine, dark red, and from light anilin blue to a blue white, like sulphide of lead, and at last a reddish white, according to the thickness of the coat, which depends on the length of time the metal remains in the solution used. The colors possess the most beautiful luster, and if the articles to be colored have been previously thoroughly cleaned by means of acids and alkalis, they adhere so firmly that they may be operated upon by the polishing steel. To prepare the solution dissolve 1½ ounces of hyposulphite of soda in 1 pound of water, and add 1½ ounces of acetate of lead dissolved in ½ pound of water. When this clear solution is heated to 190° to 210° Fahr., it decomposes slowly and precipitates sulphite of lead in brown flocks. If metal is now present, a part of the sulphite of lead is deposited thereon, and, according to the thickness of the deposited sulphite of lead, the above-mentioned beautiful luster colors are produced. To produce an even coloring, the articles must be evenly heated. Iron treated with this solution takes a steel-blue color; zinc, a brown color; in the case of copper objects, the first gold color does not appear; lead and zinc are entirely indifferent. If instead of the acetate of lead an equal weight of sulphuric acid is added to the hyposulphite of soda, and the process carried on as before, the brass is covered with a very beautiful red, which is followed by a green, (which is not in the first-mentioned scale of colors,) and changes finally to a splendid brown with green and red iridescence. This last is a very durable coating, and may find special attention in manufactures. Very beautiful marbled designs can be produced by using a lead solution thickened with gum tragacanth, on brass which has been heated to 210° Fahr., and is afterward treated by the usual solution of sulphide of lead. The solution may be used several times.

PEPSIN AND THE DIGESTION OF FIBRIN WITH-OUT PEPsin.—Experiments performed in the physiological laboratory of Heidelberg by Gustave Wolffügel, under Kühne's direction, have led to the results essentially differing from those of Von Wittich and previous experimenters. 1. Wolffügel finds that pepsin is not diffusible. 2. That the pyloric glands produce no pepsin. 3. That both hydrochloric and citric acids in solution, containing 0.4 per cent. at a temperature of 60° C., are capable of dissolving boiled fibrin, though somewhat slowly, and of converting it into peptone. 4. This power of forming peptone is perceptible in both acids at a temperature of 40° C. (104° F.) Though the action of nitric acid is decidedly slower, on this account nitric acid is to be preferred to hydrochloric in experiments on the presence and action of pepsin.

BRACONOT described a sugar obtained from mushrooms which was found to be mannite. A. Muntz examined several different species, and in some no mannite was found, but a sugar which was undoubtedly trehalose or mycose; some contained both sugars.

GOOD HEALTH.

Catching Cold.

Catching cold is "as easy as lying," but to explain the pathology thereof is by no means so readily done. In fact, until the recent researches of Dr. Rosenthal, whose work on the subject is attracting much notice in Europe, almost nothing was known about it except the mere fact that the ailments popularly ascribed to "cold" are liable to occur after the body, or some part of it, has been suddenly chilled, that is, cooled below the normal temperature. There are two factors concerned in this chilling process; the nature of the external medium—such as air or water—in contact with the body; and the condition of the blood-vessels.

Dry air has very little power to abstract heat, if it be still; but a slight wind, from the constant contact of fresh particles of cold air on the surface of the body, soon carries off its heat. If there is much moisture combined, the chilling effect reaches its maximum. Experience has shown that it is not so much the absolute lowness of temperature which gives rise to colds, as sudden changes from a higher to a lower. The reason of this was not understood until Dr. Rosenthal explained it. When the surface of a healthy animal is exposed to cold the cutaneous vessels contract, and by thus confining the blood to the interior of the body, prevent its cooling, and preserve the temperature of the vital organs, unless the application of cold be continued for a considerable time. This is not the case, however, when the animal has been previously exposed to warmth. The cutaneous vessels become paralyzed by the heat, and remain dilated even after the cold has been applied. The blood is thus exposed over a large surface and becomes rapidly cooled, even though the temperature of the surrounding medium is not very low.

In Rosenthal's experiments, animals were kept from 97 to 104 degrees F. The temperature of the animals themselves quickly rose during their confinement to 111 or 113 degrees. After their removal it not only sank to the normal temperature, but even below it, so that an animal which was from 108 to 111 degrees in the warming apparatus fell to 96.8 degrees, and remained at that for several days, although the room in which it was kept was moderately warm. Confinement in a close office, hot theater, or crowded ball-room, will have a similar effect on man. From such places, people pass out into the cool, open air, or sometimes even purposely station themselves in a draught. The blood, which is coursing through the dilated vessels of every part of the surface, is rapidly cooled, and, on its return to the internal organs, cools them much more quickly than it could have done had the person simply been exposed to cold without dilatation of the vessels by previous warmth. Rosenthal lays much stress on the great effect of sudden cooling in bringing on a cold, the sudden change in the temperature of the blood producing an irritating effect, and inducing inflammation in any weak organ in a way that a gradual alteration would not do. It would seem, however, that the alteration must be from a temperature above to one below the normal temperature of the blood, and not a mere reduction from one considerably above the normal to one at or near it.

When much heated we may stand for a short time in a cool atmosphere with impunity; but if we stand long enough to produce a shiver, we run a great risk of catching cold. The fact that it is more dangerous to sit for a long time in wet clothes, appears to indicate that a considerable and more gradual cooling, such as may then occur will produce similar effects to a slight cooling suddenly effected by exposure to a cold draught after being in a chill, in causing inflammations may be partly due to the effect of cold on the tissues themselves, and partly to the congestion which will occur in some parts when the blood is driven out of others by the contraction of their vessels. Rosenthal is inclined to ascribe the chief power to the former cause. Everybody knows the beneficial effect of cold baths, cold sponging, etc., in "hardening" persons, as it is termed, so that they are able to face almost any weather and to endure sudden changes of temperature without injury. Rosenthal considers that the frequent application of cold water or cool air increases the tone of the cutaneous vessels, so that they do not become so much relaxed by heat as to be unable to contract with sufficient force when necessary. The power of regulating the temperature is thus preserved, and the person prevented from catching cold.—*Journal of Chemistry.*

THE THERAPEUTIC USE OF DRY POWDERED BLOOD.—Dr. De Pascale, of Nice, several years ago published some observations on the very beneficial effect of warm blood taken the moment when extracted from the calf or ox, killed for general domestic use. He described at that time several cases of hemoptysis, in which a complete cure had been effected by this treatment. In a paper recently published, he states that, finding among his English and American patients at Nice an unconquerable repugnance to such a remedy, he was led to adopt the plan of giving the blood in the form of dry powder. This is merely the revival of a practice which was in vogue many years ago, and which has occasionally been tried in this country. The blood of the ox, after being dried in a water-bath, is reduced to a very fine powder, and grated through a sieve. Dry blood can be taken for any length of time, being almost tasteless, and no repugnance is likely to be felt, as is often the case with raw meat. It can be taken as any common powder, mixed with soups, milk, marmalade, or chocolate, or enclosed in a wafer. In some cases, where even the name of blood might have offended the patient, Dr. De Pascale has given it, mixed with a small quantity of pepsin, under the name of "nutritive powders." The quantity he prescribes has varied according to the age, sex, or the state of health and digestive power of the patient. In general, he begins with thirty grains, which is increased according to circumstances; but the quantity must be left to the discretion of the physician.

HINT FOR PROJECTORS OF TOWNS AND STREETS.—It is worthy of remark that the arranging of the streets according to the cardinal points involves a sanitary objection of no mean import. No fact is better established than the necessity of sunlight to health, and no constitution can long endure, without ill effects, the total privation of its health-giving power. Every house on the South side of a street running East and West must have its front rooms, which are generally its living rooms, entirely deprived of the sun during the summer. This fact, coupled with that of the indoor life of American, and particularly Western women, is enough to account for a very large share of the nervous debility which so generally prevails. If the rectangular system must be adhered to in city arrangement, it would be far better that the lines of streets should be Northwest and Southeast, and the cross streets at right angles with them, than as now disposed; in this case the rooms in front or the rear of a house enjoy at least sunshine in the morning or evening. A strong proof that sunshine is wholesome is found in the fact that during epidemics people occupying rooms not exposed to sunlight are comparatively much worse off than those who enjoy that blessing.—*Manufacturer and Builder.*

DOMESTIC ECONOMY.

Food.

Though man does not live by bread alone, the bread portion of his sustenance is of very great importance. Ignoring the body is as fruitful in mischievous results as living for it alone. Body and soul are so dependent on each other that what affects one affects the other, and the more finely organized the body and the soul of any person may be, the greater must be his care to keep the two in perfect harmony.

It makes a world of difference what one eats. No class of people are so particular about their food, the quality, the mode of cooking, and the manner of serving, as those who live by their brains. They know that the human animal who would keep in the highest working order must be as carefully groomed, as nicely fed, as perfectly appointed as Goldsmith's Maid or Dexter, and they lay their plans accordingly. The cooking a potato, the compounding a cup of coffee, the broiling a steak, the making and baking a loaf of bread, are to them of vital importance, as indeed, they should be to everybody. A great many people never stop to enquire what particular diet is best for them, but following the injunctions of St. Paul, in a sense never intended by him, eat what is set before them, asking no questions for conscience sake or any other sake. If "hog and hominy" is the standard dish, they live on that; if hot soda biscuit and steak fried in lard are provided, that must reinforce their strength and content their appetites. It is a melancholy fact that horses and cows and dogs are more intelligent feeders than most human beings, and by natural consequence, they rarely have dyspepsia, gout or humors. If men and women would be governed in their diet by reason as rigidly as brutes are by instinct, a large portion of the ills that flesh is heir to would never be heard of.

How many who read this column understand the chemistry of food, and know just what they must eat to make them warm, what food builds up bone and sinew, and muscle, and what will best supply the nervous waste? How many understand the effect of diet on the temper and disposition of the mind, and avoid whatever will make them irritable, stupid and melancholy? How many mothers regulate the food of their children with reference to these results, and by so doing secure the tranquillity of their entire households? How many students are there, who, alive to the importance of proper diet, eat only food "convenient for them?"

The object of this article is not so much to impart knowledge as to awaken in other minds a desire to investigate this subject in its various bearings. There are books full of information of all sorts respecting the chemistry of food, the composition of bone, and muscle, and brain, and blood, which, if generally understood, and their suggestions carried out, would go far to banish sickness, and crime, and want.—*N. Y. Tribune.*

WATER IN THE HOUSE.—A prominent writer says: "Let nobody be deterred from bringing water in the house by any fears of failure and perplexity. You might just as well stop the circulation of blood in the body because it is subject to derangement, as to refuse the circulation of water in the house because now and then a pipe overflows, and your frescoes are ruined. Good workmen will prevent any such accident, but if they cannot, give up your frescoes; do not give up your life blood. When I see the farmhouses, the dairies, the kitchens, whose only source of supply is the well in the yard, or the hoghead at the back door, how life would be lengthened and sweetened if all this heavy, and hard and slow water-bringing could be supplanted by a turn of a screw, I wonder that we do not manage to introduce it, somehow, into our marriage contracts. What an increase of vital force would ensue; what a diminished demand for divorce; what a strengthening and upbuilding of the family bond, if a girl should refuse to marry until there was an inexhaustible supply of water, at least in the kitchen. A house without water works ought to be considered as incomplete as a house without doors, and as incomplete in the country as in the city."

How to Cook FRESH FISH.—After fresh fish have been dressed well and washed, roll them in Indian meal, (after being sifted of course,) put them into a hot spider where there has been a large spoonful or two of lard melted. Sprinkle over some salt, then put the spider into the well heated oven and let them crisp over. Take them from the oven, lay them on a deep plate, turn all the fat out of the spider; (it will only be found fit for soap grease). Now put one quarter of a pound of butter in the spider, put it over the fire, and when it is all melted, add one half tea cup of strong vinegar to the melted butter, stir quickly, and pour it over the fish and serve immediately. I find but very few people but what think this method of cooking fresh fish, is very superior to the more common way of cooking it without adding the vinegar gravy.—*Ohio Farmer.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Beach Mining, 49. Alameda, or Filers, and its Kindred Plants, 54. The Cochran Self Feeders; Proposed Mining Legislation; Rolling Mill Machinery for Japan; Catalogue of Arctic Shells, 56. Legislative; Universal Boring Machine; Sequoia Gigantea, 57. Interesting American Minerals at Vienna; Academy of Sciences; Patents and Inventions, 60.
ILLUSTRATIONS.—Beach Mining, 49. Alameda, or Filers, 54. Universal Boring Machine, 57.
MECHANICAL PROGRESS.—Steam Carriages for Common Roads; Cast Steel Railway Axles; Bracket Chairs; Nothing New Under the Sun, 51.
SCIENTIFIC PROGRESS.—Analysis of Galena; New Mode of Liquefying Gases; Solar Light and Heat; New Photometer, 51.
MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 52.
MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado and Idaho, 52-53-60.
USEFUL INFORMATION.—Why do Palms Dry? A New Weather Vane; Tanning Lamb-Skins with the Wool On; Covering for Steam Pipes; New Way of Coloring Metals; Pepsin and the Digestion of Filth without Pepsin, 55.
GOOD HEALTH.—Catching Cold; The Therapeutic Use of Dry Powdered Blood; Hint for Projectors of Towns and Streets, 55.
DOMESTIC ECONOMY.—Food; Water in the House; How to Cook Fresh Fish, 55.
MISCELLANEOUS.—California Quicksilver; Rich Quartz; Railroad Engineering in the Andes; From Troy: Dry Crushing and Dry Concentration of Ores; French Guiana Mines, 50. What Becomes of the Quicksilver? Denver Branch Mint; Milling Statistics, 54. Coal in California; Robinson District; The California Mine; South African Gold Mines; Tin in Java; New Mines in Arizona; New System of Scientific Classification; Miners' Pay, 58. A Remarkably Rich Deposit; Buying Ore at the Smelter; Breath of the Nevada Upas; Miners' Wages; Cherry Creek; An Efficient Arrangement; Mining Experiments, 59.

The Cochran Self Feeders.

The Cochran ore feeders are now in successful operation at the St. Patrick mill, Placer county, the Patterson mill, Tuletown, Tuolumne county, the Independent mill, Sierra county and at Garland's mill in Calaveras county. They were placed in the St. Patrick mill at Newesetle, Placer county, Cal., on trial. The Superintendent of the mill, J. H. Croes, man, states that they have been in use there about two months, giving perfect satisfaction and doing all they were represented to do. In a letter to the Secretary of the company he advises keeping them for the following reasons:

"1st. They save us in labor alone, \$6 per day aside from the annoyance and expense of getting good men to feed the battery.

"2nd. The gain over batteries fed by men is two tons per 24 hours. We formerly crushed 18 tons and now crush 20 tons per day.

"3d. They keep the pulp more regular in the batteries, and the screens and plates always free, thereby ensuring good battery smalgamation.

"4th. Being automatic they can be so nicely adjusted that the shoe rarely, if ever, strikes the die. The saving by this of wear and tear of shoes and dies alone will repay the cost of the machines in less than 12 months. No quartz mill should be without them."

WORK AT THE FOUNDRIES.—Work at the foundries and machine shops is generally slack just at present, though the promise for an increase of business is better than it has been for some time. Many of the shops are quite slack and employing very few men as compared with the busy season. As spring opens and orders from the interior arrive, the shops will all be in full blast again and employ the usual number of hands.

The Risnon Iron Works are running busy, but have not much large work on hand. They are doing considerable small jobbing. They are also casting a good many car wheels just at present, and some large spur wheels, etc., to go to the Comstock mines. They have a good force of hands at work.

Proposed Mining Legislation.

In our last issue, we gave in full the proposed mining law, which has been introduced in the House of Representatives, by J. D. Ward of Chicago. Speaking mildly, it is to be hoped that our representatives in Congress will do their utmost to choke this bill off. If it becomes a law it will be the worst blow to the mining interests of the Pacific Slope that they have ever received. Under its provisions every claim holder in the country would be obliged to apply for a patent within a year, and pay for it at double the rates now necessary for lode claims, and five times that for placer claims. This bill differs from the present law in these important particulars: It compels all claim holders to apply for a patent, and pay for their claims at the rate of ten dollars per acre within one year; while under the law as it now stands, the owners of mining locations are not required to apply for a patent unless they desire to do so, and when application is made, the price per acre for placer claims is \$2.50, and for lode claims \$5.00.

The idea of this bill being "an amendment to an Act entitled an Act to promote the development of the mining resources of the United States," is a pleasant little joke on the part of the Hon. J. D. Ward of Chicago, who fathered the bill. "Promote the development" is good—as a joke. Why, it will be the very worst possible thing for our miners that can be done. At present not one claim in a thousand is ever patented, because in the first place there is not much need for it, and in the second place it is too expensive an operation for eight miners out of ten.

We don't believe Mr. Ward knows anything about mining or mining matters. The act will be a good one for lawyers and a very poor one for the miners. The principal object of the bill is to raise money from the sale of the mines to assist in paying off the national debt, and lessen the burden of taxation. Every few years this old game of selling the mines to pay the national debt comes up. The *Chronicle* estimates that there are 15,100,000 acres of mineral lands, which at \$10 per acre would yield a most magnificent sum to the Treasury. Why people buying mineral land should pay \$10 per acre and people buying agricultural land should only pay \$1.25 per acre, we do not see. A farmer can get his crops in the first year; a miner often works many years with no returns. In fact it takes him a year or so to prove whether the mine is worth even the labor expended on it. Must one man be compelled to buy a "pig in a hsg," and pay about 8 times as much as the man who sees what kind of a pig he is buying?

We venture to say that if the bill passes, the individual miners will, many of them, abandon the business; prospecting will not be popular, and incorporated companies will "rule the roost." About that time people will begin to think that our law-makers "developed the mining interests of the United States" on a mistaken principle. Small mines would have no show. It would bankrupt our mining interests to pay the millions of dollars necessary to be paid in the first year of the operation of the proposed new law. But what a harvest for the lawyers there would be! Perhaps Mr. Ward is one, and wants to settle on the Pacific Slope. What a quantity of litigation there would be while all the big mines were getting their patents the first year, and how many millions the lawyers, clerks, surveyors, etc. would receive as fees!

It is impossible to sum up all the demerits of this law in one newspaper article, and we shall have more to say concerning it in a future issue. Meanwhile we invite correspondence on the subject, and hope our Pacific Coast Representatives, who ought to know something of the mining interest, will do their level best to fight the bill to its death.

THE PACIFIC IRON WORKS, which have just received the order for rolling mill machinery for Japan, mentioned in another column, have just finished a lot of pans and settlers for Walbridge's new smelting works at Brooklyn. They are also making repairs in the Pacific Mail Steamship Co.'s steamers *China* and *Colima* putting the machinery in order, etc. The Pratt steam pumps, illustrated in this journal, are being made in numbers at these works. They are sending them out all over the country, for mining and agricultural purposes, and are said to be giving great satisfaction. These pumps are adapted to all classes of work to which a power pump is applied.

THE PATENT RIGHT CONVENTION met at Washington on the 16th inst., and 200 delegates were present, representing 18 States.

Rolling Mill Machinery for Japan.

For the past few years the foundrymen of this city have received occasional orders for machinery of different kinds to go to Japan. An item of considerable interest in this line is an order for rolling mill machinery, recently received here from the Japanese Government by the Pacific Iron Works. The order comes directly from the Japanese Government through their Engineer. The machinery wanted comprises a complete set of smelting and forging machinery. It consists principally of engine and boiler, blowing cylinder, steam hammer, bloom-squeezer, shears, ore crusher, furnaces, etc. The engine is to be of 40-horse power. The Government Engineer, who orders the machinery, states that they have in Japan large bodies of magnetic ore. It yields from 60 to 65 per cent. of iron, "one-third of which runs as malleable cast and two-thirds as a good quality of chilling iron," which would be something equivalent to the Saulshury iron of the East, a celebrated brand, which is used principally for the manufacture of our wheels. The malleable cast turns into a very good steel.

The machinery goes from here to Yokohama, whence it will be shipped to the district where the mines are located. The ore deposits are spoken of as very extensive and rich, and may yet become a prolific source of supply. This is their first attempt to develop any of the rich iron ore beds that has been made, and they seem to be in earnest to go to work properly. The metallic wealth of the country is said to be very great, comprising copper in quantities sufficiently large for an extensive exportation, considerable quantities of sulphur, lead, tin and iron, with some gold and silver. The Pacific Iron Works shipped some two years ago a complete 10-stamp quartz mill to Japan, and another quartz mill has also been sent thereby another of the San Francisco foundries. The Japanese artificers in copper, iron and steel have a very high reputation, and as a nation they possess mechanical skill in a high degree, so they will probably soon work their own mines and machinery in a skillful manner.

The Japanese are becoming quite enterprising in the matter of developing the resources of their country, and so far it has been to the benefit of San Francisco, as considerable machinery of different kinds has been made here on orders from Japan. As the people there become more accustomed to the use of machinery in the different branches of arts and manufactures, it is expected that quite a trade in that line will spring up between San Francisco and Yokohama. Our local foundrymen turn out excellent work of all kinds, and have already established a favorable reputation in Japan, as well as on the Pacific Coast.

WHITE PINE.—The *News* commends the English corporation known as the Eberhardt and Aurora Company, as being the only one that has done any systematic mining in White Pine. It says that the other companies have been scraping up the ground, and scratching here and there for rich ore, while the English incorporation has been working intelligently and with a purpose.

THE SAN FRANCISCO BOILER WORKS last year, made a mile of 30 inch pipe for the Spring Valley Canal Mining Company, at Cherokee Flat, Butte county. The pipe paid for itself in one month's run. This claim is the one which has made such a reputation for itself, by turning out large gold bars, one of them being the largest ever made on the coast.

THE ETNA FOUNDRY is quite busy on local work. They do a great deal of repair work, and are now making repairs for the woolen mills, and fixing up the candle factory. They are fitting up a steam fire engine for the Kimball carriage works, and making a pair of engines, etc., for the steam Yacht "Peerless," which are nearly completed.

ON THE RIO BLUE lead at Kernville, Havilah mines, Cal., they are now erecting an 80-stamp mill, in addition to the one now running night and day. The mill is run by the water power of Kern river, which is only half a mile from the mine. So says the Havilah Miner.

OUR CITY SUPERVISORS are on the right track when they propose to condemn the present water works for the city, and also propose that the city manufacture its own gas. A committee will be appointed to inquire into the water subject, and report the result to the Board.

Catalogue of Arctic Shells.

Mr. W. H. Dall, of the United States Coast Survey, has prepared for the California Academy of Sciences a catalogue of shells from Behring Strait and the adjacent portions of the Arctic Ocean, together with descriptions of two new species. Having had occasion to examine several collections of shells brought down by whalers from the Arctic Ocean in the autumn of 1873, Mr. Dall was struck with the fact that there does not appear to be any catalogue of the species of that vicinity. Indeed, the region has been visited by but few collectors, and the species have been commonly described among a host of others from all sorts of localities. The collectors, upon whose localities dependence can be placed, are rare, and are mostly of modern date. Mr. Dall has therefore prepared the catalogue referred to as a kind of a preliminary basis for a better one.

The authorities are chiefly as follows: Gray and Sowerby in the Voyage of the *Blossom*, Capt. F. Beechey; Gould, on the shells collected by the late Dr. Wm. Stimson, of the North Pacific Exploring Expedition under Capt. (now Admiral) John Rogers; Dr. P. P. Carpenter's Report to the British Association Mr. Dall's own collections from Plover Bay and Norton Sound and southerly, from 1865 to 1873; collections from Cape Espenberg and Grankey Harbor by Capt. E. E. Smith, and from Icy Cape by Capt. T. W. Williams in 1873. A few other species known to be found in that region have been added from various sources. Synonymy in general has been waived, except for the purpose of referring to a figure.

The region covered by this catalogue is probably a rich one, especially in forms of the *Buccinoid* and *Chrysomoid* types, and it is to be hoped that it may be more thoroughly explored before long. The large collections of species made by Dr. Stimpson in this region were lost in the Chicago fire, and contained many unpublished forms. It is therefore particularly desired that more material should be obtained, and none are better able to contribute to our knowledge in this respect than our hardy whalers. The catalogue will be published in the next volume of the proceedings of the California Academy of Sciences.

DEATH OF THE SIAMESE TWINS.—The renowned Siamese Twins died on the 19th inst. Their death has been expected for some time, as they were well advanced in years. On account of their peculiar nature many conjectures have been made as to the manner in which they would die, and it seems that one of them died some two hours before the other: A special from Richmond gives the following particulars of the death of the Siamese Twins, on Saturday morning, at their residence at Mount Airey, Surrey county, N.C. Chang was partially paralyzed last Fall, since which time he has been fretful, very much debilitated, and strongly addicted to drinking liquor, as a means of alleviating his sufferings. He had been quite feeble for several days, so much so as to confine the brothers to bed. On Friday night Chang became worse, and expired suddenly, about four o'clock on Saturday morning. Eng became so terribly shocked that he roared wildly for awhile. This attack was followed by what seemed to be a deadly stupor, and in two hours from the death of Chang, Eng breathed his last. The wives and families of the twins are in the deepest grief—the children, many of whom are deaf-mutes, expressing their sorrow in the most pitiful manner.

TUNNELS WANTED.—In emulation of the Comstock, two or three other localities are after Sntro tunnels. White Pine wants one to run under White Pine Mountain, and develop the wealth known to exist there. At Havilah, Kern county, they want a tunnel which will tap their immense mother lode, a continuation of the famous Big Blue, 1,200 feet beneath the croppings.

NEW MAP.—Charles W. Hendell of St Louis, Sierra county, has almost completed a topographical map of Sierra county. It will be a fine affair, similar to the one of the Slate Creek section, exhibited here last year by Mr. Hendell.

A DONEY ENGINE has been lowered to the 1,500-foot level of the Ophir mine, to be used in working from the east incline, below the 1,700-foot level, where sinking is now going on.

THE KEARSARGE MINE, in Lake county, is said to be producing one pound and upwards of native quicksilver, to the pan of dirt, which equals about \$1 to the pan.

Legislative.

The Legislature has now got pretty well into the business of the session. There are at this time, some 150 bills before the various Senate committees, which will be reported for action as fast as they can be considered in Committee. There is an evident disposition among the members to pay a reasonable degree of deference to the universal demand for retrenchment, the avoidance of special legislation, and a careful scrutiny into the manner in which public money is being expended, etc. With the present temper of the people and disposition of the Legislature there is a conspicuous absence of the thieving and jobbing bills, which have in times past so disgraced the annals of California legislation.

Repeal of the Five Per Cent. Law.

One of the most important measures finally disposed of is the repeal of the odious Five-Per-Cent. Law, which received the sanction of the Governor on the 14th instant.

Fares and Freights.

The most important measure now before the Legislature is Mr. Freeman's Bill regulating Fares and Freights. There is an almost universal demand for legislation of some kind upon this matter; but it is a most intricate and difficult subject to approach and should be carefully handled; there is no doubt but that the bill will pass in some shape, for the people must be protected to some extent from the excessive and discriminating charges of the C.P.R.R. Co. Whatever may now be done, however, it will be but the starting point of reform in this direction, and will only serve as something which may be studied and experimented upon until the next Legislature meets, when we shall be able to legislate more understandingly than we can possibly do now. This question is now before the Legislatures of quite a number of States—probably every one which is in session—and it is also prominently before Congress, in the form of a Bill "To Regulate Commerce by Railroads between the several States."

The discussion of the question of the right of the Government to regulate fares and freights, is definitely settled by the people, by legislatures and by the judiciary—the only question now remaining is 'how to do it.'

Irrigation.

The question next in importance to California, is that of irrigation. Many plans have been proposed to secure some general and uniform system of irrigation for the State. It is now quite generally conceded that it will not do to allow the waters which may be so used to pass into private hands; hence some plan must be adopted which will keep their control either within the several counties or in the State itself.

A bill was introduced, last week, by Senator Bush, of Los Angeles, which seems to meet with much favor, and bids fair to become the outline of a general system for the State. It places the waters within each county under the control of the county itself. Although it is designed especially for Los Angeles, whose waters and their use are almost exclusively confined to that county alone, we see no reason why its general principles may not be extended to other counties, where it may be desirable to extend the same ditch or irrigating, and, perhaps, transportation canal from one county to another. Mr. Bush's bill provides for a County Superintendent of irrigation, who, with a Board of Water Commissioners, shall establish a uniform system for the county, and have charge of the same. This plan is very much like that which has been so successfully adopted in Utah. We shall have more to say upon this matter at another time.

The Apportionment Question

Is one in which the agricultural counties, and San Francisco especially, is interested, in order that the central and coast regions of the State may have their due share of representation at the State Capital—a right of which they are now unjustly deprived. The matter is before the Legislature; but we fear there will not be that spirit of fairness and equality manifested in its settlement which should obtain. We trust, however, wise counsels will prevail and even-handed justice be meted out.

Equal Taxation.

Mr. Evans has a bill before the Legislature, which proposes a remedy for the double taxation that has heretofore borne so hard upon small property men who are compelled to raise money upon real estate by mortgage. This bill provides for the assessment of mortgaged property to its full value, less the amount of mortgage or lien which there may be upon it—the mortgages to be assessed to the parties which own them. This, or some similar bill, ought certainly to become a law.

The No-Fence Law.

Originally intended only for Fresno county, but now applying to Kern, Tulare, Ventura and Santa Barbara, which passed the Assembly on the 12th instant is now, by reference of the

Senate, in the hands of the Judiciary Committee for further consideration. In the meantime numerous signed petitions are coming in in favor of its final passage. It should and doubtless will become a law soon—if not even before we go to press with the present issue. The farmers of Kern and Tulare are especially anxious about it, as upon its passage depends the sowing of a large breadth of grain the present season; much further delay will make it too late for sowing.

After Sargent's Land Bill.

The bill introduced by Mr. Sargent to forbid the listing or transfer of any mired swamp land from the Federal Government to the State, is meeting with most marked disapproval by his constituency here. There is quite a general belief that there is a very large cat carefully concealed in this metaphorical meal tub, and a concurrent resolution has been introduced, instructing our Senators and Representatives in Congress to oppose the passage of the bill in that body. The bill has been reviewed in an able and exhaustive speech by Mr. Speaker Estee and its doubtful character is quite fully established by the great interest which the railroad men, in and out of the Legislature, manifest in the defeat of the condemnatory resolutions. The resolutions passed to engrossment on Tuesday.

Unwarrantable Expenditures of Public Money.

The Legislature is looking closely after the expenditures in the construction of public buildings, etc. The manner in which the public money was squandered in the construction of the Normal School, has already shown how

they can have no control over them for their after service by way of remuneration. The consequence is that our young men are too generally growing up in idleness and vice. A good apprentice law would no doubt do much towards settling the question of what to do with our boys.

New Counties.

It is proposed to establish two new counties—one by setting off a portion of Tulare and Kern into a new county, with a county seat at Porterville. We are not aware that any bill to this effect has yet been presented to the Legislature.

But Mr. Tully, of Monterey, has favorably reported from a committee a bill creating the county of San Benito out of that portion of Monterey county lying east of the mountains. About seven-eighths of the inhabitants living in the proposed county have petitioned for such action. The new county would contain about 5,000 inhabitants, and \$4,500,000 of taxable property; leaving Monterey still with \$8,000,000. The bill will probably become a law.

Constitutional Convention.

The papers are generally, with the exception of the *Sacramento Union*, averse to the scheme for a Constitutional Convention, as a needless expenditure of the public money. There is no reason why the next Legislature may not attend to such duty, as if the matter is referred to the body its members (with the exception of the hold-over Senators) may be elected with special reference to such a work. It would no doubt greatly benefit Sacramento to have a

UNIVERSAL BORING MACHINE.

easy it is to swindle the people when such work is not closely looked after. Suspensions having become current that there was something wrong about the erection of one of the buildings of the State University at Oakland, a committee of investigation has been appointed who are now engaged in that labor. The testimony just concluded, shows that even if no frauds were intended there has been a looseness manifested on the part of those who had charge of that work which is highly culpable. There is much reason to believe that much money has been carelessly expended there, which a little care might have saved; and that the State has suffered to the amount of some \$40,000, and finds herself with an inferiorly constructed building on her hands. Dr. Merritt of Oakland, who has had the matter under his special charge, owes it to himself as well as to the State to see that the investigation is complete and thorough.

Rumor also has it that there is something wrong about the Insane Asylum now in progress of construction at Napa. The law authorizing the work assumed that \$300,000 only would be required for its completion. It is now claimed by some that \$1,500,000 will be called for. It is the story of the San Francisco City Hall repeated on a smaller scale.

It is proposed by Senator Oulton to introduce a bill imposing upon commissioners a penalty for exceeding the law in the matter of such expenditures. Should not the architects, who are the first to mislead in such matters, by handing in to commissioners erroneous estimates, come in for a little legislation?

An Apprentice Law.

Senator Perkins has given notice of the introduction of an Apprentice Law. Such a law is no doubt one of the needs of the State—if it can so be drawn with equal and exact justice to both the apprentice and master. As it is, there is a disinclination among employers to receive boys with a view of really teaching them anything in the way of a trade, for the reason that

Universal Boring Machine.

Among the tools used in wood working establishments, few have been more neglected than the wood-boring machine. As a general rule, shops otherwise well supplied with labor-saving devices lack this important and useful tool, or, when its want becomes felt, seek to supply its place with an apparatus which, perhaps, partly answers for the special object sought, but which lacks the ingenious contrivance to make it advantageously used or even applicable to a great variety of work.

The annexed engraving represents the Universal Boring Machine, which the manufacturers have made a special study so as to effect the necessary improvements in order to enable it to meet the wants detailed in many inquiries received relative to its adaptability for different uses. The machine is strongly built of iron and steel, and combines, in the small space it occupies, nearly all the facilities needed for boring large and small holes in any desired angle. It is cost with a heavy solid frame and body, and has two cone pulleys with three faces, for giving the mandrel the proper speeds for different sized bits. The mandrel, which is of steel, is made to traverse by a foot lever. The operator can adjust the leverage in a moment, so as to stop at any desired depth up to 11 inches. The adjustable table has a surface of 21 inches in width with 15 inches slide, and it can be raised or lowered 16 inches, enabling one to bore in the center of 32 inches. Adjustable rests upon the table render the work readily placed at any desired angle in the horizontal plane, while the table top itself can be set on an incline towards the bit to any angle not exceeding 45°, and the same can be raised or lowered, and slid forward or back, preserving the inclination given.

Angers and machine and pod bits of the various sizes can be employed, as an adjustable chuck is fitted to the mandrel for holding the same. The levers are in the inside of the machine, where they are protected, and where no dust and shavings can obstruct their movements. There is no spring connected with these parts to impart return motion, which requires a greater amount of pressure at this point of the operation than is needed to secure a smoothly finished hole.

It will be seen from the foregoing that the machine is always ready for doing either light or heavy boring at any angle desired, with ease and with great rapidity.

On machines or devices where the stuff has to be moved up to the auger, there is a liability of twisting, of making a crooked hole, and of breaking the bit, especially if knotty or crossgrained material be used; and the expense of bits would in a short time amount to the cost of the present invention.

The countershaft attached to the machine rests in adjustable boxes, and has a tight and loose pulley of eight inches diameter and three and a half inches face, and should make 900 revolutions per minute. For further particulars, address Bentel, Margedant & Co., Hamilton, Ohio, the well known manufacturers of the "Universal Wood Workers," planers and other wood working machinery.

Sequoia Gigantea.

It is a noticeable feature in the growth of the young trees of the Sequoia gigantea, that the body of the trunk at the ground attains to a large proportionate size as compared with most other trees of the same age, and from the ground tapers rapidly upward. In advancing a reason for this, we will have to assume that nature, even in the form of a tree, thinks; or in other words, knows just what it is about. The Sequoia in its native soil, climate and altitude above the sea, grows to a very great height and to an immense size.

These conditions must be met in a growth of trunk and root that will stand the immense strain from the great leverage of its vast trunk and wide spread foliage in hoary gales of wind. The tree knows this, and commences to make provision for it while yet quite young; it is therefore the habit of the tree, in any soil or climate where it will grow, to enlarge its trunk at and near the surface of the ground. After the trees in their native forests have assumed considerable size, and are standing quite closely together, each assisting the other to some extent in bearing up against the force of the winds, this difference in the growth of the trunk as between its top and bottom measurably disappears.

The Sequoia, like other trees, can never attain to that great height when grown singly in open ground, that it would in compact forest form, where each tree is striving to overtop its fellow in its race for sunlight; nor can we hardly expect it to find as genial a climate around the bay of San Francisco as in its native wilds.

Constitutional Convention meet in that city next summer; but such benefit would be at the expense of the balance of the State.

REDUCTION WORKS are needed in Montana, and the *Montanian* says a splendid opportunity is offered for investment in this line within fifty miles of Virginia City, M. T. To properly complete sampling works, amalgamating works, concentrating, matting and smelting works, with store-houses for ores, would cost some \$300,000, and a company is wanted to take hold of the matter. A good location is pointed out in the Beaverhead river, which is convenient to a large extent of country. If placed there, abundant water is available, and there are more than twenty different mining districts within from ten to fifty miles. The following are among the list of districts that would supply such works at the point named: West of the Beaverhead river, Bannack, Blue Wing, Argenta, Birch Creek, Bryant, Vipond, Moose Creek, Highland, Rochester, Iron Rod and Silver Star; east of the Beaverhead: East Silver Star, Bear Cañon, Wisconsin, Mill Creek, Ramshorn, Bivins, Junction, Granite, Fairweather, Highland, Pine Grove, Summit, Brown's Gulch, Williams' Gulch, Ruby Mountain and Silver Belt. The supply from these alone would be only limited by the capacity of the works, and the richness of these ores is already demonstrated.

RUSSIAN MINES.—The *Golos*, one of the leading daily papers of St. Petersburg, publishes a Government report, giving the production of minerals in Russia in 1871; according to that report, the yield was 105,928½ troy pounds of gold; 36,579½ troy pounds of silver; 102,882 tons of copper; and 817,010 tons of coal.

Coal in California.

The production and consumption of coal on this coast show a rapid increase. The California mines at Mount Diablo have been in operation since 1860. The production of these mines for the past two years has averaged 175,000 tons per annum, against 130,000 tons per annum for the previous five years and 47,000 tons annually for the first six years of their operation. This coal is mostly used for steam purposes by local manufactories and the hay and coast steamers. It is the lowest priced coal in this market, selling at \$6.25 for fine and \$8.25 for coarse. These would be considered good prices for the best hard coal in Atlantic cities. The mines at Mount Diablo are the only ones worked to any extent in this State. Other coal deposits have been reported from time to time in various sections of California, but their importance has not warranted any great outlay of labor and capital in developing the same. One of the greatest drawbacks to local manufactures is the want of cheap coal. The only motive power we have is steam, and this costs more here, perhaps, than in any other city in the United States. Whoever succeeds in furnishing San Francisco with good and cheap coal will add much to her material prosperity. All other supplies of this article are obtained from points outside of California. The other Pacific coast mines from which we draw are at Coos Bay, Bellingham Bay, Seattle and British Columbia. The Coos Bay mines are located on the Oregon coast, and have been in operation from twelve to fifteen years. However, up to the beginning of 1868, the production was less than 3,000 tons per annum. During the past six years, the yield has averaged 24,200 tons per annum, and for the past two years, 35,000 tons per annum. The coal from these mines is largely used for culinary and office purposes. The present wholesale price is \$11 per ton, or \$14 for retail lots delivered. The Bellingham Bay and Seattle mines are in Washington Territory. Some of the earliest Pacific coast supplies were obtained from the former mine. The yield for the past fifteen years has been irregular, varying from 5,000 to 21,000 tons annually. From 1868 to 1871 inclusive, the mines turned 17,000 tons per annum. A fire in the mine in 1872 stopped operations. During the past year the yield has been the largest in the history of the mine, amounting to 21,200 tons. This coal sells at \$8.50 from ship, and is used for all purposes. The Seattle mines were opened in 1871, when they sent to this market 4,900 tons. In 1872 we received 14,800 tons, and in 1873, 13,600 tons. None has been received for some months, but operations are expected to be renewed soon. This coal bears the same price as Coos Bay, and is largely used for domestic purposes. The only other domestic coal on this coast comes from Wyoming Territory, and is called Rocky Mountain. It is brought by rail, and on account of high transportation expenses, only limited quantities have been received, say 1,000 tons in 1871 and 1,900 tons per annum for the past two years. The price by the carload is \$15 per ton, retailing at \$17. The ashes from this coal are like wood ashes and there are no cinders. Were it possible to retail it at \$13 or \$14 per ton, it would be largely used in houses and offices. There are two mines in British Columbia, one at Nanaimo, formerly operated by the Hudson Bay Company and from which we receive our principal supplies of that description, and the other at Departure Bay. The latter mine was opened a few months ago, and several cargoes have been received here. The coal is known as Wellington, burns freely, makes a hot fire and consumes slowly. The retail price is \$17 per ton. The coal from the Nanaimo mines is largely taken by the Gas companies. From 1860 to 1863 inclusive, our receipts of British Columbia coal amounted to 6,900 tons per annum. During the past ten years, the receipts have averaged 18,000 tons per annum, and during the past two years 28,000 tons per annum. In 1871 we received one cargo of anthracite coal from Queen Charlotte Island, British Columbia, the first of that description mined on this coast. The quality, however, was inferior, and the expense of working too heavy to proceed, and operations were accordingly suspended. It is said that there are abundant anthracite croppings in Alaska, but investigations so far do not justify active mining operations there. At present all our hard coal comes from the Atlantic States, chiefly from Pennsylvania and Maryland. During the past two years we have received 13,000 tons of Anthracite and 9,000 tons Cumberland per annum. The steady increase in the consumption of Pacific coast coal has been largely at the expense of Eastern mines. There is a special demand for Cumberland, which is not met by any other kind, but all other descriptions of Eastern show a marked falling off within a few years. From 1860 to 1864 inclusive, our receipts of Eastern anthracite coal averaged 36,500 tons per annum. During the two following years only 34,000 tons was received. From 1867 to 1870 inclusive, there receipts averaged 31,000 tons per annum, while during the past three years the average has been only 15,000 tons per annum. Our supplies of foreign coal, outside of British Columbia, are chiefly obtained from Australia and the United Kingdom, with occasional cargoes from Chile. In 1861 we received 12,500 tons from Chile, and in 1867, 15,000 tons. However, outside of those two years the receipts from that source have not averaged over 3,500 tons per annum. The supplies from the

United Kingdom have been quite irregular, varying from 7,000 to 54,000 tons per annum. Up to the beginning of 1868, the quantity received from Europe scarcely averaged 13,000 tons per annum. During the past six years, the average has been 35,500 tons per annum, reaching 52,600 tons last year, notwithstanding the high prices in the primary markets. The receipts from Australia last year were 96,000 tons and 115,000 tons in 1872. In 1869 and 1870, we received 75,000 tons and 84,000 tons respectively, and in 1866, 54,000 tons. The receipts for other years since 1860 have averaged only 22,000 tons per annum. A large portion of the coal received here of late from Australia and the United Kingdom, had been on account of ships anxious to come here to take wheat. The annual receipts of coal at San Francisco from all sources since 1860 are annexed:

	TONS.		TONS.
1860	77,600	1867	248,900
1861	116,200	1868	282,000
1862	120,500	1869	329,000
1863	135,000	1870	320,500
1864	167,300	1871	315,200
1865	150,100	1872	434,500
1866	192,600	1873	454,600

These figures are from the *Commercial Herald*, and show an average of 240,000 tons per annum for the period named. The consumption for the past two years has averaged over 400,000 tons per annum. Much of this increase is due to the augmented demand from manufactories and to the multiplication of gas companies in the interior cities of the State. We shall probably want nearly 500,000 tons during the current year.

Robinson District.

Although but little work has been carried on in this district for some weeks past, particularly since the shutting down of the mill, matters are assuming a more cheerful aspect as regards the future of the same. We are informed on reliable authority that there are now four companies at work near Mineral City, all employing more or less men, and at Hercules Gap, some six miles from town, and a number of men in the adjacent districts of Nevada, Ward, Lake, etc. The Hayes and Watson companies are extracting ores in considerable quantities and getting it ready for the mill, which, we are informed, will soon be in operation. It is said that the Canton Company's mines will be started soon under new management, and that a large mill will be erected on the property in place of the present furnace. We are in possession of the name of the gentleman who will assume control of the property, but are not at liberty at the present time to make it known; still are satisfied in predicting for him a success, if such is possible. However, we are assured that the value of the ore in these enormous mines will be thoroughly and completely tested, and made to yield all that can be got from them, which is exactly what is required to give the really meritorious district a prominence such as it deserves.

Much interest is being manifested in copper ores there just now, and it is confidently believed that a company is being formed with a view of erecting furnaces, looking forward to the matting of this mineral. "It's always darkest just before day," is a proverb applicable to the interests of our Robinson neighbors. In our view the present status of the district is far more encouraging than was that of the now flourishing town of Eureka in '69, and no doubt can exist among men acquainted with both localities that a larger amount of ore is absolutely in sight in Robinson District than was the case at Eureka as late as 1871. Our faith has never flagged in the future of the subject of our item, but, on the contrary, has been constant and firm from the first, and we have no hesitation in saying we believe that time will reveal the facts so often set forth by us relative to the eventual richness of Robinson District. We are informed that the mill will soon be started on ore from the Hayes & Watson Company's property, and that the erection of the mill proposed to be built by the Canton Company will shortly be commenced. Our neighbors have struggled long and manfully in their endeavors to wring success from the stubborn mountains and it is with pleasure we perceive indications of a glorious consummation of all their hopes.—*White Pine News*.

THE CALISTOGA MINE.—A Calistoga correspondent of the *Register* writes: The workmen in the silver mine at the St. Helena mountain have discovered a rich deposit of sulphuret, samples of which have been sent to Mr. A. Badlam, in San Francisco, and the assayer's certificate returned yesterday shows: Silver, per ton, \$93.57; gold, per ton, \$20.17; total, \$113.74. This rock was taken from a depth of 120 feet, and the quality of the ore, such as sent, is almost unlimited. This last development settles the question as to the value of this mine. Reduction works will be erected as soon as the weather will permit. I learn from a gentleman just down from the Missouri mine, that they have got their return to work, and, in the language of our informant "quicksilver is coming out in a stream as big as a rye straw." This mine is a fortune to its owners, Messrs. Sturdt, Elder & Bartlett, who intend putting up more extensive works as soon as spring opens. They have secured the services of Mr. Harris, an old Almaden miner, as general superintendent, and you may soon expect to hear of something "big."

South African Gold Mines.

A correspondent of the *Piöche Record* says: Thinking that a little information regarding the recent gold discoveries along the east coast of South Africa would interest many of the *Record* readers and many of my friends and acquaintances who have heard me speak of my recent travels through a section of that far-off continent, for the general information of all, I will proceed to give a few extracts and details of that, the original land of Ophir, from a letter received from that country, a portion of which was published some time since in the *New York Herald*.

The three principal gold fields are (in order as discovered) first, those of the Fat river, on the borders of Matabilli land, some 1,000 miles or so inland. The gold is found in quartz reefs, which are reported to be very rich, but very hard to work, it requiring a great deal of labor and capital to work them successfully. Next come those of Marabastadt, 120 miles northeast of Pretoria, the capital of the Transvaal Republic, and about 500 miles from Durban, a part of Natal. The gold discovered there is also in quartz reefs. The first reef was discovered some three years ago, and at that time created a furore on the continent. Afterwards two other very rich reefs were discovered. A Mr. Batton went to England and organized a company, which is now erecting some very powerful and expensive quartz machinery. It has a large quantity of quartz out, which is now ready for milling. It looks very rich. No "hand diggers," or "poor diggers," as they are called, can make a living there, in consequence of the gold being in hard quartz reefs. There are no alluvial deposits. One of the reefs (or what in this country would be called a lode or ledge) has been traced for a distance of 2,000 yards. It is very wide and looks very rich. Borings have been made on other parts of the field, or over an extent of some 5,000 acres, and in several places gold reefs have been struck. The gold-bearing rock is supposed to extend west southwest across the Republic.

The "poor man's diggings," or alluvial diggings, were the third and last discovery. They, also, are situated in the Transvaal Republic, in a district called Leydenburg. They are about 440 miles from Durban, and 200 miles east of Marabastadt. They were discovered about a year ago, after I left the country. The Leydenburg district, in which these new gold fields are situated, is the most beautiful and healthy part of the beautiful and healthy Transvaal Republic. It is well wooded, well watered, and the climate is delightful. There the invalid soon shakes off his sickness, the healthy man receives excess of strength, and work comes to one easily. Kafir labor, too, is obtainable. Alluvial gold has been discovered in many parts of the district, and in some places in wonderful richness. The latest and most reliable reports say, that the majority of diggers are making from half an ounce to one, two and three ounces per day, while some are doing even better. One party is known to have found 11 ounces one week, and 20 ounces the next week; another party found 15 ounces in three consecutive days, and seven ounces the following day. Nuggets of twenty pennyweights to two ounces are common. The largest nugget yet found weighed 16 ounces, 20 ounces, 23 ounces, two pounds, and one is reported to have been found weighing 45 ounces. It has been proved beyond question that the fields are payable alluvial gold fields—a veritable "poor man's diggings." Population is setting in there from all parts of South Africa. Natal is the nearest port of ingress and egress to these fields. Transportation by ox-wagon to these Leydenburg diggings from Natal is £7. Freight by same is 50 shillings per 100 pounds. Provisions, clothing and tools can be purchased at very reasonable rates at Natal.

Arrived at the fields he will have a fine country open before him, a salubrious climate to live in, and the prospects of making an independency at the gold diggings; this he may rely upon.

Other gold fields, some of which the undersigned has traveled through. Next in order come those discovered by Thomas Bains, F. R. G. S., the well known traveler, explorer and artist; but these are gold fields, which, although their value has not been so conclusively proven, may yet be regarded with great hope. Mr. Bains first discovered gold reefs in the Matabilli county, beyond the Tati, which he is sanguine will pay well. Then in the Tugela hills, in the same colony, gold reefs have been discovered, and alluvial digging are said to exist. The value of the reefs have not yet been proved nor payable alluvial found, but great hopes are entertained of both. Again, the Zulu country is said to be rich in gold reefs, which the jealousy of the natives has heretofore prevented being developed. With all these prospects before us we may well entertain bright hopes of the future mineral developments of the great but little known continent.

TIN IN JAVA.—A Siak correspondent writes the following to the *Indier*, of the 16th ultimo: In the interior of Siak very important tin lodes have been discovered. An experimental working of the mine has already taken place, which will be continued on a larger scale, and which yielded such favorable results, at first, that the best expectations as to the future may be entertained.

New Mines in Arizona.

Last April, Messrs. Stevens, Leatherwood, Marsh, Hopkins, Hewitt, Hutton, and probably one or more others did, in person or by employes, considerable prospecting south of Tucson, and made locations on the "Orn Blanco" lead. This is a vein upon which there was much work done many years ago. In some of the old cuts, large oak trees have grown since the work was done, and none now living seems to know when the works were abandoned. The "Oro Blanco" is about sixty miles a little west of south from Tucson, eighteen southwest of Kitchen's ranch and three and one-half miles from the line between Sonora and Arizona and near the source of the Altar river. Until quite recently, it was a question in which country the lode is situated. To determine its national status, about ten days ago Messrs. Hopkins, Leatherwood, Marsh, Stephenson, Bartlett and Van Alstine provided themselves with instruments and proceeded to run out the line between monuments on the boundary and found it located as before stated. They returned on Thursday, and brought cheering accounts of the prospects of the new mining settlement and work in progress there.

At this time there are twenty-two arrastras in operation. The vein is explored along its line 100 yards and at one place to a depth of thirty feet. The ore is gold-bearing and decomposed so far as yet found, and is excavated without the use of drills and powder. Many thousands of dollars have been lately taken out, and the yield is uniform from \$60 to \$100 per ton. On the 300 feet developed, the vein runs from two to three feet in thickness, and is regarded as a first-class poor man's mine. Wood is abundant and near by and pasturage for animals all that could be desired. There is water enough to run a fifteen or twenty-stamp mill, and is regarded as permanent. The weather at this time is clear and frosty, but just suited for comfortable labor. The camp consists of about forty miners and some ten houses have been built—five of which are stone and adobes. The miners have no doubts about the value of the mines, and from all appearances a very large mining town must soon grow up there.

Now that the vein is clearly demonstrated to be in Arizona the claimants intend to go about the work of mining in earnest. As we understand it, all those at work are mining by leave of the claimants named in the first of this account, but they manifest a willingness to accommodate themselves to such arrangements as the owners will accord to them.

The year 1874 bids fair to show much mining prosperity along our southern border.—*Arizona Citizen*.

NEW SYSTEM OF SCIENTIFIC CLASSIFICATION.—The *Sacramento Record* of Jan. 7 says, that prior to the Agassiz Institute being called to order last night, J. H. Stinson, of Jacksonville, Oregon, addressed in quite a lecture, the members present, upon the subject of a book he proposes to issue on modern science. The work, he said, proposes a rigid system of classification for all natural phenomena. It is applicable to all the natural sciences. It proceeds by inductive methods, which are new, and works complete formula for that purpose. By these it brings out the causes involved in any set of phenomena. The system can be used in the wheat field, in the garden, in the dissecting room, and throughout nature. It is a scheme by which results can be calculated in a manner similar to the plan upon which the surveyor acts, when after getting his data, he proceeds to determine the area of the land. After his explanation, some remarks were made favorable to the project. Rev. Mr. Bonte believed the book would be of value, and hoped the members would aid in its publication, and explained at some length where it would be of use to the world. Dr. Logan said the subject and its treatment were entirely new and worthy of serious consideration and investigation.

MINERS' PAY.—Perhaps in no two towns in the world of the same population is so much money scattered every month among the people for labor as at Virginia and Gold Hill. The *Enterprise* of the 4th says: The Crown Point Company yesterday distributed \$69,000 among their workmen; the Jacket, \$13,000; the Sierra Nevada, \$10,000; the workmen at the Eureka mill received \$7,000, and the funn has hardly commenced. To-morrow the Belcher will pay out \$80,000, and other big companies very large sums. The few companies we have mentioned pay out nearly \$200,000, and we have only named one mill and four mines, whereas we might mention twenty mines and an equal number of mills, did we know exactly the amounts they will severally distribute. Besides all the coin sown broadcast by our mill and mining companies in the shape of wages, a snug sum will in a few days be received by our people in the shape of dividends.

DURING the month of December there was reduced at the Eureka mill, Carson River, over 5,000 tons of ore. A portion of the time the mill was not running to its full capacity. This month, Mr. King, superintendent, expects to reduce over 6,000 tons. As the ore worked averages over \$70 per ton, the yield of this one mill for the month will be over \$400,000.

NEW JERSEY'S 200 iron mines yielded, last year, 670,000 tons of ore, of which 150,000 tons were manufactured into pig iron. The value of the product is about \$3,000,000. In 1867, the product of the mines was only 300,000 tons.

A Remarkably Rich Deposit.

The Dayton mining company, whose mine is situated a short distance below Silver City, have opened upon a remarkably rich deposit of gold-bearing matter. The deposit in question, where cut on the 225-foot level, is fifteen feet in width and has been followed northward a distance of from eighty to one hundred feet, when it becomes quite narrow. At the 100-foot level the deposit is about six feet in width. At the depth of three hundred and twenty-five feet a drift will soon cut the vein, it being now within from twenty-five to fifty feet of where the deposit should be found in case that it extends to that depth. Car samples taken from the deposit on the 225-foot level assay at the rate of \$600 per ton, nearly all gold. The deposit is composed of a black, decomposed matter which is perfectly "lousy" with free gold, much of it almost as fine as flour. Being fearful of losing much of this fine gold if the ore be worked by common mill process, the company are now engaged in sinking it and in a day or two will send a lot of fifty tons of it to the Anburn mill at Reno, the foreman of which guarantees that he will save all the precious metals contained in the ore. As an evidence of the astounding richness of the peculiar vein of matter developed we may state that we were yesterday shown a button of gold weighing half an ounce which was washed by pan from three pounds of the ore by Samuel Doake, of this place, and then there was so much gold left in the dirt he intends giving it a second panning. The gold was melted into the form of a button by Conrad Weigand, who pronounces the gold worth \$12 per ounce. Mr. Doake says that in digging out his sample he did not take it from one spot in the vein, and had no idea he was getting dirt so immensely rich. The yield he obtained is at the rate of \$4,000 per ton, a yield so great that it is next to impossible that there should be any very large amount of such ore in the mine. The Dayton folks appear to have struck a huge pocket and will no doubt take from it a large amount of gold.—*Virginia Enterprise*.

BUYING ORE AT THE SMELTER.—The method of sampling and trying ore at the smelter being one of interest to our readers, we have taken pains to ascertain the rule in force here, which we find to be the same as in Utah and Nevada. First, every fifteenth shovelful from a wagon load is kept separate. That pile is well mixed and then divided by means of a box with no bottom—that is, the box is placed on the floor and the ore poured over the side from the point of a shovel. The inside pile is then served in the same way, until by repeated operations it is reduced to the compass of about one shovelful. The ore in the mean time is reduced to sufficient fineness by pounding. The assay from this shovelful generally comes within ten per cent. of working process, and then incidental losses must be subtracted, and those losses are larger than is generally supposed. 1st, interest on money invested in ore and fluxes; 2d, waste in yard of ores and fluxes; 3d, lost time on stacks and miscalculations generally, under which head comes the calculation that a certain ore requires certain fluxes, and here comes the proposition that the richer ore is in silver the greater the risk in smelting. Lead ore is what we want now to make the smelting business a success, and we hope our miners will not be backward in furnishing it at a fair assay value.—*Helena (Montana) Herald*.

BARATH OF THE NEVADA UPAS.—Billy Anderson, the well-known lawyer, who is now in this city, and who for some years (since 1868) has been a resident of Eastern Nevada, gives a startling account of the effects of the poisonous fumes from the smelting furnaces there in use. He speaks particularly of the town of Eureka, where these furnaces are very numerous and are scattered through the village. He says that in approaching the place a smell resembling that of garlic can be detected at a distance of at least three miles. Often the smoke and fumes hang over the town in clouds so dense as to resemble a London fog, and the smell of the poisonous gases is almost unendurable. Kittens and puppies die soon after coming into the world, and it is found impossible to rear these animals in the place. A sheet of white paper laid in the open air and left over night, will be covered with a thick white crust. The arsenical fumes mingled with those of lead and other minerals, more or less affect the health of all who reside in the town. Some are but slightly affected, while others suffer very severely. The poisonous atmosphere of the place not only affects the physical but also the mental health of many, causing them to become morose, nervous, and in some cases, wandering in mind.—*Enterprise*.

MINERS' WAGES.—The scale of prices for day labor, is slowly but steadily falling in all the mining districts of Colorado. Miners may complain of this, and endeavor to stay the fall by strikes and other devices peculiar to their guild, but we think they will be struggling against long odds, and playing a losing game. Wages have, up to the late financial trouble, been higher in Colorado than in any other territory of the United States, Montana perhaps excepted, and the tendency to lower them is an indication that the business of mining is assimilating itself more closely in character to the other various producing industries, where lower compensation is paid for manual labor.—*Colorado Mining Review*.

Cherry Creek.

The White Pine News says: Letters received from old residents of Hamilton regarding this new section of country contain much that is encouraging in the future, but represent the present aspect of affairs as dull, with a fair prospect of continuance for some time. The severe storms of the past few weeks have retarded all kinds of work, particularly mining, and has kept matters at a standstill. Building has almost entirely ceased, only on account of the weather, every one quietly waiting for the spring, to resume operations. There can be no doubt of the future of Cherry Creek, as many mining operators are simply awaiting the coming of good weather to commence active operations. The parties who have bonded the Chance mine have purchased a mill site with water privileges about one and a-half miles north of the town, and intend soon commencing the erection of a 20-stamp mill on the same. It is generally thought that the money for the mine will be forthcoming before the bond shall expire.

The means of communication are, a stage line every other day from Hamilton, run by Travis & Co.; another from Toano, semi-weekly, fare \$15; Woodruff & Ebnor's line from the Wells, carrying mail and express every other day; and a line from Eureka once a week. So it can be seen that the means of communication are plentiful, making it an easy matter for persons desirous of visiting the new camp to do so. Taken altogether, from the best information obtainable, next spring will show remarkable activity at Cherry Creek, with, we trust, splendid results. The town is described as being of considerable size, with a population of some three hundred men, which number is considerably increased by many prospectors and mine owners in the hills near at hand. The old town of Shellburn is described as being almost entirely deserted both in population and buildings, having all left for Cherry Creek. Being distant only eighteen miles from each other, the old prospects of the former camp can still be looked after and made to accrue to the advantage of both places.

AN EFFICIENT ARRANGEMENT.—The fire-extinguishing apparatus of the Crown Point, Kentucky and Yellow Jacket hoisting works is the most efficient arrangement in Gold Hill. From the immense tank or reservoir on the steep hillside, north of the Crown Point Ravine, above the Bowers Grade, heavy iron pipes lead the water down to each of the hoisting works mentioned. Hydrants are placed at various advantageous points about the works, and each company being well provided with carbolized hose and the proper nozzle, it is but a minute's work to run out the hose, attach it to a hydrant and directly have a big stream sent with immense force for hours upon any fire in the vicinity—a stream which never can tire or exhaust for a moment while there is water in the great reservoir—a stream which merely requires to be directed and which is powerful enough to almost tear a house to pieces or wash it off the hillside. With such an immense fall as can be obtained, and a larger pipe, the town water works and hydrants ought to be more effective than they are and fully as much as those of the mining companies we have mentioned.—*Gold Hill News*.

MINING EXPERIMENTS.—A series of experiments have been strangled by her Majesty's Inspectors of Mines, for the purpose of testing the practical value of a French invention known as the aeroplane, or the Denay-Rouze mining apparatus. By means of this, and encumbered with a weight of no more than eight or ten pounds, it is said that a man may penetrate at once to a great distance into a pit filled with choke-damp, smoke, or gas of whatever nature or density, remain there for several hours, carry a lamp with him without danger, and have free use of his arms. Its first trial in England has been arranged to take place in the Wigan coalfield, and the well-known fiery nature of the mines in that district will afford the opportunity of a really practical test.—*Mining World*.

The Mineral Point, Wis., *Tribune* notes with satisfaction the revival there of copper mining, which twenty-five years ago was an important industry in Mineral Point. Samples of ore raised have been tested in England, and found to yield 20 to 50 per cent. of metal, far above the average of English ores.

In the northern and westerly divisions of South America the silver production has latterly been insufficient to meet the requirements for currency, and the article has attained a slight premium compared with gold.

HEALD'S BUSINESS COLLEGE
BRYANT & STRATTON
24 POST ST. SAN FRANCISCO
SEND FOR CIRCULARS

The object of this school is to impart a thorough education in business affairs. It is open to persons of both sexes and of all ages. There is an English Department for those not sufficiently advanced for the Business Course. Sessions continue day and evening throughout the year. Students can enter at any time. All wishing to be successful should secure a practical education at this College. Send for "Heald's College Journal," and learn full particulars. Sent free to all by addressing E. P. HEALD, Pres. Business College, San Francisco, Cal. 2v27-1y

A NEW BOOK.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years: Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, \$10.50; in leather, \$12 (currency). Forwarded by mail for 60c. extra, by

DEWEY & CO.

JUST PUBLISHED.

Froiseth's New Sectional, Topographical and Mineral

MAP OF UTAH.

SIZE, 40 BY 56 INCHES; SCALE, 8 MILES TO AN INCH.

Handsomely engraved on stone, colored in counties, and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all GOVERNMENT SUBSIDIES made to date. Price, mounted, \$8; Pocket form, \$5.

—ALSO—

New Mining Map of Utah.

Showing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake City. Price, pocket form, \$2.50.

—ALSO—

Froiseth's New Map of Little Cottonwood Mining District and Vicinity.

Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price \$3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LEONARD BROS. & MANSUR, San Francisco. 10v25-1f

the storms, placer miners have been taking out big pay at Weaver and on Antelope hill.

Plenty of water is now running in Lynx, Big Bug and Hassayampa creeks, and the miners are slicing with good results.

Colorado.

STAVOK IT RICH AGAIN.—Mr. C. B. Vaughan has been engaged for nearly eight months in running a tunnel to strike his ledge, the Little Jenny, situated in Vanghan's gulch, Upper Ten Mile, with the object in view of again coming upon the rich deposit of ore which he found about a year ago. During this time, however, he has also been carrying on developments on other portions of the lead with more than average good results, and has made one shipment of ore to San Francisco. A few days ago the lower level struck the streak, and an assay which went \$2,586 per ton has been received. There is about 70 ft. of it to stope out, which, should it average even one-fourth as much as the above assay, will make Mr. Vanghan a snug little competency. He last summer shipped through the First National several tons of ore to Freiberg, Germany, which averaged within a fraction of \$800 per ton, and several tons of his San Francisco shipment averaged \$1,000 per ton. We understand that Mr. Vaughan intends hereafter to ship all of his richest ore to Freiberg. He has on the dump-heap and in his ore-house several hundred tons of low grade ores, running from \$70 to \$200 per ton, and about 18 tons in store, which averages \$170 per ton. On the whole, we believe this to be the richest strike in lead mining ever made in the Territory, and we heartily congratulate Mr. Vaughan on his good fortune.

Idaho.

MINING AFFAIRS.—Cor. *Statesman*, Jan. 8th: At Rocky Bar, the Pittsburg & G. M. Co. are working day and night on the "Ida Elmore," upon a very fair quality of ore.

Mining affairs may be said to be improving rapidly. A report has just come that at "Red Warrior" yesterday, Messrs. McNally & Thomas made a rich strike in the east tunnel on the "Wide West" that exceeds in richness anything heretofore ever discovered in that valuable mine. Parties are working on various other mines, such as the "Idaho," "Vishnu," "General Grant," and other ledges.

The Ellis Vapor Engine.

A letter from Haskins Machine Company, of Fitchburg, Mass., forwarded to us by the inventor, states that the system has been introduced into the works of that corporation with every success. The machinery of the establishment is operated by a six by nine steam engine, under a pressure of sixty-five pounds. With the exhaust from this engine, the bisulphide of carbon is boiled, and with its vapor a second engine, of eight inch cylinder by eleven inch stroke, is actuated. The power is not only applied to the immediate use of the factory, but is conveyed by means of a two hundred and fifty-four foot wire cable to a neighboring establishment. For this service the company receives a sum about equal to that which it costs to produce the steam for the steam engine, so that which would otherwise be clear waste is here turned into gain. It is further stated that the vapor engine, when once in complete order, worked with literally no stoppages, other than were desired, and that the total leakage, for a period of over four months, was less than one gill per twenty-four hours. At the expiration of the whole time in which the machine was in continuous use—about eight months—the manufacturers, desiring to replace it with one of newer and more improved form, sold it for cost price, a careful examination of all its parts by the purchaser, proving that no portion had become deteriorated or injured.

As regards the bisulphide of carbon employed in the boilers, we learn that the Vapor Engine Company have erected works for its manufacture, and are prepared to furnish it to consumers at one dollar per gallon. The same concern also supply the vapor engine with their fixtures, etc., in all sizes; and guarantee that a combined steam and vapor machine will give a certain horse power, with half the fuel required to produce the same power with the steam engine alone.—*Scientific American*.

A WALLA WALLA paper, of a late date, says: "We learn that several of our citizens, practical mechanics, propose to form an association for the purpose of building a steamboat, rigged with the necessary pumps to raise water required for working the bars on the Columbia River. For years it has been known that the bars all along the line of the river were rich in gold, but, owing to the difficulty in obtaining water at the required head, these bars have never been worked to any great extent."

FUEL.—In Virginia and Gold Hill coal retails all the way from \$20 to \$28 per ton. Rocky Mountain coal is worth \$20 per ton in bulk and \$21 in sacks. Excelsior coal, which comes from Rock Springs, situated about 200 miles east of Ogden, retails for \$28 per ton. Split wood costs \$14 per cord; limb wood, \$15; nut pine, \$16, and stove wood, \$6.

Academy of Sciences.

At the regular meeting of the California Academy, held on Monday evening last, the following new members were elected: George W. Smiley, L. Livingston, life members; Judge S. S. Wright, W. H. L. Barnes, Dr. A. S. Hudson, Dr. Gustave Eisen, August Drucker, C. Shultz, E. Steele, E. E. Haft and A. B. Paul, resident members.

The donations to the museum were as follows: From E. P. Upton, of Castle Brothers, specimens of Japanese manufacture, embracing seventy-five varieties of tanned and preserved skins, a piece of tanned deer skin, said to be one thousand years old; *Tufa Bicornis*, an edible Chinese water nut; linen cloth with fiber; sample of tea from Mount Mohee, in China, said to be the finest made, and has been sold in this city for \$25 a pound, at wholesale; also a quantity of seeds of the teaplant in the capsules.

From E. T. Lorquin, stuffed specimens of *Pelecanus fuscus*, from the Bay of San Francisco; also specimens of *Cupidonia cupid* (the prairie chicken) purchased in this market, probably from the Rocky Mountain region.

From J. P. Dameron, specimens of lignito coal, from Lincoln and Mount Diablo coal.

From Captain John H. Mortimer, of the ship "Isaac Webb," specimens of *Halobates cerinus*, said to be the only true oceanic insect known; *Phyllosoma commune*, or glass crab; *Leptocephalus*, or ribbon fish; *Liliopa bombyx*, with fiber and ova attached; *Fucus navalis*, or Sargasso weed, entangled with byssus thread spun by the little shell-fish *Liliopa bombyx*. Three specimens of birds caught at sea; a flying fish; *Salpa pinnata*, preserved upon sheets of paper; *Veilella*, preserved upon strips of glass; also various other marine specimens.

From L. H. Thompson, Buff Cochon chickens, preserved in alcohol, remarkable for having four legs.

The usual regular monthly addition of scientific publications was received for the library. Mr. A. W. Chase, of this coast, read a paper on the ariferous sands of Gold Bluff, referred to at length in another column of this issue.

The President announced that the Trustees of the Academy held a regular quarterly meeting on the evening of the 12th, when the following appointments were made: Curators—General Zoology, W. H. Dall; Ichthyology, George Hewson, M. D.; Conchology, W. G. W. Harford; Ornithology, William Blunt; Entomology, Henry Edwards; Paleontology, W. A. Goodyear; Mineralogy, Theodore A. Blake.

Committee on Publications—George Davidson, R. E. C. Stearns, Charles G. Yale, Henry Edwards and Albert Kellogg, M. D.

Committee on Foreign Publications—A. B. Stout, M. D., H. N. Bolander, Emile Durand, J. F. Lewis, Dr. Behr, J. M. Smyth.

The Academy having effected a lease of the church on the corner of California and Dupont streets, the next meeting will be held in their new quarters, the collections, etc., having been removed from the old rooms. This is another evidence of the increasing vitality of this Academy.

Borax.

This important article of our native products, says the *Commercial Herald*, begins to assume its proper place in exports, both crude and refined being extensively dealt in; prices of refined now 12½¢/lb. The concentrated is being shipped to New York in quantities for refining. Sales for the week, 500 cs refined, private. The price in London has recently declined 20 per cent.

NEW BELTING.—Our attention has been called by the managers of a large industrial establishment in this city to an improved belting for machinery manufactured by Thomas J. Rorer, of 112 North 3d street, Philadelphia. This consists of two or more thicknesses of leather, between which one or more layers of heavy cotton duck are placed, and the leather and duck riveted or stitched throughout the entire belt. The canvas is thoroughly stretched by machinery, previous to its use in the belting. At the recent fair of the American Institute, in New York, a ten-inch belt of this kind was seen driving a large portion of the machinery exhibited. It attracted a large amount of attention, and the advantage over ordinary belting in the almost perfect non-stretching qualities, was unqualifiedly spoken of by experts, who have given much attention to this branch of machinery.—*Journal of Farm.*

Interesting American Minerals at Vienna.

Under the above heading we translate from the "Oester Reichische Zeitschrift für Berg und Hüttenwesen" the following account of American minerals, exhibited by G. Kustel, at the Vienna Exposition, which were awarded a medal of merit: In the American department there is in group No. 1 a small case, No. 25, containing about 50 specimens of very interesting minerals, principally from California and Nevada, and also some from Arizona and Sonora, Mexico. So, for instance, is No. 48 a specimen of copper ore from Sonora, Mexico, with a singular glance-ore on it, a combination of copper and lead, in appearance similar to "Roehren Blei Erz," (a sulphuret of lead). It is foliated and has a strong glance, but has not been analysed. Another remarkable copper specimen is No. 49 from California (Silver Mountain). It shows a crystalline texture with lustrous, large faces of different angles, like a broken piece of pure antimony metal. It is black and contains \$200 of silver per ton. No. 45 is a copper silicate from Nevada, (Battle Mountain), in appearance exactly like a light-green slag of an iron blast furnace. No. 41 represents a beautiful specimen of metacinnabarite from California. Another new mineral is No. 47, a zinc blende, rich in sulphur; it not only evolves much sulphur in a closed glass tube without decomposition, but the sulphur flows out, if heated with the blow pipe, even from the specimen. It is reddish-brown and occurs at Lone, Nevada. No. 2 is a yellow translucent mineral which reacts strongly of tellurium and for which Mr. Kustel proposed the term "tellurium blende." The ore to which this mineral sticks and which is impregnated with small scales of the same mineral, is very rich in silver carrying telluride of gold at the same time, assaying \$12,700 in all per ton.

Still richer is another similar specimen, No. 17. It is found in Nevada, (Jefferson Canon). No. 3 excels by exposing several tellurium compounds, as tellurides of lead, of silver (Pezit), of nickel and free gold. Especially interesting is No. 7, a constellation of 10 or 12 specimens showing the gradual change of fahlerz into stede-feldite which Mr. Kustel exhibits as "probable transition." The first piece is pure silver fahlerz from Belmont, Nevada; the last one pure stede-feldite, and the intermediate ones show the gradual change. They are all from the same place. No. 22 is an antimony compound of a yellow color, probably a silicate. No. 27 is a variety of stembergite, that occurred on Gold Hill, Nevada. It agrees in composition with the stembergite, but not in the physical properties. No. 26 is a light-yellow silver ore, considered to be antimonial silver-lead oxide, occurring frequently in Nevada. No. 19 presents two pieces of gray lead-oxide from Arizona, similar to massive gray carbonate of lead which, according to Kustel's opinion, is transformed like the stede-feldite from a sulphuret through carbonate into an oxide. The transformation can be traced also here in a similar way from galena with a gradual change into the oxide. Besides these specimens there are exhibited beautiful horn silver ores, miargyrite, stephanite, bromic and iodic silver specimens, etc.

COKE FOR SMELTING IRON.—Dr. Hoffman communicated to a recent meeting of German engineers a method for desulphurizing coke. It consists in extinguishing the coke as it comes from the ovens, with water having chloride of manganese in solution. The sulphur passes off sulphuretted hydrogen, while manganese and the excess of chloride of manganese remain, forming an advantageous addition to the coke for iron smelting. Chloride of manganese is a waste product in many factories of bleaching salts. It is understood that the process will be tried on a large scale.

A BRIDGEPORT, (Conn.) man has invented an entirely new plan for constructing railroad cars. The model is constructed of brass tubing; the only wood used is in the flooring of the cars and the platform of the trucks. The cars are to be covered with metal, and if necessary, nickel-plated. There is a guard connected with the trucks, which, it is claimed, will prevent a train from running off the track.

ARIZONA has received from one firm in Yuma over one million and a half pounds of freight in two months.

The amount of gold dug in California since 1843, is \$1,380,700,000, of which \$93,000,000 was mined in 1853.

THE CARSON RIVER is "up" and all the mills are working on full time.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Jan. 20, 1874.

FOR WEEK ENDING Jan. 6th, 1874.

WATER MOTOR FOR SEWING MACHINES.—Oscar J. Backus, S. F., Cal.

MEDICAL COMPOUND.—Peter Hunter, Corvallis, Oregon.

SECTIONAL CAM.—John F. Mallinckrodt, Middle Boulder, Colorado.

SEED SOWER.—John B. Nixon, Cottonwood.

BOO CARRIER.—Maurice A. Franklin, San Bernardino, Cal.

"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency."

MAJOR M. A. BALDWIN, head of the Baldwin Exploring Expedition, which very recently has been prospecting in southern Utah, is in this city.

THE MILL built at Shellburn last year by the Tehama Company is to be removed to Cherry Creek. This looks well for Cherry Creek and bad for Shellburn.

THE Eberhardt and Aurora mill, formerly the International, at White Pine, is working well and turning out bullion.

PAIN-KILLER!

FOR OVER THIRTY YEARS

Perry Davis' Vegetable

PAIN KILLER

HAS BEEN TESTED IN EVERY VARIETY OF CLIMATE, AND BY ALMOST EVERY NATION KNOWN TO AMERICANS.

It is the constant companion and estimable friend of the missionary and the traveler, on sea and land, and no one should travel on our Lakes or Rivers without it.

It has been before the public over thirty years, and probably has a better and wider reputation than any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the Pain-Killer; but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful whether used internally or externally, and it stands to-day unrivalled by all the great catalogue of family medicines. It is sufficient evidence of its virtues as a standard medicine, to know that it is now used in all parts of the world and that its sale is constantly increasing. No curative agent has had such wide spread sale or given such universal satisfaction. It is a purely vegetable compound, and perfectly safe in unskilful hands.

After thirty years trial, it is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and respectability. Physicians of the first respectability, recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, &c., but for Dysentery or Cholera or any sort of Bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

Beware of all Imitations.

The Pain-Killer is sold by all respectable druggists throughout the United States and foreign countries.

Prices—25 cents, 50 cents and \$1 per bottle.

PERRY, DAVIS & SON, Proprietors, 1241 No. 136 High street, Providence, R. I.

THE SCIENTIFIC PRESS.—The San Francisco Mining and Scientific Press entered upon its twenty-eighth volume last Saturday. The Press is one of the most useful and valuable papers published on the Pacific Coast, and richly merits a liberal patronage. Its subscription price is only \$4 a year, and it is well worth that amount to any one who can appreciate it.—*Amador Dispatch*, Jan. 10.

TAKE UP YOUR LINE of march for Crittenton's, No. 7 6th Avenue, all ye coughers and wheezers, and snufflers. It is the depot for Hale's Honey of Horehound and Tar, which for all ailments of the lungs and their air passages is an immediate and sovereign remedy. All Druggists keep it. Pike's Toothache Drops cure in 1 minute.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO., J. B. Roberts, 35 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

PHOTOGRAPH PAINTING done in the most satisfactory manner at 426 Kearny street, from the smallest card to full life size, on very moderate terms by EMILY R. EASTMAN, Artist, 426 Kearny street, San Francisco.

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine, San Francisco.

D EWEY & CO.,

American and Foreign

Patent Agents.

No. 338 Montgomery St.

SAN FRANCISCO,

Patents Obtained Promptly.
 Caveats Filed Expeditiously.
 Patent Reissues Taken Out.
 Patents Secured in Foreign Lands.
 Assignments Made and Recorded in Legal Form.
 Copies of Patents and Assignments Procured.
 Examinations of Patents made here and at Washington.
 Examinations made of Assignments Recorded in Washington.
 Examinations Ordered and Reported by TELEGRAPH.
 Interferences Presented.
 Opinions Rendered regarding the Validity of Patents and Assignments.
 Rejected Cases taken up and Patents Obtained.
 Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.

SEND FOR CIRCULAR.

SHAREHOLDERS.

TRUSTEES, and

SECRETARIES of

ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Mining and Other Companies.

On to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Diamond Silver Mining Co.—Notice.

A meeting of the stockholders of the Diamond Silver Mining Company, of Tintic District, Juab County, Utah Territory, will be held on Wednesday, the 18th day of February, 1874, at one o'clock p. m., at Sherman's Building, No. 606 Montgomery street, Room 12, for the election of Trustees for the ensuing year. The subject of levying an assessment upon the capital stock of the company will also be determined.

By direction of the Board of Trustees,
 WM. SHERMAN, President.
 O. C. MILLER, Secretary.
 San Francisco, Cal., January 12, 1874. ja-6t

Commercial Coal Mining Company, of

San Francisco. Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of December, 1873, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, room No. 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 26th day of February, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

S. B. HANSON, Secretary.
 Office, No. 402 Montgomery street, room No. 23, San Francisco, California. de20

Notice—Stockholders of the Hecker-

dorn Gold and Silver Mining Co. are requested to call at the Secretary's office and exchange their old certificates of stock for the new.

PAUL J. ROBERT, Secretary.
 Office, 620 Washington street, San Francisco.

Cupel and Tiger Silver Mining Company.

Principal place of business, San Francisco, Cal. Location of works, Wallapai Mining District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of October, 1873, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees made on the twenty-seventh day of October, 1873, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the Company, Room No. 12 Express Building, San Francisco, California, on Wednesday, the twenty-third day of December, 1873, at the hour of 12 o'clock m. of said day, to pay delinquent assessments thereon, together with costs of advertising and expenses of this sale.

O. J. EATON, Secretary.
 Office removed to room No. 7, same building, San Francisco, California.

POSTPONEMENT.—The above sale is hereby postponed until Monday, January 26th, 1874, at the same hour and place. By order of the Board of Trustees.
 C. J. EATON, Secretary.

Mina Rica Silver Mining Company—Location

of principal place of business, San Francisco, California. Location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of January, 1874, an assessment of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at his office, No. 116 Leldesdorf street, on Monday, the 9th day of February, 1874, at the hour of 1 o'clock p. m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.
Dutch Flat, August 1 1873. 6v27-2m

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; food constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valve to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 200 blows per minute, in a mortar provided with screens on both sides, and crushes 750 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, \$800.

 per ounce Troy at different degrees of fineness, and val-
 uable tables for computation of assays in Ores
 and Minerals, will be sent free upon application.
 7v25-4f **JOHN TAYLOR & CO.**

Varney's Patent Amalgamator.

These Machines Stand Unrivaled,
 For rapidly pulverizing and amalgamating ores, they
 have no equal. No effort has been, or will be spared
 to have them constructed in the most perfect manner
 and of the great number now in operation, not one has
 ever required repairs. The constant and increasing de-
 mand for them is sufficient evidence of their merits.
 They are constructed so as to apply steam directly
 into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.
 The pan being filled, the motion of the miller forces
 the pulp to the center, where it is drawn down through
 the aperture and between the grinding surfaces.—
 Thence it is thrown to the periphery into the quicksilver.
 The curved plates again draw it to the center, where it
 passes down, and to the circumference as before. Thus
 it is constantly passing eregnow between the grind-
 ing surfaces and into the quicksilver, until the ore is
 reduced to an impalpable powder, and the metal amal-
 gamated.

Settlers made on the same principle excel all others
 They bring the pulp so constantly and perfectly in con-
 tact with quicksilver, that the particles are rapidly and
 completely absorbed.
 Mill-men are invited to examine these pans and settlers
 for themselves, at the office, 229 Fremont Street,
 San Francisco

Important to Miners and Mill Men.

SAN FRANCISCO METAL MARKET.

WEDNESDAY M., Jan. 21, 1874.

The metal market is quiet, and will remain so until more calls are made from builders. Mining machinery does not take very large quantities of metal at present. Quicksilver is very strong, and there appears to be no reason to expect a fall. Some anticipate a still further rise.

DIVIDEND NOTICE.

SAVINGS AND LOAN SOCIETY, 619 OLAY STREET.
At a meeting of the Board of Directors, held January 6th, 1874, a dividend was declared, free of Federal Tax, of nine (9) per cent. per annum on all deposits, for the six months ending December 31st, 1873, payable on and after the 15th instant.

j310-hp-2w OYRUS W. CARMANY, Cashier.

\$5,000 PER MONTH SAVED

BY THE USE OF

HENDY'S IMPROVED CONCENTRATOR.

Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

JOSHUA HENDY, Esq.—Dear Sir:—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

- 1st. They are good sizers (no perfect concentration in pulverized ore can be effected without first sizing).
 - 2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
 - 3d. They are good amalgamators, light (feather) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
 - 4th. They require but little power and attention to run them, and with ordinary care will last for years.
- I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grase Valley; am familiar with their practical workings on the Empire Mine, Grase Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,

JAS. H. CROSSMAN, M. E.

400 California street, or Cosmopolitan Hotel.

SAVING MONEY.—The report of O. C. Hewett, Superintendent of the Keystone Consolidated mine, in Amador county, is to the effect that they have saved about \$5,000 per month by the abandonment of blunkets and the use of Hendy's Concentrators. The Concentrators have been in use there about five months and of course give great satisfaction, as they have performed their work so well.—SCIENTIFIC PRESS, Jan. 10.

The Superintendent, O. C. Hewett, reports that a saving of about \$5,000 per month is arrived at by the use of these Concentrators.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

VOLUME XXVIII
Number 5.

An Anticipated Invention.

The past fifty years have been such an era of inventions that many people suppose nothing ever was "invented" except during the past few generations. Patent offices were not in vogue in the days of the Greeks and Romans, nor for some hundreds of years after the decline of their governments. One of our national characteristics is self-conceit, and the popular idea is that "nobody but a Yankee can invent anything worth shucks." On the other hand, people are apt to over-estimate the knowledge possessed by the ancients, and attach a high degree of importance to the crudest inventions that have long since gone out of use. Now, no intelligent man, unless he is an enthusiast to whom the very name "Lost Arts" has a charm, will concede that all knowledge died with the ancients; at the same time he must allow that the phrase "Nothing new under the sun," is in a great measure true.

We are constantly meeting with proofs of the correctness of Solomon's saying. It is hardly worth while to detail even a few evidences in its favor. There have been so many lectures on the "Lost Arts" that the subject is familiar to the general public. We take occasion, however, to illustrate one anticipated invention in its crude shape, of which the present venerable system of wire tramways, such as Hodgson's or Hellidge's, is the result. The invention of the steam engine gave subsequent inventors a chance to enlarge upon and perfect the plan shown in our engraving.

The following description of the apparatus is extracted from Derhem's "Philosophical Experiments and Observations of the late eminent Dr. Robert Hooke," London, 1726: *a*, the basket to be filled; *b*, the basket emptying itself by the lower part of it hitting against the axis of the two pulleys; *c*, the filled basket passing from *a* to *b*, supported by the pulleys; *n*, *d*, the empty baskets returning without any support between the extremes; *e*, *e*, *e*, the rope carrying the filled baskets; *f*, *f*, *f*, the same rope returning them empty; *g*, the pulley at the filling end, supported by the post; *m*; *h* the pulley at the emptying end, supported by the post; *k*, and by turned the handle; *i*; *l* the to support the interposed trestles, *n*. Fig. 2.—post *b*, the two pulleys fastened on; *r*, *r*, an iron axis to be turned by *i*; *q*, a winch; *e*, *e*, the rope lying in its tapering edge, as shown in Fig. 3; *o*, *o*, the basket hung by its handles; *p*, *p*, a stick tied with packthread on the rope, *e*, *e*, *e*. Fig. 3.—*g*, *g*, the shape of the edge of the pulley, expressed in the first figure by *h*, which is grooved with a tapering groove, that may hold the rope on which is tied, *e*, the stick thrust through the handle, *f*, *f*, of the basket. Fig. 4.—*a* the rope on which is tied, *b*, the stick, thrust through the handles of the basket; *c*, *c*, the truckles' edge, hollowed with a half round, *h*, for the rope to run on.

No particulars are given as to the quantity of work performed by the actual machine, but the author says that "by this way 'tis easy to transport earth, sand, etc., 1, 2, 3, 4, or 500 yards, whether ascending or descending; and, I conceive, two men can do more than six in the common way."

DEATH OF DR. LIVINGSTONE.—Dr. Livingstone, the world-renowned explorer, died in the interior of Africa in June last. He had been traveling over a partially submerged country, and after wading four days in the water, he was seized by the illness of which he died. His perilous travels and explorations in search of the source of the Nile have been continued for many years and he has at last met his death in the field of his labors. It is hardly probable that any one can be found who will risk his life in exploring with as much persistence and self-denial as Dr. Livingstone, the great unknown country of central Africa.

SNOW SLIDES have been very destructive in the cañons of Utah during the late storms. In Big Cottonwood Cañon particularly, several avalanches are reported. Quite a number of lives have been lost.

Gambling.

We believe it perfectly legitimate to purchase the stock of any mining or manufacturing company or organization, with a view of realizing reasonable or even large profits or dividends, from development, or increased value given to products, by the labor bestowed upon their manufacture. But when we see men of probity and character, men whom it might be expected would lend all reasonable aid to enterprises which alone can give wealth and permanent prosperity to the State, turning their attention to, and using their means in simply buying one day and selling the next, the stock of some wildcat mining or other company, with no other object than buying low and selling high, building their own fortune on the ruin of their friend who may chance to be the loser, it becomes a matter of doubtful propriety if not of morality, and scarcely deserves a milder name than public gambling.

We would not, however, interpose objections solely on this ground, every man being the keeper of his own character and conscience, and the city of San Francisco is the protector of its reputation as against gamblers. But look at the ability, the energy, the business talent, the capital in money, and the great good to

The Ohio Consolidated Mine.

The Secretary of the Ohio Consolidated Mining Co., W. Aug. Knapp, has issued a circular in relation to improvements upon the company's mine for the general information of shareholders, from which we make a few extracts. The improvements have all been made with a view to permanency, and constructed at the same time on economical principles. It is designed shortly to erect an 8-stamp battery, which will enable the company to crush their own ores, particularly the low grade, of which the present shaft is expected to open up a very large amount. The drift on the vein has been sunk about 146 feet and has all been well timbered. It shows a well defined vein of nearly two feet in thickness.

"A shaft sunk upon the middle vein for hoisting purposes, and pumping, the power used being an overshot wheel of 30 feet diameter, 4 feet face, supplied by water from a ditch above. This wheel will enower to attach and drive an 8-stamp mill as well. Connected with this shaft at a depth of about 130 feet there is a drain tunnel 330 feet in length, saving the hoisting of water above the tunnel, and at the depth of 150 feet there is a cross drift of about 120 feet to the east vein, also a rise 32 feet high. N. Stope open 80 feet, which prospects

Eureka Artificial Stone.

The world has exhausted itself in the effort to produce a material which should do away with the laborious and expensive operation of stone-cutting, but until recently with very indifferent success. Those processes which were valuable, so far as excellence of product is concerned, have almost uniformly been so expensive that good artificial stone has cost nearly as much as the natural. In one notable instance this was not the case—that of M. Coignet, whose material has been used for about twenty years in France and the neighboring countries in the construction of buildings, arches, aqueducts, sea-walls, etc. It seems, however, to have been reserved for California to achieve a yet greater triumph. A young Californian, who had seen something of the success of M. Coignet's process, undertook to cheapen it, to use common and cheap materials to obtain the same chemical result, and at the same time to improve it in some important particulars.

We have often called attention to the fact that California inventors have taken a front rank, and we hope and believe it will be so in this case. Certainly it appears as if nothing was lacking in the present invention to insure the success of the company who have purchased the patent.

We visited the office of this company—the Eureka Artificial Stone Company, 304 Montgomery street—a few days ago. It is a young corporation, but composed of men of known worth and business ability, as the following list of Directors will show: M. G. Cobb, President; O. F. Gehricke, J. B. Cox, Peter Portois and G. E. Sloss. The capital stock is \$500,000, divided into shares of \$25 each. The books are open at the office for subscriptions to the stock, which is being rapidly taken.

The company propose to manufacture stone for building, for cemetery and other monumental work, for bridges, sea-walls, and for all kinds of work where a beautiful, durable, fire-proof and waterproof material is required. They exhibit at their office substantial and convincing specimens of their stone.

As a test of the non-absorbing qualities of this stone we tried an experiment at our office by sinking a hollow in a piece of the stone with a hammer and chisel, filling it with water and letting it stand for twenty-four hours. It proved itself entirely impervious, to water, none being absorbed or lost in any way except what escaped by evaporation.

Of the many advantages claimed for it, we abbreviate a few from the company's circular: "It can be manufactured cheaper than any other, no machinery or costly appliances being necessary; no soda or salt water being used in the manufacture, it does not lose its beauty by age and exposure. Piers, arches, pillars and blocks too large to be handled, can be made *in situ*; and the composition can be laid on with a trowel over brick walls, forming a beautiful and durable covering, which water cannot penetrate, needing no paint, and giving the appearance of a handsome stone front." Roofs, also, fire-proof and water-proof, have been made of it, and have given thorough satisfaction.

As we have already mentioned, stone somewhat similar to this has been used for many years in France, in the Suez Canal, and in other places. That first-class stone can be manufactured is undoubtedly true, and it appears as if our California inventor had discovered the method not only of making it, but of making it cheaply. This, after all, is the essential point, for those who take stock in an enterprise of this kind do so with a view to profit. Hence an expensive stone, however excellent in quality, would be worthless. But in this matter the inventor has had in view not the making of a wonderful scientific experiment, but of a commercial and profitable fact.

Those who wish to see and judge for themselves, can do so by calling at 304 Montgomery streets, the office of the company. The patents were granted through the Mining and Scientific Press Patent Agency.

the industries of the State that might accrue, all withdrawn, locked up in the brains and pockets of four or five hundred men daily assembling at the corners of California and Montgomery streets.

Is it any wonder that San Francisco should lose her prestige as the queen commercial city of the Pacific, or that interior projects for the development of the State's industries and interests should languish? The wonder only is, that with so much of the cash capital of San Francisco entangled in the meshes of hazardous stock speculations, there is enough left for the development of even the few industries which are now and then inaugurated in our midst.

MINING SUIT.—A suit has been brought by M. A. Wheaton, against the Le Grange Ditch and Hydraulic Mining Co., in the 19th District Court. The complaint avers that on the 4th of December, 1873, the plaintiff was the owner and entitled to the possession of a tract of land commencing at a point on the east line of the north-west quarter of Section 16, in township 3 south, in range 14 east, from Mount Diablo base and meridian. The land lies near or at the boundary line of Stanislaus and Tuolumne counties. Wheaton says that while he was the owner of the land, the defendant unlawfully ejected him. That the value of rents of the land is \$300 per day. He asks judgment for the restitution of the premises, for \$100,000 damages for the withholding, and \$100,000 damages caused by the loss of the value of the rents and profits.

CARSON MINT.—During December there were received at the Carson Mint 8,845,468 ounces of gold, valued at \$127,357.52, and 138,976,019 silver, valued at \$155,938.21. Coinage and bars executed, \$365,134.15.

over \$50 per ton. In the cross drift of E vein a large body of ore has been reached 80 feet below where it has been worked from above, and in consequence of want of ventilation and to secure greater and better facilities for working, it was deemed advisable to sink another and more substantial working shaft on this vein. This necessitated the purchase of a steam engine and boiler, together with permanent hoisting gear, etc., also the building of a house over the same for protection against the weather, storage of tools, dry wood for the engine, etc."

PLATINUM IN QUEENSLAND.—The Northern Argus states that a discovery of platinum has recently been made within a distance of 250 miles of Rockhampton. A party who had been prospecting for gold arrived in town with a small parcel of mineral deposit that to him presented unusual features. He submitted it to Mr. A. Tucker, assayer, who, after careful examination, pronounced the parcel to contain an excellent sample of platinum, with the usual combination or osmium and iridium.

GEOLOGICAL SURVEY OF UTAH.—The citizens of Utah wish for a geological survey, and a memorial has been presented to the Legislature to promote the object. The committee appointed to get up this memorial was composed of P. Edward Connor, R. C. Chambers, Henry Sewell, W. S. McCormick, L. U. Colbath, J. E. Cleyton, E. M. Barnum, C. H. Hempstead, and Albert Carrington.

TUOLUMNE county, a few years ago, produced hundreds of thousands of dollars in gold annually, but no wheat. In 1873, it produced over 5,000,000 bushels of wheat, and only \$50,000 gold.

White Island.

M. Morhange, Consul-General of Belgium in this city, gives the following interesting account of a visit to a remarkable volcanic island, known as White Island, off New Zealand, and which he described in a paper read before the California Academy of Sciences:

"When I came on deck the morning after we had left Auckland harbor, we were in the Bay of Plenty, (Whakari, as the natives call it), and White Island is situated in that bay. For hours I stood watching its gradual appearance. I saw first, in the dim distance, a mere greyish spot. After some time the spot had enlarged and assumed the vaporous shape of a column of smoke; then it looked like an opalescent cloud resting on the horizon, and so I kept it in sight for about two hours. At last it stood there as it really was. 'I was aware then' that what I took at first for the island was only the large crest of vapor which crowns its summit, for White Island is nothing less than a volcano, isolated in the midst of the sea; a perpetually active crater, which, in the course of time, like the mollusc which secretes its little shell, had built up a huge cone, $3\frac{1}{2}$ miles in circumference and 860 feet high, of indurated ashes and scoriae. The walls of this cone are perfectly straight, of a dark ash-grey color, cut at intervals with deep longitudinal furrows, and having on the northwestern side a few small patches of sparse vegetation, which resemble, when viewed from a distance, hollows in the grey walls, so that I thought they were the 'depression of the crater'; but it is inside the walls, on the eastern side. Looking north, it seems as if the base of the island had been upheaved and left deeply inclined toward the west.

As the walls rise perpendicularly from the level of the sea, I could not understand where we should find a landing place, and still less how we could ever penetrate into the interior of the hollow cone. At last two quarter boats were lowered, with our small party of eight or ten, including the captain and some officers. As we proceeded, I noticed toward the southern extremity of the island an opening, a gap apparently produced by the falling down of a portion of the circular wall. On the left rose a high pyramid of consolidated ashes. On the right stood two separate walls of the same formation, several hundred feet high, covered with a whitish crust, full of cracks, like old, dry plaster. There we landed, walking with care over a succession of boulders, accessible in smooth water, but which in a few hours would be washed by the rollers. Through the gap in the wall we entered an immense funnel-shaped circus, $1\frac{1}{2}$ miles in circumference, almost at the sea level, the walls of which were of a lighter gray inside, but ridged and striated longitudinally, like the outer surfaces. We were breathing in a sulphurous atmosphere. We trod upon a warm soil, slightly indurated, soft and crackling, full of rents and fissures. I felt as if I were walking over a floor of heated gutta-percha. In every direction were carpets of white and yellow efflorescences, hard nodules incrusting with sulphur and gypsum, narrow streams of tepid, acidulated water. Stooping down, I could easily detach from the ground sheets of the gray crust, and on examining the under surface I found them covered with native sulphur of various tints, from straw-yellow to orange and saffron, all bestrewn with fine granulations and elegant needles of crystallized sulphur. Wherever I introduced my stick a foot deep into the soil, a jet of hot vapor was emitted, so hot indeed that I could hardly hold my hand over it. Sometimes, instead of vapor, water or mud came out. In several places the ground was quite perforated, and numbers of thin jets, one, two and three feet high, poured out, condensing in little rills. The taste of this water was generally either markedly acid or alkaline.

Not a blade of grass, not a mark of vegetation, not the buzz of an insect, in this vast, gloomy solitude; but a constantly increasing noise, as of a seething sea. While we were walking on the treacherous, yielding ground, moving slowly and frequently sounding with our sticks, we were suddenly almost suffocated by a dense blast of sulphurous vapors, with a greatly intensified heat. I retreated for a few moments to take breath, and when, somewhat relieved, I looked around and recognized my companions I noticed where the pungent exhalation was coming from. It arose from a lake, in about the center of the solfatara, a boiling lake of the most gorgeous yellow green color, which I could easily compare to a sea of molten gold, combined with malachite; and all around, filling up an area of over fifteen acres, at various heights above the basin, numberless fumeroles and geysers sent up fifty or sixty feet their jets of vapor, or of boiling water, with a writhing, roaring, deafening noise, as if a hundred high-pressure engines were blowing off steam on the spot. Columns of vapor, visible in the upper part of the back-ground, far away, at a height of perhaps 800 feet, indicated the presence of other fumeroles and geysers. The captain told me that, about a year ago, there was a kind of natural sidewalk, between the lake and the foot of the walls; but it was no longer so, and we were compelled to stop, in front of the boiling sea, towards the entrance, recent eruptions having covered up the side-walks.

No description, however masterly, be it by Dante himself, could possibly convey to the imagination of those who have not witnessed it, the wild grandeur and desolate sublimity of this barren, Plutonic island. I stood spell-bound, looking about me, and so utterly be-

wildered that I seemed to have lost even the idea of time. But our kind captain had not forgotten it. There might have been some danger in a protracted visit on such a shifting ground. Besides, there was another danger, threatening from without. The swell was coming in as the tide rose, and it might have been difficult to reach our boats. It was high time, indeed, to return. We had landed dry-footed on this broken, rugged beach, but now we could not escape the roaring rollers, which tumbled upon us as we jumped from boulder to boulder.

But who would mind a thorough ducking, to say nothing of the danger, for such a glorious sight? We spent on White Island about an hour and a half; it seemed to me a few moments then, but now, in the recollection, with all its associations, I almost fancy we were there a whole day.

Lida Valley and Sylvania.

Mr. J. L. Darrah returned a few days since from a visit to the mining camps east of the range. Mr. Darrah is eminently a practical man, and while at Lida he submitted the plump question to Mr. Hiskey, manager of Hiskey & Walker's mill and mines, to know what they were doing, whether he might have an abstract of assays and working results of the ores of that section that would give a reliable idea of their average value, etc. In reply to this Hiskey told him that there was his office and books to "pitch in and copy the ore, assay and bullion books, from one end to the other if he wanted to." Darrah "pitched in," and after carefully transcribing the figures on the mill books as they were set down from day to day, the results are as follows:

The assay value of 219 samples gives the extraordinary average of \$292 per ton! One assay from the Brown's Hope, which, by the way, in the richness of its ores has not more than two or three superiors on the coast, gives a yield of \$4,351.41. This was the largest assay; the smallest, which was a simple prospect specimen, \$6.13.

The working result of 668 tons put through the mill since last March, gives an average value of \$244 per ton, or an aggregate product of \$163,000. This is certainly a showing not often excelled in any camp, and the entire statement may be accepted as perfectly reliable.

Mr. Darrah is confident that the section embracing Lida Valley, Gold Mountain (20 miles to the south) and Sylvania (15 miles west of Lida) is inevitably bound to prove itself, sooner or later, the most prolific mineral section east of the Sierra Nevada. Our own personal knowledge of the two first-named inclines us strongly to that opinion, as the number of rich silver mines is innumerable. The prospects are, however, that the newer district of Sylvania will do more to determine the status of the entire region than either or both the others, though either one is undoubtedly capable of adding greatly to the world's wealth, and of making a noise in the world in consequence.

Sylvania district has one feature worthy of special mention, even in a necessarily brief local reference: For a width of about 3 miles, and 10 miles in length, the country rock is a perfectly defined body of granite. Through the center of this streak runs another of softer and whiter rock than the granite, and again through the center of this soft rock runs a large lode of rich argentiferous galena, which wherever uncovered for full eight miles invariably yields ore identical in characteristics, one place with another, and thus proving this lead to be full eight miles long—eight miles of a lode composed of the best quality of smelting ores; superior, Mr. Darrah thinks, to those of Cerro Gordo, in the reduction of which he was actively engaged for three years.

There is the greatest abundance of timber for wood and charcoal all along the lead, and water can be obtained in numerous localities close at hand. Wood and its product, charcoal, can be furnished fifty per cent. cheaper than at Cerro Gordo; and, taking that famous locality still further as a standard of comparison, the ores of Sylvania are said to be many times more abundant, and presumed to be generally richer in silver and quite as easy to smelt; further, Cerro Gordo bullion has to be hauled 275 miles on wagons, while that from the other will be but 195. In the nature of the case, however, it may cost as much or more per ton to land it in San Francisco from Sylvania than Cerro Gordo, but in other important particulars the advantage appears to be entirely in favor of the former. Unless people's hopes are allowed to run away with their judgment, Sylvania district is surely capable of producing more bullion of a richer quality and at a cheaper rate than Enreka with its score of big furnaces. Looking at the prospects for Sylvania and Waucoha, at one end of the county, as it were, with Panamint, equally undeveloped but promising, at the other, and our present mainstay of Cerro Gordo, and other important mining operations now or likely soon to be in full blast, it strikes us that the future of Inyo is about as flattering, prospectively, as any reasonable person could desire. It is bound to be the banner mining county of this State. It needs but a narrow gauge railroad, or cheap freights, to enable it to hold its head up with the highest mineral producing county of any State or Territory. Nevada and Arizona papers will take notice.—*Inyo Independent.*

Cottonwood Canon Mines.

From the correspondence from Alta, Little Cottonwood, in the Salt Lake Tribune, we make the following extracts:

The resumption of work on the Flagstaff mine last week has had a visible effect on the times. The daily shipments of ore from the mine are forty tons. This amount is to be increased to double the quantity, if desired. The mine is now under the charge of George W. Cullins. The ore is brought down on the tramway in cars, there not being sufficient snow to run the boats.

The roads between this place and the terminus are in a splendid condition, and never was there a better opportunity offered for the cheap and easy transportation of ores from Little Cottonwood; and still, the best of our mines are lying idle, either awaiting the arbitration of quarrels in England or the adjustment of lawsuits at home.

The Vallejo Mine

Still continues to ship ore whenever required. If a good customer is found the ore is forthcoming. "Business is business," and it takes wealth to buy ore from the Vallejo.

The Emma

Is shipping about five or eleven tons per day—that is as near as one can come to the shipments, unless he keeps tally of the teams as they leave the ore house. As this procedure would not pay, a marginal guess is the best your correspondent can do. If the reports of men who are working in the lower levels are to be believed—and I can see no reason why they should not be given the fullest credence—they have undoubtedly struck the largest, richest and best-defined body of ore ever revealed in the mountains of Utah. It is said they have gone through the limestone formation, and have found a ledge thirteen feet in width, enclosed in granite walls. The ore does not require sorting, and is sacked in the mine. Hannibal Williams, the superintendent, is always at his post, and is one of the hardest working men about the mine. He always receives his visitors very courteously, and will allow them to go anywhere around the mine; but not into it. The information that one receives from him the public may rely on.

The Davenport

Mine is closed, nobody can tell for how long. It may be for weeks, and possibly for months. Lawyers, sheriffs, etc., are eating up the profits of the mine, if it ever made any. The surroundings of the Davenport look cheerless and gloomy, suggestive of bad management, either here or over the water. That as fine a property as this should be suffered to remain idle, when it is known by all the miners who have ever worked in it, and by its late superintendent—Joe Farren—that it can be made to pay large dividends on the capital invested within thirty days, is a disgrace to Utah; and is of untold injury to her mining interests. By the time Cottonwood is visited by several more European "experts," and their ideas of mining are fully carried out, Alta will become depopulated and the mines will be abandoned.

Other Mines.

The Grizzly mine has closed shipments for the winter, as the owners cannot afford to keep the roads open between the mine and Alta. The closing of the Davenport mine necessitated the closing of the Grizzly.

The City of Rocks still continues to work a few men, and the prospects of the mine are extremely favorable.

The Utah mine, now being worked by Matt. Gisborn, of Mono notoriety, is looking well, and is one of the best defined lodes in the camp.

The Wellington mine is now looking better than ever. The shipment of ore from it next season, will not probably be exceeded by that of any other in the district.

The Oxford and Geneva still continues to produce argentiferous wealth in paying quantities, but is not shipping ore on account of the high tariff charged for transportation in the winter.

Work is going on in the Fuller mine, and the indications in the lower workings were never better. The ledge still continues on the even tenor of its way, not varying far from ten feet in width. Its shipment record for this coming season promises to be large.

The McKay continues to keep up its well-earned reputation. The ledge in the incline shaft is so wide that the wealth cannot be determined until they drift across the vein. The body of ore is solid, filling the sides, bottom, top, and breast of the incline. The ore is of very high grade. Preparations are being made to ship the ore that is now on the dump.

The Victoria and Imperial tunnel company have made a rich find in the stope eighty-five feet above the tunnel level. The vein is four feet in width, and increasing daily. The tunnel is still being pushed forward, and has now reached a length of 640 feet. The indications in the breast of the tunnel are not flattering, but they are bound to strike it if they persevere.

The great excitement of Alta is the working of the Burleigh drill and patent air compressor. The machinery arrived here some weeks ago, and was placed in position and was in working order yesterday. There is no doubt of its proving entirely successful, as the manner of working this drill will be of importance to the mining men of this Territory.

ITALY has a more powerful siege gun than either Krupp or Armstrong have turned out.

Colorado's Milling Capacity.

The present capacity of the metallurgical works in Colorado is about 165 tons per diem, of which total Clear Creek county represents 50 tons; Gilpin, 25; Jefferson, 20; Boulder, 15; Park, 45, and Arapahoe, 10. This does not include the numberless stamp-mills that are scattered all over the gold bearing sections of the Territory, and which would swell the total to fully, if not over 800 tons. Against this treating capacity is a production of ore that rarely exceeds 350 tons daily, and averages throughout the year about 300, worth, taking all together, between \$50 and \$60 per ton. Of this sum about 125 tons may be considered as stamp rock, requiring simply crushing and raw amalgamation, and the remaining 175 tons as more or less refractory ore, needing roasting before being smelted into matte, run down into pig-lead, or amalgamated.

To one who has watched the progress of our ore-milling business during the past three years, a great change will have been noticed in, 1st, the class of ore handled; 2d, the system of treatment; 3d, the location of works. In 1870 the gold production exceeded that of silver by at least a million dollars; that is to say, the raise of ore chiefly valued on account of its gold. Now, the production of the two metals is at least even, with the balance probably in favor of the least valuable one. As this change has taken place, the yield of the Gilpin county mines, while it has not decreased, has increased but little, the production of the Georgetown mines has more than doubled, and the new silver districts of Caribou and Park county have sprung into prosperous existence. Gold Hill is the only new gold district that has been opened since the beginning of the present decade, and it seems quite likely that at the close of the year the production of the two metals from that point will be nearly equal. This change has thrown into the shade the stamp-mill treatment (always a costly system) and created a demand for smelting works that is ever on the increase.

The change in the methods of treatment is evinced by a tendency towards the production of matte, and especially so since the completion of the Separating Works at Black Hawk. But three companies now milling produce bullion without previous smelting, viz.: the Stewart, Masonville and Caribou Mills, while the Boston & Colorado, the Whistle, Swansea, Dudley, Alma and Golden Works produce either a copper matte or a lead product, from which the gold and silver is afterwards separated. Amalgamation, both raw and after roasting, is therefore losing place in the working of Colorado ores, and smelting gaining in favor, while battery and plate amalgamation, which scarcely saves its thirty per cent. of metal, is rapidly being done away with as concentration takes its place.

In early days it was considered necessary for every large mine to have its mill. In obedience to this idea numerous stamp mills were erected in Gilpin county, and wherever gold quartz was found; and the Brown, Baker and International mills of Clear Creek county were built. Only a few of these are now in operation, the majority having shut down for want of ore, or failed by reason of unsuccessful processes. The Caribou mill is now the only silver works in the Territory that is supplied by the product of a single mine, and even it is at present preparing to receive custom ores. It seems to have been clearly shown that mining and milling operations are seldom profitably carried on by one and the same organization, and custom works will hereafter be the order of the day. More than this, our ore mills are every year becoming congregated, as it were, around central points, instead of being scattered over the country, one for each great mine.

Black-Hawk and Golden are at present pre-eminently the two prominent smelting centers of Colorado, and by their location and connections command a larger portion of the ore supply than could any other points.

This centralization of the smelting industry is bound to proceed, as it becomes evident that the whole mountain area of Colorado is one vast mineral district, or a segregation of small ones so close together that the interest of one becomes the interest of all. We may look for the successful establishment of beneficiating works of large proportions in the neighborhood of Fairplay; at Boulder City; in Baker Park, when the San Juan district is developed; and in the valley of the Bine. The progress during the past year has been very encouraging; for not only have a number of new works sprung into existence, but the problem of profitably handling most of the refractory ores has been solved. We are now shipping away a very small quantity of ore, and no matte, which two items amount to a saving of about a quarter of a million of dollars.

In England timber is jealously guarded, and farmers have commenced to plant trees, and there are a greater number of acres under Scotch pine now than at any other period in Scotland's history, notwithstanding the immense quantity that has been cut down for lumber. Much of this pine, however, will not be available for many years, and larches are therefore being planted, as they are of rapid growth and yield good timber. The timber question should have more prominence in this country than is now awarded it.—*Am. Manufacturer.*

SCIENTIFIC PROGRESS.

Does Iron Improve With Working?

The question, "Does iron improve with working?" has had many theories in the affirmative, with little or nothing against it. We think that it can be shown that iron can be overworked while in process of manufacture, or at least between much heating and much working it can be overdone, especially by the former. The re-heating of iron lessens the amount of cinder contained in it. Simply and plainly, this is best proven by the use of old furnace tools, old grate bars, and much other old scrap iron that has been subjected to alternate heating and cooling, which, when faggoted and rolled, produces an iron of inferior quality. Next, it can be shown by the rolling of piles or blooms that have been kept in the furnace an undue length of time, till the cinder having been consumed, "dried up," as the expression is, will be shown in the rolling to have become stiff, unpliant and liable to crack, if the shape that it is worked into is very thin or of irregular form, such as angle iron, T iron, etc. Iron is overworked when it ceases to work soft and easy from the liquid cinder that it should contain. Some iron possesses more cinder than others, and that iron which has much cinder can be worked with advantage to its quality, as long as the cinder holds out; to this extent it can be improved by working, but to the point at which a lack of cinder makes it work stiffly and dryly, it will no longer improve by working.

The extent to which iron should be worked should have reference to its after use. If the iron be worked till all the cinder is excluded, and just then is at its maximum of quality, then it would be unfit for any further manipulation in the hands of the user who might require to further heat and work it to his purpose; for its maximum having been attained by heating and working until the cinder is out, it but deteriorates by any further heating and working. The more work that it takes to exclude the cinder, the more will it improve by this work, but it has reached its highest capability of improvement when this is attained. Some iron, then, is at its best by one heating and rolling while other iron is the better of a second heating and rolling. Some will improve to the third heating, but of common iron not much is of this character. This is in regard to puddled iron, but the same principle applies or governs the question as to charcoal iron. The latter being more homogeneous will endure more work; but the highest point of improvement with it also is reached, when by re-heating and re-rolling it has ceased to work soft and readily in the rolls. This is a simple and practical answer to the question of how far iron is capable of being improved by working. In the rolling of odd shapes, if the iron be kept in the heating furnace a much longer time than is necessary to properly heat it, as sometimes happens through accident or delay, the iron in rolling will not so readily form itself into sharp corners and fine angles; is liable to crack if worked into beveled edges, and is afterwards found to have suffered actual deterioration in quality of fiber. —*Levis's Pamphlet.*

Sugar in Organic Substances.

Sugar, until a comparatively recent date, supposed to exist only in certain vegetables, has more recently been found a very general concomitant of vegetable, and, to a certain extent, of animal life. It exists principally in the form of cane sugar, or crystallizable sugar, grape sugar, or glucose, and lactin, or sugar of milk. In the first form it is found most abundantly in the sugar cane, in sorghum, which is, however, in fact, only a variety of the sugar cane; in the beet, and in the sap of the maple tree, from all of which it is manufactured in large quantities. Indian corn has also been tried as a producer of sugar, and in the Patent Office reports for 1844 are given, by Mr. Webb, the results of some experiments with corn-stalks. Good sugar can be made from corn, but not in quantities to make the crop profitable, as compared with other crops which might be produced upon the same land.

The second form of sugar, is partially uncrystallizable, and exists largely in the grape, hence its name, grape sugar. It exists however, in the juice of many ripe fruits, and to it they owe their sweetness. Also, in the nectariferous glands of flowers, and in connection with another uncrystallizable form of sugar, similar to the brown syrup of the sugar cane, and with certain odorous, gummy and waxy matters it constitutes honey.

The third form, lactin, exists only in the milk of mammalia, from which it may be separated by a chemical process. By action of hot dilute acids, it may be converted into glucose. Glucose is also produced in the human organism by the liver in a healthy state, and secreted abnormally in the disease known as diabetes.

The starch of grain is, by fermentation, converted into glucose, and from this to alcohol. M. A. Petit, a French savant, has recently been examining the leaves of the grape vine, as well as other leaves, and finds they contain, besides a quantity of sugar in the intervessel state (*sucrose intervessel*), a considerable quantity of cane sugar. Cherry and peach leaves also contain both cane sugar and glucose. In M.

Petit's tests, he found that a kilogramme of peach leaves contained 33 grammes of cane sugar, and 12 grammes of glucose. It is highly probable, that sugar, in one of its forms, exists in the leaves of, at least, all fruit-bearing plants. —*Artisan.*

Gold Assays.

The following is an abstract of the report of a committee on this subject, appointed by the British Association, and read at their late meeting at Bradford:—The attention of the committee was first directed to a series of experiments which were instituted with a view to ascertain to what extent the weight of pieces of pure gold and of alloys synthetically prepared would be affected by submitting them to the process of assaying, and consequently how far the results of assay operations were trustworthy. These results showed that the maximum error was only 0.001 per cent. of the original weight of the assay piece, and consequently, that the results obtained by assaying gold, represented the composition of the portion of metal under examination to the one ten-thousandth part, a fact which would doubtless appear remarkable to all who were accustomed to the ordinary methods of quantitative analysis. The committee were not unmindful that although it was possible to attain this high degree of accuracy it was nevertheless well known that a comparison of the assay reports of different analyses as to the composition of the same, might often disclose discrepancies of five ten-thousandth parts. Portions of metal from nineteen gold ingots were assayed by the assistant assayer, and were then sent to five other assayers, each of whom furnished an independent report. The discrepancies in their reports varied from four ten-thousandth parts to one part of fine gold in 1,000 of the alloy, or an average deviation of six ten-thousandth parts.

These small variations assumed serious proportions when they affected the value of large quantities of bullion. For instance, the value of gold coined at the mint during the past year was £15,200,000, and a persistent error in the assay reports of one ten-thousandth part would have been attended with a gain or loss to the department of no less than £1,500.

The report also described the investigations which the committee had entered upon, and the method of gold assaying practised in the mint. The committee held that when widely divergent results were obtained, the gold employed by one or other of the assayers was impure, and that either the amount of impurity had not been ascertained with accuracy, or that it altogether escaped detection. It followed, therefore, that the weight of the "cornets," when compared with the initial weight of the portion of metal operated upon, appeared to indicate the presence of an amount of gold which was in excess of the true amount of precious metal present in the alloy.

The committee obtained specimens of gold from different sources, and tested them side by side with gold prepared in accordance with the directions of the Lords Commissioners of her Majesty's Treasury, by the chemist of the mint, for use as a standard trial-plate in testing the coinage. Great care was taken in the preparation of this gold, eighty ounces of which were precipitated from no less than one hundred gallons of chloride of gold; and as experiments had already shown that it was very pure, it was proposed to adopt it as the basis for a new series of comparisons; and, further, to invite assayers to submit samples of gold to be tested side by side by them.

SECCHI ON SOLAR PROTUBERANCES.—At a meeting of the French Academy, on the 3rd ult., P. Secchi presented another of his valuable notes on the solar protuberances. It tabulates observations made during the six last rotations of the sun, from the 23d of April, to the 2d of October. These show a continual decrease in the eruptions throughout the period, and whereas in the early series of 1871, the number of eruptions was, on an average, fourteen or fifteen daily, with maxima of 20 to 23, and minima which rarely fell to ten, the recent rotations give an average of only eight to nine, with maxima of twelve, and minima of four or five. P. Secchi finds something like a diurnal distribution of protuberances; opposite parts corresponding. The metallic eruptions have been few and very intermittent, one on the 18th of September was very memorable, and gave rise to a group of spots. As regards direction of protuberances the law has not been so well marked, but it has always held good, that in high latitudes, the dominant direction is towards the poles, and in low, towards the equator; the change of direction being at about 40°. In periods of calm, there is a somewhat different system of direction from that in periods of activity. Dr. Rudolph Wolf has lately published an important series of sun-spot observations in various parts of Europe during 1872.

PROF. REYNOLDS, London, states that the rate of condensation of steam is in inverse proportion to the quantity of air it contains; that the only limit to the condensation of pure steam is the power of the surface to carry off the heat; that mixing air with steam before use greatly diminishes the condensation at the surface of a cylinder, thus increasing the inefficiency of the engine; and that the maximum effect will be obtained when the pressure of the air is one-tenth that of the steam. But the Professor does not state whether the ratio has been exactly ascertained.

MECHANICAL PROGRESS.

An Improved Process of Casting Metals.

Recent experiments in England with the process of casting metals under continuous and considerable pressure, an American invention, have been so successful in producing perfect and clean castings as to win for this method hearty commendation from the British press. The processes may be briefly described as follows: The article to be reproduced is a finely cut medallion, with, say, a plain reverse. It is in the first place laid face upward upon a thick, smooth metal plate, fitted with certain stops to keep the medallion in position. The latter is then coated over with a creamy mixture of kaoline, or china clay, and the fine sand flour mixed with oil, the whole resembling in consistency very thick paint. This is laid on with a soft brush. The plate and medallion are then placed in the bottom of a flask of great strength made of iron or gun metal. The very finest description of moulding sand is sprinkled over the medallion, first by hand, and then the flask is filled up about water measure with the same. This being done, and the sand being well tamped around the sides with a wooden dolly, the flask is pushed beneath a frame, in appearance not unlike a huge letter-copying press.

The screw of this press is turned by two men moving a long iron cross handle, and a plate precisely fitting the interior of the flask is forced down on the sand, after the manner of making of the semi-plastic process. The flask is then withdrawn, and the sides opened, then the plate and the sand removed, and reversed upon a surface table, and the plate lifted off. The medallion is gently heated by a gas blow pipe; this expands it slightly, still further forcing its impression into the sand; then, on cooling down, it contracts, becomes loose, and is easily lifted out. The fine clay slip makes a beautiful smooth glossy surface lining to the mold. The mold is further hardened by baking, and at the time it is ready to receive the metal, it forms a most faithful impression of the object to be reproduced. Any description of mold can, of course, either single or in halves, and with or without core, as required. More than a single casting also may be comprised within one mold block, a separate "gate" being provided for each. The mold has one large orifice going quite through it from side to side, the side gate to the matrix opening from it.

A number of these molds being complete, they are ranged in order within a proper casting case and compressed by a screw; the holes of all the molds correspond and form a pipe or tube terminating at the point where the metal is to enter. The orifice in the casting case is fitted with a circular clay collared nozzle, which nozzle is fitted with a clay plug which fits it tightly. A horizontal iron cylinder communicates with this nozzle, and within the cylinder works a piston and rod, the rod passing out of the end of the cylinder most remote from the molds. In the upper side of the end of the cylinder farthest from the molds is a hole, surmounted by a hopper. As the molten metal would at once chill solid as a ring, where it encountered the cold metal of the cylinder, the latter is coated inside with a "fetting" of some refractory substance, which is applied with a brush while in a semi-fluid state.

The *modus operandi* of casting is thus described: The piston being drawn back, the molten metal is poured into the cylinder; the piston is then guyed forward, by means of power applied behind, to the piston rod. As the piston—which is simply a solid disc fitting the cylinder itself precisely—advances, it scrapes off the lining of the latter, and this latter curling inward effectually packs the piston and prevents the escape of the metal by leakage. For a time the clay plug in the nozzle resists the pressure of the iron urged on by the piston; it, however, is at last forced in, and the metal impelled on by the piston, is forced into the minutest cranny of the mold. A great and advantageous feature of the process is the total exclusion of the air during the passage of the iron into the molds. This, from the accuracy in making the moulds by the aid of machinery, and the subsequent forcing of the metal into them while the metal is fluid, gives as a result castings perfectly homogeneous and free from air blows; and the design of the matrix is reproduced on the metal so perfectly that no subsequent tool chasing is requisite, because the original itself, perhaps a perfect example of the chaser's art, is reproduced in perfect *fac-simile*. One great merit in the application of Mr. Smith's process of casting is that it involves no operations of a complex or difficult character. The work is of a nature so simple, and as a rule so light, that women, boys and girls can perform it quite as well as men, and at the same time it supplies a means of reproducing in infinite numbers all the gems of carving, modelling and chasing that are in existence, thus largely contributing to the promotion of a more beautiful taste throughout the world by bringing objects of real beauty within the reach of the most humble household. There is practically no limit as to the nature of the metal, for any metal, from cast-iron to gold, may be employed. —*Am. Manufacturer.*

INGENIOUS NEW BALANCE.—Prof. C. Pickering, of Boston, with whose name our readers are familiar, has patented an invention thus described: The object of this invention is to

produce, for the purposes of scientific investigation and the use of the public in general, an improved balance, which consists in arranging a spirit level and adjustable weights with one end of a scale beam carrying a weighing pan at its opposite end. All the weights, large and small, are put on the scale pan, which will then balance the weight of the beam, so that the bubble of the level will come to the center of the tube. If not, a loose nut is adjusted till the exact balance of the weight is obtained. The body to be weighed is then placed on the pan and the weights removed gradually until the bubble is again in the center. The weights removed are equal to the weight of the body. The weights may also be taken off and added in the usual way till the beam is again horizontal. Those remaining give the weight of the body. —*Gastlight Journal.*

A Copper-Clad Ship for Carrying Combustible Freight.

The importation of corrosive sublimate, vitriol and similar dangerous compounds, has heretofore been carried on to a small extent, says the Jersey City Journal, owing to the damages ensuing to the ships used in their transportation, as the leakage and draining from the different named substances, when mixed in the bilge water of the vessels, has in most instances eaten the bottoms out of the vessels.

A company in England running to the East Indies first thought of using copper in the construction of their vessels as a preventive against the bugs that infest that locality, the said bugs being considered death to all wooden vessels, and instances have been shown of the successful depredations of these insects even on iron-clad ships. To obviate these drawbacks to commerce, a ship was built completely encased in copper.

The frame-work is of iron, which, however, is not exposed in the least. The outside is covered with sheets of thick copper, riveted in the same manner as the iron vessels. The whole interior of the ship is also made of copper, the inside copper being galvanized, the beams, and, in fact, every exposed part being completely protected by copper, the masts are of wood, but sheathed in copper from top to stem. The name of this copper monster is the *Adirondack*; she is a screw-steamer, and is capable of carrying 7,000 tons, Custom House measurement, and is about 515 feet in length, being some seventy-five feet longer than any of the Oceanic Company's ships.

The White Star Line have purchased this steamship for the purpose of carrying such freight as mentioned. Her upper deck has been fitted up with a large tank for carrying oil of vitriol in bulk, lunar caustic, potash, sal soda, and in fact all similar kinds of freight will be imported in larger quantities now, should the trial trip succeed, which there is every prospect of its doing. The *Adirondack* is now being got ready for her trip, and will arrive in this port in the course of a fortnight. She is coated on her outside with a preparation of fat and copal varnish, to protect her from the effects of sea water, and it is said that the reflection of the ship upon the ocean on a bright sunny day is like the reflection of the sun at sunset on a large building containing many windows, only on a larger scale. It is claimed that she can be seen at sea on such days a distance of about seventeen miles.

LEATHER BOARD.—Fish glues, or gelatines, are used to a very limited extent in the manufacture of those universally-used accessories to the production of cheap boots and shoes, commonly known as paste soles and heels. Of course in this, as in the boot and shoe business, the busiest season has gone by, but many hands are still employed in the conversion of the various refuse discarded by the tanners and curriers, and known as "paste roundings, shoulder splits, and skivings," into heels and soles of all kinds of boots and shoes. These materials are cleaned, damped, cut by dies, pasted into moulds, compressed in a powerful press, and dried, and the refuse of this business in its turn is turned over to the manufacturer of what is known as "leather board." This smooth, hard, leather-lined material is largely used in the heels, inner soles, and for the inner stiffening of heels and box toes, and some twenty mills are engaged in its manufacture, turning out from one to five tons daily. About one-third of leather, with varying proportions of canvas, old rope, straw, and other "hard stock," is used in its composition. It is manufactured like straw board, which is itself extensively used, especially in cheap slippers and children's shoes, offered in any quantity to a discriminating public at ruinous prices. As many as eighty hands are kept busy in a single establishment in the manufacture of "paste heels," and the stamping of heels and soles from leather and straw board. —*Boston Commercial Bulletin.*

NICKEL PLATED SAFETY-VALVES.—Undoubtedly one of the causes of boiler explosions, is failure of the safety-valve to perform its function. This failure is sometimes caused by the rust which so rapidly accumulates under the influence of air and moisture. Not only do such valves sometimes rust fast to their seats, and thus refuse to open except under pressure far above that the weight alone would allow, but after having been opened are prevented by the rust from closing until the pressure has fallen considerably below that for which the weight is set. The idea of plating such valves with nickel, and thus preserving their surfaces always smooth and clean, is a happy one. —*Artisan.*

In the Lincoln mine the winze is now completed from the 200 to the 300-foot level, and a much better ventilation of the lower level of the mine is obtained. This winze was driven through a solid body of good paying rock, and no break was found in the vein throughout the whole distance.

OUR MINES.—*Ledger*, January 24th: We have but very little intelligence from the mines throughout the county for the past ten days and therefore have no new facts to communicate. Notwithstanding the heavy storms of the past ten days, our quartz mines and mills therewith connected, have kept steadily going without interruption. The Kennedy mine holds its former fine appearance, the ledge running south still being of unknown width and of equal quality as at last reports. In the Onida, the prospect we are informed is very flattering, while the mines at Sutter Creek, Amador and Plymouth, are rendering to their owners their usual monthly yield. We have heard no discouraging reports from any of the quartz mines in the county. On some of those only partially developed, work has been temporarily suspended, but on all such, will be resumed in the spring. On the Valparaiso at Fiddletown, the last work done showed a good ledge of excellent rock, and the prospect of this mine being developed into a rich paying one is very flattering. Work will be resumed upon it in the spring and pushed on with vigor until proven. On the Casco, work is now progressing, but with what success we have not been informed. This mine however, is located on the great mother lode, and in the end, will prove a success.

Placer mining to a limited extent, is going on in different parts of the county, but to a greater extent at Fiddletown and Volcano than at any other localities, and we are pleased to learn, our placer mines are doing well generally. The tunnel at Volcano is progressing finely, and work thereon is steadily going on; a further contract of 100 feet was let a few days ago; the rock is represented as being very soft and that rapid progress in driving the tunnel can be made. The weather for the past ten days has been very unfavorable for mining generally, but the heavy rains and snows higher up in the mountains, will furnish abundance of water to supply our ditches and canals. The prospect is very favorable for extensive placer mining in the spring, particularly along the line of the Amador Canal, which we are informed will reach completion by the first of April next.

BUTTE COUNTY.

KILLED BY A CAVE.—*Record*, Jan. 24: On Monday evening a man was killed in the Spring Valley Company's claim at Cherokee, by a cave. He was a young man 24 years of age, named John Pinkston, formerly of Yankee hill.

FLOOD DOWN.—The storms of last week damaged the main ditch of the Feather River and Ophir Water Company, by raising such a flood in Woodman's ravine, above Bidwell bar, as to wash out the flume spanning the ravine. The damage was not very extensive, and was repaired in 8 or 10 days.

CALAVERAS COUNTY.

SAN BAUNO.—*Chronicle*, Jan. 24: We have seen some specimens of quartz taken from the San Bruno mine at Mosquito, that show rich in free gold. We were shown rock taken from both the upper and lower tunnels, all of which would prospect largely. In the lower tunnel the ledge is fully two feet wide. A distance of about twenty-six feet has been run on the vein since the pay chute was struck. In the upper works a shaft has been sunk to the depth of twenty-four feet below the level of the tunnel. Rock previously taken from that point in the mine—work having to be stopped on account of water—paid \$70 per ton. Running the lower tunnel has drained the upper work sufficiently to permit the resumption of operations.

WOLVERINE.—The work of running levels, north and south, in the Wolverine mine near Railroad flat, is progressing rapidly. The south level is already in a distance of sixty-five feet from the shaft, and probably ere this the middle chimney has been tapped by it. The north level has been run but a short distance, work having been only recently commenced in that direction. The levels are at the depth of 400 feet.

VEITH & CO.—Work in the hydraulic claim of Veith & Co. is steadily prosecuted with favorable results. The late storm was not permitted to interrupt operations in the least, washing being continued as though "nothing had happened."

GOON ROCK.—Splendid rock still continues to be taken from the Good Hope and Monte Christo mines at Mosquito. We learn that, rich as the latest crushings from these mines have been, the quality of rock now being taken out promises even larger yields than ever.

SHUT DOWN.—Garland's mill at Mosquito has been compelled to shut down, the snow being so deep that rock cannot be handled from the mines. The suspension of operations will only be temporary, however.

COLUSA COUNTY.

OUR QUICKSILVER MINES.—*Sun*, January 24: At the Excelsior mine a retort had just been put up and five tanks of quicksilver taken out, when the snow and rain storm came and caved the tunnel in so that they cannot work to advantage. They know they have a good thing to start in on in the spring. The Abbott mine is turning out quite a lot of quicksilver—so is the Buckeye. Mr. Chapin prophesies that within the year half the trade of Colusa will be coming from these mines.

EL DORADO COUNTY.

DEMOCRAT, Jan. 24: Last week 56 tons of rock from the "Rose"—Brewster & Sheperd's new mine, in this city,—was milled, and 320 ounces of amalgam was cleared up. At \$7.50 per ounce, which is a low estimate, this will yield \$2,400, which is pretty good considering that it was done within 40 days from the time the first pick was struck upon the ledge. Mr. Shepherd thinks that four to five hundred dollars can yet be cleared up from the tailings, and that when the entire clean up is refined it will not fall below \$3,000. The expense of this production, including the grading of a good road to the mill, about a quarter of a mile, did not exceed \$600. This ledge has been crossed daily for the past 15 or 20 years; prospecting has been done all around it, and it is only a few rods from the "Pacific" ledge, out of which millions have been taken, but its richness has been reserved for the present lucky owners. It is not improbable that there are hundreds of ledges equally as rich in the county, that will eventually be stumbled upon, and the discovery of this ledge will undoubtedly hasten the unearthing of some of them.

The work of sinking the "Ida Mitchell" ledge is progressing slowly, the rock being flint-like in hardness, but fully maintains its previous richness.

KERN COUNTY.

PROSPECTING.—*Miner*, Jan. 24: Since the last rain prospecting throughout the county has been carried on pretty generally. We anticipate hearing of some big discoveries before long, if pleasant weather continues.

MARIPOSA COUNTY.

WASHINGTON MINE.—*Gazette*, January 23d: A rumor comes from Hornitos that rich rock is being taken out of the shaft in the Washington mine that the company have been engaged in sinking for some time. That they are taking out paying quartz is said to be beyond a doubt. It is gratifying to the owners to have a prospect of being remunerated for their outlay, while Hornitos will share in the benefits of the discovery.

HITE'S MINE.—The mine at Hite's Cove, owned by John R. Hite & Co., is paying steadily this winter, and shows no sign of letting up.

NEVADA COUNTY.

WYOMING MINE.—*Transcript*, Jan. 23: The Wyoming mine has been known to the people of Nevada City and county for many, many years, it having been located in the year 1851. Since active operations were commenced in the mine, it at various times yielded an immense amount of ore to its owners. An incline has been sunk a distance of 60 feet on a fine ledge of gold-bearing quartz, which averages two feet in width. Last October the value of the mine was vastly increased by the purchase of an adjoining mine, known as the Ural or Richard's mine, which runs parallel with the Wyoming, and has been heretofore worked through a tunnel running on the ledge 1,300 feet in length. From the face of this tunnel a cross-cut is being run to cut or to intersect the Wyoming ledge. This accomplished, the Wyoming will furnish an ore supply to an unlimited extent. At the mouth of this tunnel is a mill, purchased from the Ural Company, which has recently been put in first-rate condition by the Wyoming Company, and which is now crushing ore obtained from an intermediate mine, and which is yielding good pay. Free water supplies the power for running the mill, and can be had in abundance the whole year round. We learn that it is the intention of the company to run their tunnels to intersect an incline to be sunk next spring. When this intersection occurs, the mine will then be opened over 1,000 feet in length and to a depth of between 400 and 500 feet. The Wyoming certainly possesses facilities for taking out and crushing a large quantity of ore at a cheaper rate than can be worked by any other mine in this State, and with its past record for richness while worked in a crude way, and the present facilities for work, we think it can safely be said that it will in the future prove to be one of the best mines in this county.

IDAHO.—*Tidings*, Jan. 23: To-day the regular monthly clean-up at this mine takes place; too late for report in this issue. It will be given in full next week. The main shaft is now nearly to the 800-ft. level. When that is reached, the section between the 700 and 800-ft. levels will be enlarged and timbered; after which, drifts will be started from the bottom. The ledge at all working points is looking well.

MCCOOK BROTHERS, the owners of a promising mine near Deadman's Flat, are erecting new buildings on their claim. Work is suspended for the time, but will be resumed on the completion of the buildings. The rock from this mine is said to have never yielded less than \$80 per ton.

EUREKA.—At this mine the work is progressing as usual. They are still sinking on the main shaft and are now at a depth of 1,100 ft. Also prospecting on the 5th level at the west.

PLACER COUNTY.

OUR MINES.—*Herald*, January 24th: We heard it expressed by a competent quartz miner a few days ago, that in his opinion this is the best quartz district in the State. He thought all that we need is a few enterprising men who have capital and are not afraid to invest it. He went on to reason thus: "Let a man go to work with one or two thousand dollars, and nine times in ten his money is all gone before he gets any considerable returns, and he finally gives up in discouragement; while on the other hand let the right man take hold of most any of these mines, (for he thought they

were most all good) with capital to back him and determination to go to the bottom whether he makes or breaks, and nine times in ten he would come out successful." This theory seems very plausible, from the fact that, in every instance yet where the work has been prosecuted with determination, success has crowned the efforts of the faithful. The St. Patrick company of all others have worked most systematically and spent most money, and undoubtedly have got their reward.

THE OULEANS MINE.—This mine, which is located about a mile and a half or two miles west of Auburn, has recently been bonded by T. H. Gordon of this place, who has commenced work on it. They have a ledge about three feet thick of excellent looking rock. There has never been much noise made about this mine, but we have seen specimens from it which, to use the miner's expression, were "lousy" with gold; and we have heard it whispered around that this mine has the finest prospective value of any in the district, the St. Patrick included. An expert from San Francisco recently estimated the rock now on the dump as high as \$700 per ton; a large portion of which he said would go off in the sulphurets; showing the urgent necessity of erecting chlorination works in this quartz district.

MINING.—We learn from parties from the upper part of the county, that they now have plenty of water, and that miners are busily at work. We have had an unusually hard winter thus far, and the indications are favorable for an abundance of water until late in the season. This is the element that insures prosperity to miners, and gives renewed life to Placer, in common with other mining counties.

PLUMAS COUNTY.

STARTED.—*National*, Jan. 17: The showers of the past few days have started the water through the ditches, and the hydraulic companies will soon be in full blast. The creeks are full to overflowing and a few days more rain would result in a small sized flood.

QUARTZ.—We hear that the Indian Valley Co. have struck a rich streak of quartz in their ledge and the mill is paying better than it has for several months past.

SIERRA COUNTY.

TOO LOW.—*Messenger*, Jan. 24: The tunnel run under Oak Flat, at Cooper's Ranch, is in to gravel, which prospects well, but unfortunately the tunnel is too high. When work was commenced almost everybody who knew anything about the country was sure they had started too low. The company is abundantly able and will thoroughly prospect the flat.

TRINITY COUNTY.

JUNCTION CITY.—*Journal*, Jan. 24: From Mr. Jas. M. Pickett we learn that miners in the vicinity of Junction City are all at work, and with better prospects than ever before. As at all other points in the county, the miners there better prepared for work than heretofore, and there is none of them but what are working paying ground. When "clean-up" time comes we expect a good report from Junction.

TUOLUMNE COUNTY.

FIND.—*Independent*, Jan. 24: A short time since, a squaw found two pieces of quartz gold, one worth at least \$96, the other over \$100. She refused to tell the exact locality, but said the place was at or near Shaw's Flat. She tried to "hear" the grasshopper market, but did not succeed, as the bucks were all interested in raising the stock.

The Sonora Inspector of Babcocks found, on his beat, a piece of gold valued at \$1,12½. This was on Tuesday last, on Lahatone street, back of the City Hotel. Every year gold is found at this point, and several pieces have been picked up there this winter previous to the above find.

Washing is being vigorously carried on in the old Craig claim, Sullivan's Dry Arroyo. The prospect there is reported to be good for a generous yield.

GONE TO WORK.—The miners that quit work at Blue Gravel Mining claim in Table Mountain last week, in consequence of the owners requiring ten hours for a day's work, went to work again on Monday, and are now working ten hours. Everything is progressing and active on the claim.

KINCAID FLAT MINING COMPANY.—*Democrat*, Jan. 24: This claim, is the only placer claim in the county that is worked continually, without interruption night and day, for every hour in the twenty-four, regardless of rain, snow or cold, that we have any knowledge of. Huge banks of earth are being brought to low levels, and not infrequently the eye is treated to the sight of a chispa.

CHISPA.—One day last week, a boy found a lump of gold-quartz in the Columbia and Gold Spring road, beyond the reservoir, valued at \$22. A wagon wheel had passed over it, which brought the glitter to the piece, and afterwards to the boy's eyes.

SALE.—M. C. Duchow and C. F. Tobey have sold their gravel claim, in the reservoir, adjoining Captain Eakin's, Columbia, to a company of Chinamen for \$300 cash.

The Sonora Foundry has completed two self-feeders for the Shawmut quartz mill. This is a new invention by Mr. James Tulloch, of Jamestown.

Mose Lewis has shipped from Oakdale 75 tons of iron ore from the mine near Jamestown, and has now on hand for shipment, over 120 tons more.

The first clean up was had at the Alpha T. M. Gravel mine, on Friday last, and the result was equal to a reasonable desire. The breast of gravel is widening and improving. A force of ten hands is at present employed, and more will be added as room is made for them to

work. The company will soon put up two mills.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill News, Jan. 24: Sinking the main shaft for the 1,400-ft. level is making steady progress: The main drift on the 1,000-ft. level has made connection with the np-ralse from the 1,200-ft. level, giving a fine circulation of air. The main drift on this level is being continued directly ahead, to cross-cut, prospect and ascertain the width of the ore vein at that point. The north drift on the 1,300-ft. level is in 33 ft., and is intended to penetrate and prospect the ground of the California Consolidated, and eventually to make a connection with the main south drift from the Ophir on the same level. No ore has been extracted from the mine on account of the ore dumps being full and the weather so stormy that it was impossible to get the ore hauled to the mills.

OPHIA.—A south winze from the 1,300-ft. level has just been started to prospect the ore body and connect with the main south drift on the 1,465-ft. level. Another winze has also been started to prospect the ore body extending downward from the 1,465-ft. level. In opening the station for this winze, a space of 15 ft. was cut in a solid body of rich ore.

HALE & NORCROSS.—Daily yield 40 tons of ore, mostly from the second, third and eleventh station levels. The east cross-cut at the 1,900-ft. station has penetrated to the east wall of the ledge. The west cross-cut from the same station has passed through a small vein of ore 12 inches thick that assays from \$8 to \$45 per ton. This ore vein lies within four or five ft. of the west wall, and although of not much importance as yet may possibly lead to a more permanent body.

SIERRA NEVADA.—The repairs to the engine are completed and the mill running to its full working capacity on ore from the mine.

ALPHA.—The main drift on the 1,500-ft. level from the Imperial shaft is making steady progress, following the line of the ledge, the face still in quartz that promises an ore development at almost any moment.

AMERICAN FLAT.—The main southwest drift, on the 500-ft. level, has been extended a distance of 200 ft. south of the Baltimore line, running nearly parallel with the ledge and some distance from it. For a distance of 175 ft., at convenient intervals of from 15 to 30 ft., crosscuts have been run to the ore body and then stopped, exposing small patches or spots of ore that show exceedingly well, samples of which will assay from \$50 to \$4,000 per ton. Just how thick, or of what extent this ore body is, has not yet been determined. The fact, however, has been fully demonstrated that the American Flat not only has ore, but some exceedingly rich; but just how much of it, must as yet be determined by further prospecting.

CROWN POINT.—The extraction of ore has been greatly interfered with during the past week, on account of the ore dumps being full and it being impossible to get the ore shipped to the mills. The railroad being unable to ship the usual amount of ore, all the teams that could be procured have been set to work hauling the ore to the mills. The Sapphire mill was started up on ore from this mine during the week.

GOULD & CURRY.—The east drift on the 1,600-foot level, after being run a distance of 585 feet through the ledge matter, has reached the east wall, and been discontinued for the present.

SITRO.—The work of sinking the winze is progressing slowly, owing to the fact that a large body of water has been encountered. The ore body appears to widen as the work of sinking the winze progresses.

SAYAOE.—The main east drift on the 1,600-foot level has been discontinued for the present. The main southwest from the 1,900-foot station is being rapidly driven ahead, the rock in the face being much softer. Sinking the south winze from the 1,700-foot level, near the south line, to connect with the main drift south on the 1,900-foot level, is making steady progress.

JULIA.—Driving the main southwest drift at the 1,000-foot level is making steady headway, the face in ore of a fine quality. The main southwest drift on the 900-foot level is still being driven vigorously ahead, parallel with the ledge with excellent indications of soon striking a continuation of the ore body found on the level below.

LEO.—Sinking at the bottom of the incline was resumed last Tuesday, since which time fair progress has been made.

BLOHEM.—Daily yield 550 tons of ore, which is extracted from the 1,000, 1,200 and 1,300-foot levels. The main incline is down 73 feet below the 1,400-foot level and is in hard ground. The drift running easterly on the 1,400-foot level is in 40 feet. The winze starting from the 1,300-foot level is down 70 feet. The mine is looking well in every part and is yielding an increased amount of ore.

YELLOW JACKET.—Sinking the main incline is being pushed ahead vigorously. The incline is down 80 feet below the 1,500-foot level. Considerable water has been encountered. Prospecting is still going on in the 1,400 and 1,500-foot levels. On Monday last a connection was made with the Crown Point mine on the 1,500-foot level.

SOUTH COMSTOCK.—The ledge is about 30 feet wide, dipping east about 40 degrees, and the shaft will be sunk perpendicularly through it to the foot wall, after which it will be fol-

"Foreign" Mines and English Owners.

The London Mining World has been writing a "Mining Retrospect" and after speaking of home affairs it thus pitches into American and other foreign mines:

The years 1872 and 1873 will always be remembered for the heavy losses incurred in the principal foreign gold and silver mines. There is a peculiar fascination about gold mining, which it appears nothing can weaken. Since the days when the Real del Monte flourished there have been excessive gold fevers, at first recurring at intervals of about ten years, but afterwards more frequently, until we have arrived at the present age of apparently chronic insanity. It would have been thought that the lamentable failures of Tanguaril and Eclipse, both brought out under the most favorable circumstances, and put to high premiums only to rapidly descend to the slough of liquidation, should have warned the public to use the utmost discretion—huh, no, the Utah Gold and Silver Mining Company, Limited, was introduced with a most influential board of directors. Specimens were sent over which the assays proved to be nearly all bullion; the £10 shares speedily went to £12 premium, and each shareholder congratulated himself upon having at last found the "little pea." But, alas! the fall was almost as rapid as the rise. Shares were bought to average, but yet the cry was "still they come," and quotations ruled at heavy discounts. To revive confidence several gentlemen were sent to personally inspect the property, who were unanimous in their glowing accounts of its inexhaustible riches. At last the inevitable general meeting was held, when the shareholders had the satisfaction of learning from the chairman and directors that the wonderfully rich ore had changed to ore of a low grade, in fact, not superior for bullion to some of our neglected home mines; that the company was heavily in debt, and that unless money was raised to discharge existing liabilities the mines would be seized by the creditors. Ill-natured persons—of course hears—stated that the furnaces were erected in the wrong place, and that ore of low grade could not be made to pay when the manager received such a high salary, and the cost of labor, carriage, and materials was so very heavy. Yet the shareholders have responded, and some who gave upwards of £20 per share would now be glad to realize for about as many shillings.

The Mineral Hill, brought out with a capital of £400,000, and the only foreign company advocated by the Times, was another rapid and disastrous failure. These warnings were, however, unheeded, and the 'cute Americans, taking advantage of the cupidity and credulity of our capitalists, succeeded in effecting some brilliant and most valuable coups. A mine was obtained having some rich ore, which was carefully worked for future dividends. It was sold to English promoters at an enormous price, who formed a company and placed it on the home market at a profit of 100 to 200 per cent. The hoards of direction were formed of gentlemen apparently above price, and yet many of the shareholders must have wondered that even with ordinary business capacity such glaring delinquencies could have been overlooked. A new system of monthly dividends was established, which, while it lasted, found great favor with the public; but, as a rule, they only continued long enough to enable the promoters to get rid of their shares. No sooner was a company started than the shares were put to a high premium, and it only requires a glance at present quotations to see the immense sums of money which have been hopelessly sunk in foreign mines to the great prejudice of our legitimate home adventures, which have in consequence been sadly neglected. The history of the celebrated Emma mine will be handed down to posterity in the category of popular delusions. The correspondence among parties interested has been most voluminous, and we can now arrive at a fair opinion upon the trickery and finessing practised both in America and this country. The principal features may be summed up very shortly: Purchased by the English promoters at a price many times beyond its value, a company was formed with a capital of £1,200,000, and the market value speedily worked up to nearly £2,000,000; dividends were paid amounting to £216,000, and the promoters realized immense profits, and the credulous public hold the shares which at present do not pay any interest. Leaving out Oboutales, Quebrada, Javali, Tanguaril, Eclipse, Great Western and Mineral Hill, which entailed a loss of upwards of £1,225,000, we subjoin a short list, which will give an idea of the losses which have recently been incurred:

MINE.	Capital.	Highest Selling Price.	Present Price.
Camp Floyd.....	£120,000	£204,000	nil.
Eberhardt.....	235,000	987,000	99,875
Emma.....	1,200,000	1,980,000	187,500
Flagstaff.....	300,000	610,000	120,000
Gold Run.....	30,000	33,750	6,000
Last Chance.....	100,000	160,000	40,000
New Pacific.....	105,000	105,000	3,750
Newfoundland.....	100,000	115,000	60,000
Rica.....	60,000	60,000	33,750
South Aurora.....	300,000	900,000	30,000
Tecoma.....	300,000	316,000	60,000
Utah.....	100,000	220,000	17,500
	£2,940,000	£5,579,750	£658,375
	£2,281,625	£4,921,375	

This list does not include Tolima, Crescent, East Sheboygan, I X L, Kansas, Malaga, Ruby Consolidated, San Pedro, Santa Barbara, Saturn, or Snowdrift, which have either collapsed or are only mentioned on the market in terms

of derision. Inventors have paid dearly for their experience; but the lesson will not be without benefit, if it only inculcates generally principles of prudence and foresight. With money easy, and an expected revival of trade and commerce in the new year, there are doubtless many specious schemes ready to be launched, which it will be well for the public to regard with suspicion. Let high premiums in newly constituted companies be shunned, as they almost invariably resolve themselves into heavy discounts.

History of the Schenectady Mine.

The Alpine Miner has been giving a series of exhaustive articles on the mining interests of Alpine county, Cal., from one of which we extract the following concerning the Schenectady mine in Monitor district. This mine, better as the Tarshish, was considered one of the great mines of the coast, but unfortunately it has not maintained that reputation by its merit in producing bullion. This is an Eastern organization, the majority of the shareholders being residents of Schenectady, N. Y., where the office of the company is located. The work of developing this property commenced in the fall of 1866, by contract to John P. Ray for the making of 600 feet of tunnel. The work was vigorously pushed, and the contract completed early in the spring of 1867. The last blasts in finishing up the contract broke through the porphyry which constitutes the east wall of the ledge, into a soft, white, putty-like substance, apparently worthless. Mr. Ray took a quantity of this kaolin matter on a shovel and "panned it out," in miners' parlance, whereupon he discovered a large percentage of black sulphurets, which, upon assay, proved immensely rich. This soft ore, in its natural state, assayed as high as \$500 the ton. A lode of this ore was immediately taken to Dall's mill, in Washoe valley, where it was worked by the Frieberg process, yielding \$400 per ton. This so encouraged the company that they immediately sold their "reserved stock," amounting to 20,000 shares, thereby raising a fund of \$40,000, with which to prosecute the work of opening the mine. A German by the name of Graff was put in charge of the works, which were pushed vigorously until the early part of the following winter, when his funds were exhausted, and not sufficient returns available from the mine to pay current expenses, and the mine closed down. There were two workings of the ore during Graff's administration, that demonstrated that it could be worked profitably provided there was enough of it. After remaining closed for a year or so, a new superintendent arrived on the ground, hailing from the home office, and being a no less person than one of the Board of Trustees of the company.

Mr. Schwerin, the new Superintendent, was sent out, not on account of his ability and skill either as a miner, mineralogist or metallurgist, but for his superior ability as a financier. This latter quality seems to have outweighed all practical prerequisites in the minds of the board of management, and the results at the mine clearly demonstrate their wisdom. Mr. Schwerin had charge at the mine for three years, during which time he extracted and sold about \$10,000 worth of ore, besides having a large amount of prospecting done, which demonstrated, in his opinion, the necessity of a mill to fully prove the value of the mine. During the entire administration of Mr. Schwerin we are told that he never once went into the mine, being of so nervous a temperament that his organization, courage, or something, would not permit of so daring a venture. However, that was nothing. Did he not have one of the ablest foremen on the coast, if not in the world? and did he not have reports, etc. etc. from a celebrated mineralogist and metallurgist? and was not the concurrent testimony of both these gentlemen to the effect that there was a body of ore in eight sufficient to keep a twenty-stamp mill running three years, that would pay thirty dollars a ton? Was there not also on the dump ore to the value of two hundred thousand dollars—enough twice told to build a first-class mill? A little calculation here is necessary to see what profit the company might expect to derive from this stage of their mine. Inasmuch as the ore had to be roasted, therefore crushed dry, the average workings of twenty stamps would not reach above 20 tons in 24 hours, which, for 300 working days would be 6,000 tons, and for three years 18,000 tons. This, at \$30 the ton, would be \$540,000, one-half of which should be net profit, which would give \$270,000, or nine per cent. interest on the full capital of the company of one million. In consideration of the fact that this stock had not, nor would with the cost of the mill added, stand the owners in above twenty-five per cent. of its par value, the nine per cent. would in reality be thirty-six per cent. on the cash outlay.

This was a grand showing, and the result was a magnificent mill of twenty stamps capacity, costing somewhere in the neighborhood of \$100,000. The mill was completed early in 1872, and just at this juncture, when all the experience and ability of Mr. Schwerin was needed to pilot the enterprise into the port of success, his health failed him, and he returned home. The vacancy was fortunately filled by the appointment of a first-class surveyor and architect, whose integrity was above suspicion,

if his mining experience was not. This splendid mill was started up, when the first thing proven was that the "White" roasting furnace, which had been adopted by the Superintendent over the Stetefeldt on account of economy, was a total failure; therefore the ores would not amalgamate for lack of chlorination. What was to be done now, and in what direction should the new Superintendent look for relief? His head amalgamator said "in wet crushing and raw amalgamation." The mill is soon converted into a wet crusher, and raw amalgamation "goes." What is the result? One hundred tons of the best average ore of the mine is run through the mill and down the creek, with no residuum in form of bullion to act as a reminder of the experiment. Result, suspension, and return home of Superintendent No. 2.

These, in brief, are the facts in the history of the Tarshish company. We now come to the merit of the mine, and the question naturally arises in the mind of the reader as to whether it has any or not. We most emphatically answer, yes. The great trouble has been in the appointment of men to the management of the mine who had no experience whatever in the business, and as in the case of Mr. Schwerin, one who did know the daily condition of the mine by personal examination, being thus left to the tender mercies of his foreman and such experts as he chose to employ. In all the vast and reckless operations in mining in California, we doubt if there is a parallel case—where the Superintendent never visited the workings of the mine. The second Superintendent is in no way responsible for the final outcome of the enterprise, for the whole thing was so blocked out that he was comparatively helpless.

During the past summer and fall Mr. B. E. Hunter, at present in charge of the mine, has been quietly experimenting in working the refuse or waste rock of the old dump, with a most gratifying result. In his first run of something like a week, where he expected a return of four hundred dollars, he got nine hundred; and in a subsequent run of like duration he got somewhere about thirteen hundred, showing that a familiarity in treating the ore increased the returns. Another run of a month gave a return quite as satisfactory as either of the foregoing. The reduction was by wet crushing and raw amalgamation.

Now, when we consider that these returns have all been from rock thrown upon the waste dump by Messrs. Graff and Schwerin, in their explorations in the mine, what might we not reasonably expect when the ore is mined and milled?

We are satisfied that this mine can be worked at a profit to the Company. We know of parties who would be glad to lease the mine, giving the company ten per cent. of the gross yield, and hiding themselves to secure the company against all debts incurred in the working.

We believe the proper way to work the ore would be to crush wet, run the pulp over long sluices, and thus concentrate the ore, say ten tons into one, bringing the average up to from \$100 to \$150, and then roast in a reverberatory or Stetefeldt furnace, by which process from 90 to 95 per cent. of its value could be saved. By such a method of treatment the mill could be far more economically run, and a lower grade of ore than otherwise could be treated. One great saving would be in quicksilver, which, by the most careful management in amalgamating, wastes not less than one pound on the ton of ore treated. By concentrating one hundred tons into ten we would save 90 pounds of quicksilver, which at present prices—\$1.30 per pound—would amount to \$117, certainly a very large item for two and a half days' run. The company's mill is capable of crushing 40 tons in the 24 hours, and could be run at an expense outside of the amalgamating department, not exceeding one dollar and a half to the ton on the amount of ore crushed. At this rate a very low grade ore could be worked at a profit. We confidently look for something of this kind being done at no distant day. It is certainly to the interest of the company to do something with their extensive and expensive property, to get even a small annual percentage on their outlay, for it is a well known fact that no species of property deteriorates more rapidly by idleness than does mining and milling. In the mine, timbers rapidly decay and caves occur, that become more expensive to repair the longer they stand, and the mill rusts and rots out by idleness quicker than it would wear out by every-day use.

HYDRAULIC RAM FOR RAISING WATER.—The following rule may be found useful for calculating the power of a hydraulic ram. Theoretically, the number of gallons per minute delivered would equal the number of gallons per minute passed through the ram, multiplied by the height in feet of the available head, and divided by the height in feet of the point at which it is required to deliver. The actual performance of a well-proportioned ram when new and in perfect order should be about 60 per cent. of this quantity; but for an average can hardly be reckoned at more than 50 per cent. If the water is liable to be dirty at times, it should be passed through a filter before going through the ram. With clean water, the pulse valve required renewal or refacing after about twelve months' constant work, and the brass "ball check" to "rising main" after about six months; but this would vary with the size and the height to which the water was thrown. In my case the height was 109 feet.—Field.

Utility of Flumes.

The Truckee Republican of the 3d instant has the following interesting article on flumes:

The utility of flumes for floating lumber, wood, shingle, lath, and mining timbers, has been practically demonstrated in this section within the past three years. Without them the wood and lumber business here would be, to a great extent, suspended; or carried on at a disadvantage. Without them mills built three or more miles from the railroad could not compete with mills built near the road, and obtaining their logs by means of the Truckee or its tributaries. But, by means of flumes, mills built at any distance from the railroad can compete successfully with those on the line thereof.

The amount of freight, of the description above alluded to, which one of these small and apparently insignificant flumes can carry is astonishing. A 20-inch V flume, with a uniform grade and a three-mile current, can deliver at its mouth, or at any given point, 10,000 feet of lumber per hour, or wood, lath, shingles or mining timbers in proportion. A flume ten miles long can deliver just as much freight as a flume one-tenth as long—its capacity not being gauged by its length. Flume property is the best and most productive of any property in this section. A few years ago lumbermen were at their wit's ends to find ways and means to get lumber to the railroad. Branch railroads, running back into the mountains where the timber had escaped the woodman's ax, were talked of and considered an ultimate necessity. Fluming experience has solved the problem as to the cheapest way to get lumber and timber to the railroad.

A mill built 20 miles away from Truckee, in the most inaccessible part of the Sierras, enjoys just as good facilities as a mill built in town if it has a flume connection with the railroad. It takes money to build one, but once furnished them with one-half the freight they can carry, and they will pay. It is a matter of surprise to us that the people of Grass Valley and Nevada city do not have their wood and lumber brought down to them in flumes. There is an abundance of timber five or six miles above Nevada city, easy of access, if a flume were used; yet by the old fashioned way of teaming wood is high there, costing from four to eight dollars per cord. The principal expense consists in hauling, the timber in the tree not being worth over fifty cents a cord, if it is that much. It costs from two to three dollars a cord to haul—say oak wood—a distance of five miles. A 20-inch flume with proper grade and from 40 to 75 inches of water, could deliver the same wood at 25 cents a cord.

But suppose a few of the enterprising men at Nevada city should build a flume such as we have suggested, and charge a toll of one dollar a cord for all the wood sent down, they would have a complete monopoly of the business and the result would be that the people of that town of 3,000 inhabitants would get their supply of fuel at least one-third less than they do now. It may be that our Nevada friends would be opposed to such an enterprise on the score of its resulting in a monopoly—a thing they detest. But as nearly every man and family in the town would be benefited by such an arrangement, they might for once be induced to let self-interest control their prejudice and rigid adherence to "principle."

Corporation Mining.

The Nevada Transcript says: In 1853, the great business of mining was almost wholly confined to individual effort, as at that time our rich gulches, ravines, and coyote diggings were paying the individual owners of small 30 and 40-foot claims a rich harvest. Now all that is changed, and mining is carried out by companies, who own and hold almost all the mining interests of the county, both gravel and quartz. It would now be a difficult thing to find a score of the old-fashioned mining claims of 30 square feet in the county. The result is, capital and combinations control all the mining interests and the laborer who does the work must depend on his daily wages for a livelihood. Then, scores and scores of the owners and workers of the small 30-foot claims were making small fortunes, and returning to the States to enjoy, with their families, the fruits of their labors—now but few return to take up their residence in their old homes east, and but fewer fortunes are made, except by those who control the capital of the country. Then, there was no stability to the proprietors; all, or nearly all, intending to return east, having come here with that intention, only intending to remain here long enough to secure a small competency; now, but few think or talk of returning, except to visit old friends and relatives.

The South Yuba Canal company, of this city, are now, and for some time past have been engaged in the construction of a dam, for reservoir purposes, at or near the site of the old Magenta flume, at Fordyce Valley, which, when completed, will hold more than one million inches of water, and supply that delectable article during the summer or fall months, when water is in the greatest demand. The breastwork of this reservoir is being constructed of solid masonry, and, when completed, will be fifty feet high and one hundred and fifty feet long. The area of land which will be covered with water, when the reservoir is full, is computed at 700 acres. The company have already expended upwards of \$20,000 on this work, and before it is completed, anticipate expending more than double that amount more.

USEFUL INFORMATION.

Taking Impressions of Leaves.

Rub vermilion, ultramarine, chrome green, or their equivalents well up with castor-oil to a thick paste or kind of printing ink, then take thin strong paper and cover it very thinly with the paint thus obtained, by means of a stiff brush. It is well to do this on a warm stone slab, so as to be able to put the paint on thin enough; then put the back of the leaf of which you wish to take the impression on this paper, put another paper over it, and rub down. This causes the paint to adhere to the projecting parts of the leaves; place the leaf thus prepared with paint on the clean sheet of paper on which you wish to make the impression, place another clean paper over it, rub down, and you will be surprised how the markings of the leaves will be printed in detail. Lace does not take the printing-ink so well, and would besides be spoiled by it; but you can make an impression of it by placing it between two sheets of thin, smooth, and strong paper; place this on top of the sheet prepared with the color as described, and this again on the sheet to be printed upon. Then you may by rubbing down form a good impression on the lace, on the principle of this multiple writer. If your prepared paper dirties the clean paper on which it lays, you have too much color on it, which you must remove by laying several times on it a clean sheet of paper, and rub. Observe that the operation requires a hard smooth table, or better, a stone slab, in order to obtain fine impressions. The above inks are indelible on paper. To make it indelible on cloth, which may be washed, rub some nitrate of silver in the black ink. If you want it to dry quick, you may mix some linseed oil with your castor oil, but then your prepared paper will not last so long, as this retains its efficacy only as long as the paint is not dried up.—*Manufacturer and Builder.*

How to PAVE STREETS.—In Manchester, England, there is a street, subjected to heavier travel than any Philadelphia thoroughfare, that has not been repaved or repaired for twenty years, and yet it is in better condition than most of our newly paved streets. The process by which such good paving is secured has not been patented, and is, in fact, no more of a novelty than the process of laying foundations for a building. Although the streets of Manchester are not subjected to the sudden changes of temperature by which in this city the road bed is expanded and contracted until well-laid surface stones are thrown from their position, yet before this Manchester street was paved the natural earth was dug away to a depth of two feet. Upon this bottom, which was considered below the penetrating power of frost, a layer of small stones, and on that successive layers of stones, of different sizes, from that of a man's head to the size of a walnut, were spread and carefully compacted together. Upon this macadamized roadway oblong granite blocks were laid, with small interstices between each stone, into which small gravelstones were put and well rammed down. The whole street was then covered with asphaltum, making it as nearly as possible waterproof. Any water which should get below the surface or rise from below would find a course between the larger stones of the foundation. The first cost of preparing such a roadway would be proportionally heavy, but would in the end be much less than the cost of relaying the pavement every year or two, to say nothing of the inconvenience arising from the tearing up of roadways at frequent intervals.—*Public Ledger.*

PURIFICATION OF TALLOW AND LARD.—Dr. Dotch states that tallow and lard may be kept from getting rancid by the following process: The tallow or lard is first treated with carbonate of soda in the proportion of 2 pounds of soda to every 1,000 pounds of lard, and is then subjected to a digestion with alum in the following manner: 10 pounds of alum are dissolved in 500 pounds of water, and 1 pound elaked lime added to the solution and boiled. This solution is stirred well with 1,000 pounds of lard at a temperature of 150° or 200° Fah. for about half an hour. The liquor is then separated from the lard, and the lard is treated with the same amount of pure water again. This lard will keep for an exceedingly long time. The fact is that the alumina in the alum applied acts very readily in a disinfecting manner upon those compounds which are liable to give rise to rancidity. The lime is added to the alum in order to render the alumina more active by its giving up some of the acid to the lime. This treatment has also the advantages of restoring the original flavor and of producing a lard of a greater whiteness.

A NEW DESTROYER FOR THE HAIR.—Under the above title Dr. Boettger says that we possess a new material for destruction of hair, of a most suitable description, in a mixture of one part of crystallized sulphate of sodium, with three parts or fine carbonate of lime mixed and reduced to a very fine powder. This mixture may be kept any length of time without alteration in well closed bottles. When moistened with a drop of water and laid by means of the back of a knife on the part of the skin covered with hair, we see in a few minutes and find the thickest hair turned into a soft mass, easily removed by means of water. If it remain on the part long, it will cause a slight irritation of the skin.

Tests for Drinking Water.

In Breelan, the Government have taken some wise precautions to prevent the introduction and spread of cholera, and among these they strongly urge the chemical analysis of drinking water. The following tests are the most important, and quite easily applied: 1. Testing for ammonia with Nessler's solution. Fresenius prepares this reagent by dissolving 3.5 grams potassic iodide in 10 c. c. water, and afterwards dissolving 1.6 grams mercuric chloride (corrosive sublimate) in 30 c. c. water, then adding the latter solution to the former gradually, till a permanent precipitate is produced. Then add a solution of potash until the fluid measures 100 c. c., and filter. A few drops of this solution added to water containing ammonia gives a yellow or brown color. If only a slight turbidity is produced, or a white precipitate, it indicates a hard water, and is caused by carbonate of lime present. 2. Testing for nitric acid. To 100 or 200 c. c. water are added 2 c. c. dilute sulphuric acid and freshly prepared starch paste, containing potassic iodide. If a blue color is produced at once, it is due to incomplete putrefaction. 3. Testing for nitric acid. To 25 c. c. of the water is added 50 c. c. pure concentrated sulphuric acid (60° B.), and, while still very warm, an extremely dilute indigo solution is allowed to drop into it. If the color of the indigo disappears immediately, even when repeatedly added, the water may be considered as suspicious, if not dangerous.—*Artisan.*

DEPILATION OF HIDES WITH CHARCOAL.—Andersen discovered that pulverized charcoal applied to sheepskins produces the depilation of the hair. Charcoal, as is well known, has the property to take up large quantities of oxygen from the atmospheric air, and the oxygen in this form seems to exert a chemical influence on the fatty substance present in the neighborhood of the glands of the hair roots. An oxidation takes place in the pores of the skin, which destroys the glands and loosens the hair. Finely powdered charcoal is mixed with efficient water to make a thin paste, and the hides immersed for 4 or 5 days and well turned over in the meantime, when the hair can be taken off at once. Hides treated with charcoal do not require further treatment, as is the case now with the lime process: and after being washed with water, they are ready for tanning. This will be a great advantage to the tanning trade, as leather treated in this way possesses more toughness, solidity, and flexibility. The other advantages of this treatment are great saving in time and labor, each hide weighs $\frac{1}{2}$ to 1 pound more, and has less spots, the work is more pleasant and healthy, the splitting with the machine is more easily accomplished, and the cost price is the same as with lime, as the charcoal can be used over again. Animal or vegetable coal can be used in any quantity, having no deleterious property whatsoever; and for each hide 6 or 10 pounds, with the necessary quantity of water, are sufficient. The temperature should be 61° or 70° Fah., and can easily be maintained by introducing steam into the vat. The tanning process is facilitated, as no lime is left behind to neutralize the tannic acid.

BRONZING IRON.—To one pint of methylated finish, add four ounces of gum shellac and half an ounce of gum benzoin, put the bottle in a warm place and shake occasionally. When the gum is dissolved, let it stand in a cool place two or three days to settle, then pour off the clear into another bottle; cork it well, and keep for finest work. The sediment left in the first bottle, by adding a sufficient quantity of spirit to make it workable, will do for the first coat or coarser work when strained through a fine cloth. Next get half a pound of finely ground bronze green, the shade of which may be varied by using a little lampblack and red or yellow ochre. Let the iron be clean and smooth, then take as much varnish as may be required, and add to the green color in sufficient quantity. Slightly warm the article to be bronzed, and lay a thin coating over it with a soft brush; when that is dry, if necessary, lay another coat on and repeat until well covered. Take a small quantity of varnish and touch the prominent parts with it, and before it is dry, lay on a small quantity of gold powder with a dry pencil, after which varnish all over.—*Spon's Workshop Receipts.*

COLORS STARCH.—To impart a temporary color to light tissues a German chemist proposes mixing a coloring matter with the starch in "doing them up." If a red shade is desired, take three parts of magenta and twenty of glycine. The magenta is rubbed down in a mortar with a little water, and the glycine added by degrees. Well pulverized starch is then thoroughly incorporated with the color in greater or smaller quantity, according as a pale or deep shade is desired, and the mass is allowed to dry in the air upon a piece of unsized paper. It is then applied to the tissues precisely in the same way as common starch. If a blue, violet, or green shade is desired, suitable colors are substituted for the magenta. Great care should be taken never to use any arsenical green colors in this way, as the dust of the highly poisonous material, becoming detached, may occasion serious mischief.

CEMENT FOR MEERSCHAUM.—Make fine freshly calcined plaster of Paris into a cream with water, by sifting or dusting the plaster into the water, and apply as a cement to the broken parts. It sets in a few minutes, but takes a few days to become dry. It is fire-proof.

GOOD HEALTH.

Hygienic Hints.

Cold Water In the Sick-Room.

Nothing could be clearer to the eye of common-sense than that thirst expresses a need of the organism. A man perspiring freely craves water because his blood is parting with its watery constituents; and drinks are demanded for a similar reason in diseases, such as cholera, attended with wasting discharges. A cholera-patient once exclaimed to me, passing as she drank a glass of ice-water, "Doctor, every swallow is worth a hundred dollars." Cold beverages have the effect in cooling down the body directly by contact, and subsequently by affording water for evaporation from the surface. And hence it is that thirst becomes the most intolerable of all the cravings of patients laboring under fever or inflammation. Children suffer immensely from thirst when indisposed. Their moans and cries, kept up for hours together, often have their origin in this distress, which they can express by no language except these cries; and it is wonderful to behold the relief frequently afforded by a draught of cold water.

Fat Meat for Consumptives.

A taste for fat meat is unfortunately not universal among children, but when it shows itself it is often most universally repressed by parents. This taste is another expression of the wants of the living system which we cannot disregard with impunity. Without fat the organism cannot be built up in perfection. Fate counteracts the tendency to consumption. Observation has established the interesting fact that persons who in early life show a taste for fat meat seldom fall victims to that disease; and, vice versa, that consumptives have generally shown an early repugnance to such food. There can be no question as to the lesson taught by this fact—that when the appetite exists it ought to be indulged, and that it ought, if possible, to be created, when wanting, by tonic and abundant exercise in the open air.

Why a Child Loves Sugar.

The craving of a child for sweets is well known to be one of the most imperious of their appetites. It has reference probably to that ceaseless activity which especially characterizes the age of childhood. It may be that sugar performs in their systems the part enacted by fatty substance in the bodies of adults. As it undergoes oxidation—is burnt up, circulating with the blood—it may be the source of the power which enables them to keep in motion from morning to night. Besides this, it is known that it renders easier and more perfect the digestion of the albuminous food upon which their growth depends. In respect to these offices it is therefore nearly essential to their well-being. And yet how strong, for generations, has been the prejudice against sugar! Under what difficulties, and in the face of what discouragements and protests, have our children obtained the luxury.—*Home and School.*

A NEENER REFORM.—Dr. Hamilton, of Buffalo, New York, tersely says in regard to ventilation, diet, labor, disease, etc.: We need for our dwellings more ventilation and less heat; we need more outdoor exercise, more sunlight, more manly, athletic, and rude sports; we need more amusements, more holidays, more frolic and noisy, boisterous mirth. Our infants need better nourishment than colorless mothers can ever furnish, purer milk than our distilleries can manufacture; our children need more romping and less study. Our old men need more quiet and earlier relaxation from the labor of life. Men, both young and old, need less medicine and more good counsel. Our cities need cleansing, paving, and draining. The Asiatic cholera, the yellow fever, the plague, and many other fearful epidemics, are called the abominations of our age, and our fellow-citizens upbraid us with feebleness and inefficiency in our resources. When will they learn that, although we do not fail to cure these maladies, the more precious secret of prevention is in our possession, and has been for these many years.

CONSUMPTION.—Dr. MacCormac, of London, advances the theory that consumption, or tubercular disease, is caused solely by breathing air that has already been breathed. The contamination of air by carbonic acid, and other organic effete substances, diminishes its power to remove these from the body, and the debris of degeneration being retained, becomes tubercle. He attributes the superiority of Vienna and St. Petersburg, as consumption producing cities, to the universal use of close cloths, and the careful exclusion of air from rooms. M. Collet concludes, as the result of thirty experiments, that the flesh of tuberculous creatures does not produce tubercle in healthy animals to whom it is fed. He believes that when experimenters produced different results, they either experimented on animals already diseased, or allowed the admission to their lungs of tuberculous matter through the air they breathed. M. G. Colvin concludes, from experiments, that the introduction of tubercle into the digestive apparatus of a healthy animal will not produce tubercle in him.

The Law of Fatigue.

Dr. Houghton, in his "Animal Mechanics," states the law of fatigue as follows: When the same muscle (or group of muscles) is kept in constant action until fatigue sets in, the total work done, multiplied by the rate of work, is constant. Suppose a man, walking at his ordinary pace, does not become tired until he has gone thirty miles. If he walks twice as fast, then by this law he would be exhausted at the end of fifteen miles, having done only half the work in a quarter of the time. If he walks three times as fast, he will be tired at the end of ten miles, having done one-third of the work in one-ninth of the time; and so on, the total work done varying as the square root of the time necessary to produce fatigue.

Where the rate of work is very rapid, as in a boat-race, it is of course impossible to keep it up for any great length of time. The actual amount of work done in such a case is thus illustrated by Dr. Houghton: A good idea may be formed of the rate in which the muscles give out work in a boat-race, from comparing this work with the average daily work of a laborer. As many kinds of labor there are 400 foot tons of work accomplished in ten hours. The oarsman performs (this is arrived at by calculation) in one minute the 100th part of his day's labor, and if he could continue to work at the same rate, he would finish his day's task in one hour and forty minutes, instead of the customary ten hours. The work done, therefore, in rowing one knot in the seven minutes, is, while it lasts, performed at a rate equal to six times that of a hard-worked laborer.

Dangers of Well-Water.

The dangers of bad milk are engrossing so much attention just now, that there is no reason to fear lest the far greater danger of bad water should for the time be overlooked. We trust this serious error will not be committed. For one sample of dangerous milk a thousand of dangerous water could be obtained in almost any part of the country. Let it never be forgotten that very few rivers or wells are safe sources of water supply, and that as many are unsafe as loaded fire-arms. The shallow wells of villages are among the pests of the country, and it is high time that a zealous and well organized crusade should be brought to bear upon them. It is sickening in most country places to observe the uniformity with which the cesspool and well are made to stand side by side, as though each were necessary for the other; and to think of the twenty feet or so of foul, sewerage-reeking soil through which the water percolates to its fabled bed! The question should engage the attention of every health officer, and will, in too many cases, tax his energies severely, for it is one of the hardest sanitary problems. It is always possible to provide a city or town with good water, but in a village, where houses are few, money scarce, and intelligence scarce, it is a matter of exceeding difficulty.—*London Lancet.*

THE REASON WHY YOU CRY.—Darwin says: Weeping is probably the result of some such chain of events as follows: Children, when wanting food or suffering in any way, cry out loudly, like the young of most of other animals, partly as a call to their parents for aid, and partly from any great exertion serving as a relief. Prolonged screaming inevitably leads to the gorging of the blood-vessels of the eye; and this will have led, at first consciously and at last habitually, to the contraction of the muscles round the eye in order to protect them. At the same time, the spasmodic pressure on the surface of the eye, and the distention of the vessels within the eye, without necessarily entailing any conscious sensation, will have affected, through reflex action, the lachrymal glands. Finally, through the three principles of nerve force readily passing along accustomed channels of association, which is so widely extended in its power, and of certain actions being more under the control of the will than others, it has come to pass that suffering readily causes the secretion of tears, without being necessarily accompanied by any other action. Although in accordance with this view we must look at weeping as an incidental result, as purposeless as the secretion of tears from a blow outside the eye, or as a sneezing from the retina being affected by a bright light; yet this does not present any difficulty in our understanding how the secretion of tears serves as a relief to suffering.

COFFEE AS A DISINFECTANT.—The *Homeopathic World* says that coffee, when roasted, is one of the most powerful means, not only of rendering animal and vegetable effluvia innocuous, but of actually destroying them. A room in which meat in an advanced degree of decomposition had been kept for some time, was instantly deprived of all smell on an open coffee roaster being carried through it containing one pound of newly roasted coffee. In another room the effluvia occasioned by the clearing out of a cesspool, so that sulphuretted hydrogen and ammonia could be clearly detected, was entirely removed within half a minute on the employment of three ounces of fresh coffee. The best mode of using it as a disinfectant is to dry the raw bean, pound it in a mortar, and then roast the powder on a moderately heated iron plate, until it assumes a dark brown hue, when it is ready for use. It must, however, be remembered that the coffee, to be effectual, should be perfectly pure. Adulterated rubbish will only make matters worse.

A Prolific Rose Bush.

The fact that the avowed mission of the *Paras* is rather utilitarian than æsthetic, does not prevent us from describing and illustrating a marvellous rose tree at Santa Rosa, Sonoma county, in this State. The photograph from which the accompanying engraving was made, was taken in June last. We would remark that this splendid specimen of a rose bush had been as full of roses throughout as on the thickest portion represented; but when the photograph was taken, portions of the bush had been left of many of them, and therefore are not represented. Mr. O. P. Fitzgerald, writing from Santa Rosa, and describing the bush, says:

This rose adorns the cottage of my friend S. A. Rendall, the photographer of Santa Rosa. It was planted in 1858, and is of the Lamarquo variety, the most beautiful of the white roses. But how describe that which is essentially indescribable? Imagine an immense bouquet of white roses, twenty-five feet high, twenty-two feet across, beautifully rounded, with a blooming surface of four hundred square feet, with four thousand full-blown roses and twenty thousand buds!

There is the truthful statement, but not the picture—my pen cannot describe it. I could as easily write a poem of the first order. The stem, near the ground, measures twenty-four inches in circumference; just above the ground it separates into three principal stems that grow over twelve feet to the cottage-eaves without lateral branches. These main stems pass between the eaves and a strong support attached to the house. Enough!—my pen is impatient of these dry details, and would leap into poetry—if it could. I have seen many of the finest paintings and statues of the great masters; I have seen the tropical flora in all its gorgeousness; but this rose-tree was the most beautiful work of Nature (with a little aid from man) my eyes ever beheld. Santa Rosa! appropriately and sweetly named! It is at this season a city of roses. They bloom in almost every yard, and shed their sweet perfume all around. Flowers are a luxury enjoyed by the poor as well as the rich. They cost nothing but a little labor, and that labor a delight to every healthy mind. That wonderful rose over friend Rendall's cottage door and roof, as a transient of the beautiful, is of more value than any painting to be found in the halls of our money-kings—yet it has never cost the price of a bad cigar. With our climate and soil, our California homes should be the pleasantest on earth, and nothing but laziness or lack of taste will prevent them from being so.

Mr. Rendall has photographed this Koh-i-noor of the roses. It makes a beautiful picture, but when I look at it I sigh to think how poorly the best productions of human art can compete with nature.

THE SIAMESE TWINS.—A dispatch from Mount Airy, N. C., gives an interesting conversation between a correspondent and Dr. Hollingworth, who was the first physician to arrive at the residence of the Siamese Twins, after their death. Dr. Hollingworth does not believe Eng's death was caused through any vital connection or artery passing through the ligament connecting the twins. He does not believe in the existence of any vital connections. He had attended them frequently when one had been sick and the other in good health. He often noticed two beats of the twins' pulses differing in time. Eng's death was undoubtedly due to shock and terror, inspired by his union with Chang's dead body. An attempt to sever the ligament, after Chang's death, would only have hastened the death of Eng, by increasing his terror. The friends of the twins maintain that an artery was contained in the ligament, and that after Chang's death the blood from Eng's body flowed into Chang, but that there was no response of the artery, and that Eng died from exhaustion and loss of blood. Up to the time of Eng's death the ligament was quite warm to a point where it entered Chang's body. The ligament was four inches wide and as thick as a man's wrist, and extended from the abdomen of one to that of the other, and the navel of the twins was in its center. The bodies have been temporarily interred. Several leading physicians have left Philadelphia for Mount Airy to make an examination of the remains. Complete arrangements have been made for the autopsy.

The next meeting of the California Academy of Science will be held in their new quarters, at the church, corner of Dupont and California streets.

Silver Bullion.

The silver bullion question of the Pacific coast is now agitating the minds of the California and Nevada Senators and Representatives in Washington. On the Pacific side of our country silver coin is a drug in the market, while on the Eastern side the Mint at Philadelphia cannot supply the demand. This month the demand for subsidiary coins exceeds the supply about \$350,000. In San Francisco silver coins must be shipped mostly East for a market, and the holder of bullion is forced to sell at a greatly depreciated value. A Washing-

at the Philadelphia Mint and the New York Assay Office, at 118 cents per standard ounce, payable in silver coin, to which price it has been reduced from 122½ cents. The ratio fixed by the Department for San Francisco is 116 cents. But it is believed, and is urged upon the Department that Secretary Richardson has power under the above quoted provision of the law to purchase silver bullion whenever he pleases, and pay for it with silver coins at the Philadelphia Mint or the New York Assay Office. It is therefore suggested that the Director of the Mint be authorized to order the purchase of silver bullion for coinage into subsidiary coins at the San Francisco and Carson Mints, and to issue certificates therefor, payable

The Stickeen River Mines.

The excitement concerning the Stickeen River mines still continues. About fifty miners left Portland, Oregon, on the 21st instant for the mines, per steamer "California." Quite a number of miners in this State are preparing to leave for that country in this spring; and we have received recently several letters asking for information as to rates of fare, route, character of the country, etc. We have published, from time to time, such information on the subject as came to our notice—but little seems to be

known of the country as yet. Last April we had a conversation with Mr. Peter Cargovitch, who had been to these mines, and who is there now. He left this city some time in May, with a party of experienced prospectors, and intended thoroughly testing the country. He represented the mines as very rich, and stated that while the bars on the river were almost "forty-nine diggings," there were also large banks partaking of the character of our California hydraulic diggings. At the time of a former expedition, of which Mr. Cargovitch was a member, several men died of scurvy and hardship. Mr. Cargovitch has written one letter since he left which was from Buck's Bar, on the Stickeen. He spoke of having made some discoveries 125 miles north of there; where, with rookers, the men made from two ounces to \$180 per day, to the hand. The gold is quite coarse. He states that all the miners coming down had full purses, and report the mines looking well and rich at that time, (October 24). He was waiting for the ice to melt before going to the mines.

The country in the locality of these mines is an inhospitable one; the season is short and hard fare and inclement weather the rule. Silver has been found in the vicinity, as well as gold. The mines are situated on the tributaries of Dease's lake in the British possessions. The route from this city is as follows: From here to Portland 733 miles; from Portland to Victoria, 308 miles; from Victoria to Nanaimo, 74 miles; from Nanaimo to Fort Wrangel 768 miles; all by steamer. The fare from here to Portland is \$30 in cabin, and steamers run three times a month. The fare from Portland to Fort Wrangel, near the mouth of Stickeen river, is \$50 in the cabin and \$35 in the steerage. At Fort Wrangel prospectors leave the steamer and go up the Stickeen river in small boats to Buck's bar, 160 miles from the mouth. This is at present the head of navigation, and if the mines hold out, steamers will be used instead of small boats. From Buck's bar to Dease's lake, 160 miles, the route is overland, with no trail as yet, and through a bad country. From the lake to Dease's creek is 15 miles, and Tibbet's creek is 25 miles further on.

The McKenzie river into which the lake empties has been prospected some 450 miles and good prospects have been obtained on it. The pay gravel is about 4 or 5 feet deep on Dease's creek and the gold is rusty. Big stories are told about the amount to the pan that has been washed out, but most of these stories should be taken "with a grain of salt." The fact that several men who have been there before, have returned, again is in favor of the country, but its distance from civilized communities, hard climate, want of roads, shortness of seasons, etc., is against it. When the trail is established across the country there will probably be a big rush for the new mines. We have no means of knowing the expense attendant on the trip after leaving Fort Wrangel, for it is performed in small

boats and overland, and would vary with different parties. Of course parties going there must be well fitted out, as the last trading port is on the Stickeen river before Buck's Bar is reached. At the latter place a number of miners are wintering.

Parties have secured from the local government a charter to cut a trail from Buck's Bar to Dease's lake, but it has not yet been made. One of our correspondents also asks about the Stickeen river, saying that he cannot find it on the maps which he has seen. The river is not marked on any but recent maps. It rises in British Columbia and empties into the Pacific ocean in the southern part of Alaska, northeast of Prince of Wales Island. It is sometimes called by the name of Francie river. The upper portion of the river is where the mines are found and they are therefore in British Possessions.

RECEIVED.—We have received from F. M. Shaw, now in London, a paper read at 55 Caele street, before the Social Science Reform Club of London and Los Angeles, California.

A FLORAL KOH-I-NOOR.

ton correspondent of the *Chronicle* is informed by Dr. Linderman, Director of the Mint, that the San Francisco and Carson Mints might easily have coined half a million dollars of silver coin more during the last month than were coined if there had been a demand for the increase. Our Pacific coast interests suffer a great loss on account of the depreciation of silver.

Senators Sargent and Stewart have been investigating the matter, and will urge the Secretary of the Treasury to take some action to benefit the interests of their constituents. How they propose to have it done is briefly stated as follows:

The 28th section of the Coinage Act provides that for two years after the passage of the Act (February 12, 1873) "silver coins shall be paid out at the Mint in Philadelphia, and at the Assay Office, New York, for silver bullion purchased for coinage, under such regulations as may be prescribed by the Secretary of the Treasury."

Under the above authority silver bullion has been purchased and paid for in subsidiary coin

in such coin at Philadelphia or New York, as desired by the depositor.

This plan would enable the holders of bullion to sell their silver at 116 cents, without trouble or commission, at the Mints of the Pacific coast. The certificates would be worth a premium for exchange, and the Government would ship its coin from the Pacific, making six per cent. profit on its investment in bullion.

The demand for silver coin from Texas and Central America is larger than can be met by the Philadelphia Mint. If the plan under consideration should be adopted, the coin made from the bullion purchased would be sent to New York on Government account to be applied in payment of checks issued in the purchase of the bullion. It is not contemplated that this coinage shall interfere with the necessary gold and trade-dollar coinage, but will keep the Mints at work to their full capacity.

THE Ruby Consolidated furnace at Enreka has shut down for a few weeks, and the K. K. furnace will close in a few days.

Mining in San Diego.

In an article headed "We Should Encourage Mining Developments," the San Diego *World* says:

We have frequently expressed the opinion that we have in San Diego county gold mines, which can be made as productive as any on the Pacific Coast. The decision of the Cuyamaca case in favor of the miners, by Commissioner Drummond, opens up the superb Julian region to the outside capitalist who had, hitherto, been repelled by the specter of an uncertain litigation. While the Julian miner might hope and believe that the issue of that litigation would be favorable to him, he had no way of overcoming an outsider's natural objection to buying into a law-suit. Very few persons would take the trouble to inquire into the merits of the controversy, and over all was the bug-bear that the right, even when made apparent, does not always prevail.

The miners having triumphed, already outside capital has begun to flow into the Julian and Baumer Districts. A San Francisco company has already purchased the Golden Chariot, giving a considerable sum for that fine mine. Our own belief is that they have bought, for a fraction under one hundred thousand dollars, a mine that can be made to yield three or four millions in the next four or five years. But the mine has not been sufficiently developed yet to make any speculation a certainty. The gentlemen who have put their money in the Golden Chariot have of course made up their minds to take the chances. They are gambling for a big stake, and we think they will win beyond peradventure. We believe they can make their mine yield \$50,000 a month when the proper improvements are made, and we think, further, that the Julian mountains are incomparably richer than Grass Valley. Yet, before the owners of the Golden Chariot can realize their expectations, they will have to expend at least thirty thousand dollars in addition to the ninety thousand they have given for the mine. These are large outlays, and there is a certain margin of risk in the operation. To encourage them they know that they own a mine which has already yielded upwards of one hundred thousand dollars, and that its rock, from the very surface, and from the first day on which the mine was discovered, has averaged \$118 to the ton.

We have no hesitation in saying that these men ought to be encouraged. Other fine mines besides the Golden Chariot, such as the Stonewall, belonging to Frary & Farley, the Owens, and many besides, invite the introduction of outside capital. There are certain drawbacks which can be removed, and from which the miners have suffered very grievously. The tax-gatherer has been unremitting in his attentions to the Julian miner. With the exception of the Owens, there is hardly a mine in those districts that has been sunk to a depth of one hundred and fifty feet. Of course mines in this condition cannot be said to be developed. They are really in their infancy. The men who are pushing their shafts into the bowels of the earth, and running levels to drag out masses of gold, should be visited very tenderly by the tax-gatherer. Yet the facts are that the miners have been quite heavily taxed, and at a time when they needed forbearance most. When the Golden Chariot was approached simply by a bridle trail, when it had not even a whim and when its ore had to be packed to the mill, three miles, on jackasses, the proprietors had to pay \$1,200 per annum to support the State and county government. At that time they had hardly burrowed their way into the ground up to their eyes. The practice has been to make the miner pay tribute from the very moment he has displaced the sod. The Stonewall has been made to submit to similar exactions. Of course this is very dispiriting to men who are struggling to develop reasonably supposed to be rich, but whose riches are as yet locked up in the bowels of the earth.

Let us take a very supposable case, that in which one hundred thousand dollars, by legitimate mining standards, is supposed to be "in sight." The wealth is there, but, until he has laboriously unearthed it, it counts no more to the miner than a similar sum, standing in somebody else's name, would locked up in the vaults of the Bank of California. To tax him on a sum which he can only hope to realize as the result of persistent, skillful and expensive labor, as though it were cash to his credit in bank, is not to encourage mining developments. A far better policy would be to offer a bonus for mining energy, instead of practically repressing it, as the present policy does.

Although the Julian people have not been loud-mouthed in the expression of their grievances we know they feel them keenly. The present is a favorable conjuncture, and outside capital can be easily diverted from Nevada to the Julian region. Our mines themselves, gauged by their present development, are of unexampled richness. We should encourage all who wish to extend them and increase the yield of gold. We should instruct our assessor to take note of such machinery, money and property as the miner has, and to assess them, but to let his mine alone. Its value is necessarily prospective and indeterminate, and all we ask is that the miner should pay tribute on his gold as he brings it to the surface. The hardships worked by the present system are felt by the miner to be intolerable. We happen to know that, last year, one of the most energetic, industrious and successful of all the Julian miners, at a time when he was paying three per cent. a month on ten

thousand dollars borrowed to develop his mine, was obliged to pay a tax of nearly six hundred dollars on its prospective value. We should set about remedying such an unnatural state of things, and the sooner the better. The Julian miner will cheerfully pay a tax on his machinery, his real estate and his personal effects and that is all he should be asked to pay.

If the course we recommend is adopted, a very great dissatisfaction will be removed at the mines and we shall really have offered a premium on their development.

Ancient Lakes of Oregon.

Professor Conder, State Geologist of Oregon, is giving a series of lectures in Portland, some of which are reported in the *Oregonian*. That paper says:

The subject for the sixth lecture was "The Ancient Lakes of our Interior," and many fossil remains, taken from various points in our State, both east and west of the Cascade mountains, were exhibited by the speaker to substantiate his theory that the great sea once covered all this coast, and extended clear to the borders of Kansas.

Several facts have been proved in prior lectures. Among them were—

First—That the whole Pacific slope was once a sea bed, a fact proven by the presence of rocks in all parts containing shells of animals known to have inhabited the sea only.

Second—That the pressure that elevated or raised this country up out of the water came from the Pacific ocean. This was demonstrated by the inclination of the strata or layers which bore any indications of having been disturbed since their deposit. The folds or strata indicate the direction in which the force that tilted them up was applied, so that there was no danger of mistake on this point.

Third—That the Pacific ocean is now deeper than it once was, which was shown by soundings made in the vicinity of coral reefs. Corals never work in water deeper than 125 to 150 feet, while their reefs are often found to exceed ten thousand feet down. That the settling of the bed of the ocean has kept pace with the rise of the reefs is the theory upon which this was explained.

Fourth—That the settling of the bed of the ocean was the result of cooling of the earth's crust. This process of cooling would crumple the earth's surface just as the shrinkage of an apple would leave the skin wrinkled in folds. So the settling of that part of the earth's crust constituting the ocean's bed would necessitate the upheaval of other portions, as in the falling in of one part of an arch, other parts are pushed outward. In this process, the pressure would be greater where there was the most water, and if we go a thousand miles to the north, where the Pacific ocean is the narrowest, we find the mountains lowest, and if we go two thousand miles southward, we find opposite the vastly wide part of the ocean, the very high mountains of the Andes.

The Pacific coast consists of three great plains. From the first or southern slope the waters which once covered them were drained by the Colorado river. From the central plain the waters were gradually dried up by evaporation, while from the northern slope the vast body of water that once covered it was carried off by the channel of the Columbia.

We infer that when the causes of disturbance operated, the strata had all been deposited. If we find two of these strata upheaved or crumpled, and a third overlying these, not so upheaved, we infer that this stratum has been deposited since the causes which produced the upheaval of the other two were in operation. The upfolding of the earth's crust which formed the Blue Mountains, in the eastern part of our State, began in the eocene period, was quite active in the eocene-tertiary, and ceased in the pliocene—and since that time no great convulsions have taken place. In the days of these upfoldings there were no mammoths, and none of their remains are found in the rocks of the eocene period. The Blue Mountains have not been connected with the older parts of the continent by the withdrawal of the water. These mountains were the nucleus of what now constitutes Oregon, and were the first part which appeared as dry land, though some parts of Southern Oregon were very old, and further explorations might upset this theory of the greatest antiquity belonging to the Blue Mountain region. In those days, plant life was abundant, and many beautiful specimens existed. Among the trees were the palm, yew, maple, alder, etc. They grew a very beautiful tree, and shed its branches instead of its leaves. Many of these branchlets are still preserved in the rocks, in a petrified form.

The surface in the vicinity of these mountains is generally of volcanic material, though granite and basalt are frequently found. The heat produced by the pressure from seaward sometimes changed the appearance and chemical character of the rocks on the coast. The Coast Range contains many more indications of being an old east-up sea bed than do the Blue Mountains or the Cascades.

The upturned edges of the folded strata can be seen along the western foot of the Cascade and eastern foot of the coast range. These strata dip under the Wallamet Valley, and the same extend northward to Sitka and southerly beyond San Francisco. The Deschutes river flows through a basaltic rock, in some places over three thousand feet thick, the southern through a basin or old lake-bed. Going eastward from the Deschutes, we come to John

Day's river. At the great bend in this last stream the basalt only capped the hills; the great molten bed which had flowed out of the Cascade mountains, cooling as it traveled, was three thousand feet thick at Deschutes and only a few feet thick at John Day's. From the high hill at the bend of John Day's one can see for sixty miles one of the most beautiful collections of rocks on the globe. They are of all forms and all colors. These rocks indicate the fact that a stream of lava once ran through this basin, visible from the hill named. The basin is the bed of an old lake. In it are found many curious remains, among them those of the three-hoofed horse and camels. Many of the same animals existed in Oregon in the pliocene-tertiary period, that are now found in Asia.

The speaker concluded by expressing his confidence in this theory of the comparatively modern origin of man, though the finding of human bones in any period would not upset a single article in his creed. He had not, as yet, been permitted to visit Southern Oregon, and exploration in that region might discover a great deal, as it seems to be an old country, perhaps older than the Blue mountains. Standing on Spencer's Butte, and looking over a large portion of Linn, Benton, Polk, and Yamhill counties, one can but feel the conviction that the vast area before him was once an inland sea, and similar impressions are felt when looking at the country from John Day's Hill, in Eastern Oregon, and the Yakima Heights in Washington Territory.

The next lecture will be on "Surface Facts in Oregon," and will treat of the course of river and mountain ranges, and the glacial theories.

White Pine Mines.

In times of general apathy and universal business stagnation, people are inclined to look upon the dark side of things, and forget for the time the really intrinsic worth of their industries. In no community is this fact more apparent than with us at this time. For a number of seasons White Pine District has been suffering from a great and overpowering reaction, naturally consequent upon a fall from a position in the mining world, second to none in the history of Nevada, to an almost total stagnation of business in all branches. But let us look at the causes of this state of facts. It is not because our mines are worked out, or fail to respond to the earnest and faithful workers in the shape of good pay ore, but it is because no systematic, legitimate mining operations have been carried on here since the commencement of our history. In only one instance have the owners of truly valuable properties in the district made mining a business, and that is in the case of the Eberhardt & Aurora. The results of their persistent efforts are becoming every day proofs of the existence of large bodies of ore in Treasure Hill, and, at the present time, the prospect for a continuation of precious mineral to an indefinite depth is fully established. While other companies have been scraping up the ground, scratching here and there for rich ore, this English corporation have been working intelligently and with a purpose. The history of the company mentioned could be repeated over and over and again did the owners of property display the same amount of energy, or have a desire to make mining a legitimate business, instead of a means to inflate and depress stocks on the market.

No man who has visited Treasure Hill during the past year, that has a grain of knowledge of mines and mining, can truthfully dispute the self-evident fact of the existence of ore in large quantities in the Ward Beecher Consolidated. Still the mines of the company have not been worked during the past winter. Not a man has been employed outside of the necessary number required to act as watchmen, etc. As in years gone by, we have waited for the inevitable "spring rise," so now we are anticipating great things the coming season; but have we any more reason to hope for better times than were experienced last summer? The winter, thus far, although we have had a number of severe storms, has not been such as to prevent working the mines, and for only a short period were the roads rendered impracticable for teams, still nothing has been done outside of the company mentioned. Rumor comes to us of a probable change of ownership in one of our leading mines, and, in common with all our people, we sincerely hope an arrangement can be arrived at. It is shameful that a country capable of producing so much bullion should be allowed to remain idle, carrying the impression among outsiders of its worthlessness, when a small amount of energy would soon bring it as prominently before the public as its merits deserve. We hope for better times. We trust that in the coming summer the clouds so long resting over us may break away and leave us a clear sky of prosperity, such as we have waited so long to realize.—*White Pine News*.

The Japan Gazette states that in future all agreements between native and foreign mining engineers must be referred to the heads of En or Ken, and by them laid before the Survey department and the Foreign office. It is also to be a *sine qua non* that the foreigners engaged do no other business than that provided for in the contract.

A New Tunnel Project.

The White Pine *News* says: During the past week a project, new to all but the projector, has been inaugurated, and seems now in a fair way to be successful in its culmination. For the past three years W. F. Walton, one of the early settlers in Hamilton, and now owner of a considerable portion of town lands, has had in view the tunnelling of White Pine mountain. In the early inception of the enterprise capitalists were favorably disposed toward the undertaking, but the sudden break in our mining interests in the last two years has detracted considerably from the interest manifested. But through all this time Mr. Walton has clung firmly to the idea of the feasibility of the project, and, other means failing, has commenced soliciting for aid among us at home. In view of the known and indisputable wealth contained in the locality named, a fact needing no other illustration than a visit to the ground, the enterprise suggests itself as one that will prove remunerative to those engaged in its development and beneficial to the whole country, particularly this district. It is proposed to raise an amount of money, small in itself, to defray the expense of visiting Washington, for the purpose of obtaining a grant and franchise from the Government, to prevent any interference with the title to the land needed for the prosecution of the work, and also to solicit the aid and support of such members of Congress as may be well disposed toward the development of a country rich in precious metals. No subsidy will be asked from the Government, only the privilege mentioned, it being the policy to form a corporation and place stock upon the market.

At first glance this would seem to be a stupendous undertaking, but, taking as a precedent the Suto Tunnel project, now nearly completed, it is made to assume proportions of feasibility, and one that can be easily carried through to completion. We are pleased to see our people taking so much interest in the undertaking, as illustrated by a subscription list shown us by Mr. Walton, and the first step seems to be indicative of the result. Our representatives now at Washington could find no project which would accrue more to the benefit of Eastern Nevada, or the State in general, than the one in question, and, in view of the fact, that no work has been laid out for them to do which might aid our prosperity, it seems to us this enterprise should demand their attention as something of more than ordinary moment. For a number of years mines have been worked on White Pine Mountain by private individuals, resulting in products of ore valuable enough to defray the cost of sending them fifty miles to mill, and leaving a large profit to the owners. There are numberless locations made on this mountain which are all more or less developed, but rendered useless through want of proper means of reduction, which could be made valuable by means of a tunnel cutting the vein at a depth. We trust our people may see their own interest in the success of this project, and aid by all means in their power its inauguration. In our next issue we shall publish the names of the parties subscribing, with the amount set opposite their names. In the meantime we hope all may see the advisability of the undertaking, and lend their influence to it.

TURQUOISE MINES IN EGYPT.—A brief but interesting account of a discovery in Egypt is published in the "Proceedings" of the Antiquarian Society. An Englishman traveling on the skirts of Sinai, noticed small blue tones lying in the beds of dried-up torrents, and brought a few to England, where he learned that they were turquoise of good quality. He went back to Egypt, made further researches, built a house at the junction of three valleys, and aided by friendly natives whom he took into his service, he discovered the turquoise mines formerly worked by the ancient Egyptians, together with some of their tools, and the places where they ground and polished the stones. So now turquoise are dug from these old rocks and sent to England. Ancient iron works have also been discovered with huge heaps of slag piled around them. A specimen of this slag on being tested was found to contain fifty-three per cent. of iron, which favors the supposition that it would pay to smelt the whole mass over again. To protect these valuable deposits, the Pharaohs built fortifications, and a barrack, and a temple, for the troops, relics of which still remain.

ALUMINUM FOR SMALL COIN.—Apocryphal to a project for remodeling the coinage of Germany, Dr. Clement Winkler has published an essay in which he strongly recommends the use of aluminum as the best metal for small coins. After giving an elaborate history of the fabrication of aluminum, the author seeks to prove that the properties of this metal are exactly those required for coinage. The density of the metal is about three and one-half times less than that of the alloy of copper and silver now in use. Dr. Winkler recommends that small coins of pure aluminum be struck off, and observe that an alloy of silver and aluminum might advantageously be substituted for the alloy of silver and copper now used for large coins. He thinks that the metal is susceptible of more numerous applications than have yet been made.

Silver City and Mines.

Silver City is the county seat of Owyhee county, where the richest and best developed gold and silver quartz mines in Idaho Territory are located. It is compactly built, in a cañon, mostly on the west side of Jordan creek, and has about 1,200 inhabitants. It is 60 miles south of Boise city, the Capital of the Territory, and 210 miles north of Winnemucca, its nearest and chief shipping point on the Central Pacific Railroad. Correctly speaking, Silver City has only two seasons—the summer and the winter—of six months each. In summer the weather is delightfully clear and pleasant; in winter snow falls to a depth of five or six feet, and violent storms occasionally prevail, although the cold is by no means severe, the mercury scarcely ever dropping to zero. Its chief resource is quartz mining, although the placers are extensively worked while the water from the melting snows continues in the spring.

Among the principal quartz mines are the Oro Fino, Ida Elmore, Golden Chariot, Minnesota, South Chariot, Red Jacket, Mahogany, War Eagle, Empire, Silver Cord, Idlewild, Illinois Central, Glenbrook, Belle Peck and others, all of which are situated on War Eagle mountain about two and a-half miles from town, and employ from 500 to 600 miners the year round. Their bullion product during 1873 aggregated about \$1,000,000, and will probably double that amount for 1874.

The houses in Silver City are mostly constructed of wood, although there are a number of fine granite buildings in the portion of the town known as Granite Block. Silver City is 6,000 feet above the level of the sea, and the summit of War Eagle is about 1,800 feet higher.

The adjacent mountains in summer, and the foothills and valleys in winter, afford a magnificent stock range, and stock raising is rapidly becoming one of the most important branches of industry in the country. Some of the mountain peaks, near Silver City, are covered with perpetual snow, which is used as a substitute for ice by the inhabitants during the summer time.

The climate is exceedingly healthy, and the people of Silver City and vicinity are among the most generous-hearted and sociable in the world. Business is prosperous, and, taken altogether, it is a good place to call home.—*Advocate.*

ALASKA COAL LANDS.—A bill to provide for the extension of the United States system of land surveys over the Territory of Alaska, has been framed, but has been nipped in the bud by opposition from the Interior Department. Last winter a bill for the sale of coal lands was passed, and provision was made so that tracts of unsurveyed land could be held by performing a certain amount of work and continuing the same until the surveys were made, when the holder would have the preferred right of entry to the land. A number of speculators, whose headquarters are in San Francisco, succeeded in getting the coal fields of Alaska included within the Act. They have formed companies and dispatched agents to take possession of large tracts of the most valuable coal lands in this Territory, the existence of which is only known to a few men, and now, in order to perfect their grabs, they expect Congress to pass a bill to extend the survey over them. Commissioner Drummond has addressed a letter to Senator Mitchell in opposition to the scheme. There are rumors also of a combination to control and monopolize the resources of that Territory, but there is a disposition among members of Congress to investigate them all. A movement will be made toward having a Commissioner appointed to examine the whole subject and at the same time to report upon the manner in which the Alaska Seal Fur Company is fulfilling its contract with the Governor.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittance of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agencies.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

The Mining & Scientific Press,

Started in 1850, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal, for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi. As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrious Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble station, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

EACH ISSUE CONTAINS

Sixteen well filled pages.
Original and Choice Engravings.
Editorials on Home Industries.
On various kinds of Stock-rearing.
On Horticulture and Gardening.
Correspondence from Farming Districts.
Answers and hints to Correspondents about Local Farming.
Good Health and Useful Information.
Reports from Granges and Farming Clubs.
Mechanical and Scientific progress.
Agricultural Notes from all quarters.
Domestic Produce Markets.
Home Circle.
Domestic Economy.
Mechanical Hints and Domestic Receipts.
Home and Farm Matters.

Affording, in all, more of real instructive and profitable matter for general readers than any other weekly on this side of the Continent.

DEWEY & Co.,

Publishers, No. 338 Montgomery street, S. F.

POPULAR LECTURES.

Prof. Neri's Lecture on Electricity.

The second of the series of lectures on electricity, by Prof. Neri of St Ignatius College was given at the hall on Jessie street, on Thursday evening of last week. It was in the main, according to previous announcement, a repetition of the first, which could not be accompanied by the usual demonstrations on account of the condition of the atmosphere at that time. A very large and most attentive audience was present, a fact which speaks well for the growing taste for scientific information in San Francisco.

The History of Electrical Science.

Electricity was but little known to the ancients. It was originally detected in amber—the electron of the Greeks, and hence the name of electricity. It was also long afterwards found to exist or be developed by friction in several other substances. The phenomenon was originally explained by regarding it as the soul of amber; hence it was regarded with awe. No progress however, was made either in determining its character, or utilizing its existence for some 2,500 years—or until about 200 years ago, when the attention of scientists first began to be especially attracted to its study. The result of this study soon developed the fact that this strange principle was the cause of some of the most important phenomena of Nature; that it extended its influence throughout the universe, and that it had an intimate connection with both animal and vegetable vitality. It also led to many developments in kindred sciences, in the introduction of new means of wealth, and in the furthering the general progress of civilization. The lecturer introduced various experiments with glass rods, sticks of sealing-wax, etc., and demonstrated the existence of two kinds of electricity—vitreous and resinous or positive and negative, and attracting and repelling.

What is Electricity—Its Nature, Etc.?

Notwithstanding the progress which has been made in modern times in studying the various phenomena of this wonderful agent, we are still quite as unable as were the ancients to answer this question. All we have been able to do is to collect and systematize facts. For a long time it was thought to be an imponderable fluid, or rather a compound of two different fluids; but that theory is now fully exploded, and the idea is only kept up for the convenience of illustration. Electricity is, probably, simply a condition of the molecules of matter. [A mode of motion—the molecules in a certain condition of motion?—REPORTER.] It is also found that this condition exists only on the surface of bodies—everywhere alike on the surface of a sphere, but tending to the points of elongated bodies. This fact was shown in various ways. In a hollow sphere—no matter how thin—there was no electricity on the inner surface; it was all on the outer. When a given, insulated sphere was encased in another and outer one, the electricity instantly left the surface of the first and arranged itself on that of the outer sphere. Even a cotton net with open meshes was electrified only on the outer side, and the electricity was reversed if the net was turned wrongside out. These facts were very distinctly demonstrated with suitable apparatus. Very delicate instruments were shown for detecting the presence and measuring the intensity of the electric fluid upon any given body.

The Principle of Induction

Was explained and beautifully demonstrated with elegant and costly apparatus. The simple apparatus first used by Volta in demonstrating this principle was shown. Inductive electricity is that which has been generated by friction, etc., and then conducted to another body by a suitable conductor. This discovery we owe to our own Franklin. The charging of the Leyden jar is made possible through this principle of induction, multiplying which, a battery is formed capable of killing by a single discharge the strongest ox. The simple experiments in this direction lead to gradual improvements in instruments for generating electricity, until from the tiniest spark which was all that Franklin or Volta could produce, we have now machines that will develop a continuous chain of sparks six or seven inches long—miniature chain lightning, which in a darkened room falls with almost blinding influence upon the eyes. Several of the various electrical machines were shown, exhibiting the gradual progress which has been made in this direction from Franklin's time to the present day—the latest of which is a novel and powerful machine lately devised by Carré of Paris, and which was received here only a few days previous to the date of this lecture. This machine combines both the frictional and inductive principle, and possesses a means of greatly intensifying the current, which was shown but not explained by the lecturer.

During the last century, as such machines have been gradually improved, experimenters have been at work with great earnestness and success. At first such experiments were conducted quite privately, and the experimenters were regarded with a species of awe and admiration. Men of learning and influence esteemed it a great favor to be admitted as spectators.

Our own Franklin was one of the most successful of such experimenters. Spirits (alcoholic) were set on fire, gas was lighted and guns were fired by this mysterious agent. [The lecturer might have mentioned here, as one of the most important experiments, that performed by Franklin of drawing lightning from the clouds, thus proving, by actual demonstration, what was only suspected before—that this electricity produced by friction was identical with that developed in the thunder cloud.]

Several Beautiful Experiments

Were here shown by the aid of the same machine, one of which consisted in causing the electric current to pass through a long glass rod, and repeatedly around a glass globe by means of a detached conductor, whereby the fluid assumed the appearance of a glowing chain of fire. The profile of Franklin was also flashed out in electrical fire by means of a similar device. The electrical chimes were also another pleasing feature. But perhaps the most interesting experiment of all was a demonstration of the power which the human body possesses of becoming an accumulator of electricity—a living Leyden jar.

Lighting Gas with the Fingers.

A young lad, standing upon a stool insulated with glass legs, when placed in connection with the same machine, was able, by merely pointing his finger near a gas burner, to light the same; eight or ten jets were thus successively lighted; and small dishes of naphtha were also set on fire by the same means, sparks were also drawn from any part of his body wherever the professor brought his knuckles in close proximity to the same. The power and influence of points was here explained by the virtue which of Franklin's invention of the lightning rod was suggested and made practical.

Electricity from a Steam Boiler.

Another interesting and quite novel experiment consisted in the demonstration that electricity is generated by escaping steam, and, when the boiler is properly insulated, diffused throughout every portion of the boiler and iron-work connected therewith. A small boiler, of locomotive construction, holding some eight or ten gallons, was put under a steam pressure of 100 pounds to the inch, and the steam allowed to escape through some three or four small tubular openings, whereby considerable steam friction was produced. Soon after the steam commenced escaping, sparks could be drawn from any part of the boiler or iron-work connected with it, thus demonstrating the interesting fact which was first discovered through accident by Sir William Armstrong—that a steam boiler may, by proper insulation, be converted into an electrical machine.

The experiments, as well as the lecture, throughout, were eminently pleasing and instructive, and were made possible, in all their completeness, in this city, only by means of the superior character of the apparatus connected with the St. Ignatius College, which is the most complete and costly of anything of the kind elsewhere on the Pacific coast.

Prof. Neri gave another lecture, which is to be considered the second of the course of six on electricity, on Thursday evening of this week, when an entirely different series of experiments was presented.

Formation of Mountains.

Prof. LeConte has delivered two Lectures, at Corinthian Hall, in this city, on the above subject, both of which were greeted with large and appreciative audiences, and in which some rather novel theories were presented.

In his first Lecture the Professor held that there are two forces operating on the earth's surface—the sun force and the earth force. The former he assigns the leveling process of rain; to the latter the elevation of mountains and continents. This he calls the *igneous* force, seemingly admitting that heat exists near the surface of the earth, of sufficient intensity to fuse the most refractory rocks, under ordinary pressure—but not at the depths where such action is supposed to take place. If this heat increases with depth, the pressure also increases to such an extent as to prevent actual fusion, keeping still solid the substance of the interior portion of the earth, whatever that may be, even to its center. Thus we have a solid earth!

In the second Lecture, the Professor, after a brief allusion to the first, remarked that the theory of mountain chain formation is pressure. The horizontal pressure of great sedimentary districts produces an uprising. A mountain range is a great bulge in the earth's surface. After being so formed they are sculptured by igneous and aqueous agencies. He did not believe that when this uprising took place it left a hollow beneath; but that the upheaval was solid; not an upending, but an upswelling.

One of the phenomena particularly noticeable, is the falling of strata, which are very complex in their formation. These foldings are generally parallel to the mountain chains themselves, and distinctly reveal the crushing process to which the strata have been subjected. Another phenomenon noticeable, is the slate cleavings, which can not be classed as laminations or stratifications, but cleaving right through the chain without regard to the stratification, and produced by the enormous pressure, and mashing together in a plastic mass, and upheaving it. Slate is nothing more than hardened clay, and the fossils found in it, distorted and crushed, plainly indicate the

direction and amount of pressure brought to bear upon the mass.

The enormous scale upon which these mountains have been mashed is wondrous, being placed, as it were, in the jaws of a great vise and elongated as well as crushed. A mass of sediment, two miles long and 1,000 feet thick, would rise to a height of 25,000 feet, and yet we have had sediment fully 45,000 feet thick in geological eras, and it is in this manner that we can account for this great height of some of our mountain chains. Mountain ranges are no more than long lines of sediment, the Sierra being a mass of sediment 20,000 feet thick.

The lecturer closed with the startling announcement that, in his opinion, this deposit of sediment is still going on, and that in this dim distant future other mountain chains will be formed to the westward, and that volcanic eruptions will again be the order of the day, earthquakes being necessary incidents.

Professor LeConte's next lecture will be upon "The Great Lava Flood of the Northwest, and the Construction of the Cascades."

The State Legislature.

Nearly two months of the session have already passed, and nothing of the really important business which has been introduced has yet been put upon its final passage. The friends of reform and honest legislation have generally been active and vigilant; but their opponents have also been active. Finding themselves in a hopeless minority, they are employing every artifice known to the legislator to stave off important work, and, if possible, drive it so far into the session, that it will be impossible to get much of it through before the day of adjournment arrives.

The No-Fence Bill.

The no-fence bill appears to be attracting the largest share of attention just now. It is almost or quite equal in importance to the subject of irrigation. With such a law the counties most interested will have to spend nearly or quite as much money for fences as would be required to introduce a thorough system of irrigation. The bill introduced by Representative Ferguson passed the Senate a few days since, but with so many changes that it was hardly recognizable, and the Assembly did well on Monday in refusing to accept the amendments. It is to be regretted that Senator Edgerton, who has thus far made such a manly fight for the people, should go back on them in this particular, and we also regret to find San Francisco's Senator, Roach, in the same boat. The sympathy of the whole State, outside of the cattle interest, is undoubtedly with the bill substantially as it stood.

Fares and Freights.

A question of still greater magnitude, also remains to be disposed of. The latest action on the bill (Freeman's) was to postpone its further discussion in the house, until Monday next. There is little doubt but the bill will pass substantially in its present form. The Railroad company has exhausted its expedients to defeat the measure. There is an evident determination on the part of a majority of the Legislature to carry out the wants of the people, by the establishment of a scale of prices which shall protect their rights.

The bill has passed the Assembly by the strong vote of 68 to 9. The absorbing question now is—"What will the Senate do with it?" That body can scarcely afford to ignore the fully expressed wishes of the people, by either unnecessarily delaying the bill, or hampering it with such amendments as to render it of no effect.

Stop False Labeling.

In the Assembly, Jan. 26, Mr. Northcutt introduced a bill, "to prevent fraudulent sales of merchandise. It provides that all packages of merchandise shall contain the quantity represented, and that any person who shall sell any package containing a quantity less than marked thereon shall be deemed guilty of misdemeanor, the penalty to be a fine of from \$25 to \$300, or imprisonment not to exceed 150 days or both." This bill or some proper modification thereof should become a law. A large proportion of the dry and fancy goods now sold by merchants is labeled with the most outrageous mendacity. Often from one-quarter to one-half the amount labeled is minus in the package. Let California be the first to stamp her foot on this practice. Let Americans teach foreign manufacturers to label their goods with truth, or keep them at home. The taking effect of the law at once might at first inconvenience merchants; but we believe the moral lesson taught by erasing false figures upon the goods now on hand would more than compensate for the trouble. In addition to the above law, we also need one to prevent adulteration of food and other salable articles.

The Apportionment Question

Is another measure of great importance to the farmers, as under the present rate, they and their allies are fully one-half disfranchised. Fifty-five days of the session have already passed, and the unnecessary delay in considering this question is beginning to look quite suspicious.

San Benito County.

The bill to create this new county bids fair to meet with strong opposition in the

Senate. The points in its favor are being prepared for presentation to the Senate committees.

Fees of Office.

Senator Gibbons has commenced a greatly needed reform, which looks to the abolition of fees to salaried officers. Every officer shall receive a salary commensurate with his services, and that shall suffice. If fees must be taken, let it be for the benefit of the State, county or municipality. The fee system as a perquisite to officers, exerts a most vicious and pernicious influence, and should be abolished at once. The Senate has adopted a resolution to convert

The Governor's Mansion.

Which has already cost some \$50,000, into a State Armory. It would furnish a costly edifice for such a purpose; but is perhaps the best one that can be made of it unless the State can sell the property as it stands, for a fair price. It is to be hoped that we have at length reached the end of this and similar foolish extravagances. The people are tired of them.

Swamp Land Frauds.

Another astounding series of frauds connected with the swamp land grants, amounting in the aggregate to over \$200,000, is reported, which will call for a searching investigation by the Legislature. The present appears to be a bad time for public swindlers, for the metaphorical whitewash wherewith they may be coated, seems to be remarkably scarce just now. There is good reason to believe that the public money will be looked after a little closer in future than has been the case in times past. The people have got their eyes open and are determined to give no quarter to the harpies who have heretofore fattened upon them. Neither past reputation, position, nor ill-gotten wealth will shield them now.

The Irrigation Question

Seems to be slumbering just now. The only reference to it which we have noticed the past week has been the presentation of a petition by Mr. Vunables, of Los Angeles, from 1,700 practical farmers, asking for a general system of irrigation; that the State be divided into irrigation districts, and that the said districts be authorized to issue bonds for the prosecution of said work. Referred.

Riot strike reported in the lower tunnel of the Jacob Little mine.

PAIN-KILLER!

FOR OVER THIRTY YEARS

Perry Davis' Vegetable

PAIN KILLER

HAS BEEN TESTED IN EVERY VARIETY OF CLIMATE, AND BY ALMOST EVERY NATION KNOWN TO AMERICANS.

It is the constant companion and estimable friend of the missionary and the traveler, on sea and land, and no one should travel on our Lakes or Rivers without it. It has been before the public over thirty years, and probably has a better and wider reputation than any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the Pain-Killer; but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful whether used internally or externally, and it stands to-day unrivalled by all the great catalogue of family medicines. It is sufficient evidence of its virtues as a standard medicine, to know that it is now used in all parts of the world and that its sale is constantly increasing. No curative agent has had such wide spread sale or given such universal satisfaction. It is a purely vegetable compound, and perfectly safe in unskillful hands.

After thirty years trial, it is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Physicians of the first repute, and recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, &c., but for Dysentery or Cholera or any sort of Bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

Beware of all Imitations.

The Pain-Killer is sold by all respectable druggists throughout the United States and foreign countries. Prices—25 cents, 50 cents and \$1 per bottle.

PERRY, DAVIS & SON, Proprietors,
No. 136 High street, Providence, R. I.

TAKE UP YOUR LINE of march for Oritton's, No. 7 6th Avenue, all ye coughers and wheezers, and sniffers. It is the depot for Hale's Honey of Marshmallows and Tar, which for all ailments of the lungs and their air passages is an immediate and sovereign remedy. All Druggists keep it. Pike's Toothache Drops cure in 1 minute.

Roberts, 316 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine, San Francisco.

(Continued from page 70.)

lowed with an incline from the bottom of the shaft.

CHOLLAR-POTOSI.—Owing to the ore dumps being filled and the weather so stormy that it has been impossible to get the ore to the mills, but little ore has been extracted from the mine during the past week.

SUCCON.—The new shaft of the hill is down 320 feet, the sinking making excellent progress. The little shaft in the canon, east of the mill, is being sunk 100 feet deeper for the purpose of opening a new level. Drifting east and extracting ore on the line of the ledge, at the 280-ft. level in this shaft, is making steady progress.

OCCIDENTAL.—Sinking the winze in the main tunnel has been suspended till the erection of the hoisting engine. The bottom of the winze at the time of the suspension of the sinking showed some fine ore.

CALABONIA.—Raising up on the third compartment of the shaft from the 600 to the 500-ft. level, is making rapid progress.

DAYTON.—Work has been resumed in the south ore breast at the third station level. Daily yield 40 tons of ore, keeping the Woodworth mill steadily running.

ROCK ISLAND.—The north drift is in 65 ft. from the main west tunnel. Both drifts have during the past week shown decided improvement.

EMPIRE.—Sinking the north winze on the 1,700-foot level is making good progress, with much more favorable indications of finding a body of ore.

NEVADA.—The main south drift from the west tunnel is still being driven rapidly ahead, the face in good ore.

SHOHEATED ROCK ISLAND.—The work of clearing out and retimbering the tunnel is completed.

BALTIMORE CONSOLIDATED.—Sinking the main shaft is being prosecuted with all the vigor possible. Preparations for opening two new levels, one at 500, and the other at the 600-foot level, are rapidly approaching completion.

INDEPENDENT AND OMEGA.—The tunnel is cleaned out and repaired a distance of 150 feet. There is still 130 feet of tunnel to repair before reaching the ledge.

BULLION.—The north drift from the 1,700-foot station of the Imperial is in 95 feet, the rock in the face working finely.

KNICKERBOCKER.—The new hoisting machinery is all in place, and is expected to start up ready to resume operations in the mine by Thursday next.

SILVER HILL.—Sinking the shaft is making good progress. There is but little change to note of either the north or south drifts at the second station.

MINT.—Sinking the main shaft is making good headway.

FRANKLIN.—The good ore found in the American Flat mine, adjoining, is a source of great encouragement to the holders of Franklin.

DANEY.—The main shaft is down 315 feet, in fair working ground.

PICTOU.—The face of the tunnel still shows porphyry, with clay seams, and small fingers or feeders of quartz.

LADY WASHINGTON.—Sinking the shaft is making good progress, and the quartz in the bottom of the shaft never looked more promising than at the present.

TYLER.—The water in the shaft is being steadily lowered at the rate of five feet a day.

BUCKEYE.—Sinking the main incline for a new level is making rapid progress.

UTAH.—Driving the main west drift to cut the ledge, is making fair progress. There is a slight increase in the flow of water from the face, but not sufficient to impede work.

IMPERIAL.—The main east drift at the 1,900-foot station is in 35 feet, the face in good blasting ground.

NEW YORK CONSOLIDATED.—The shaft is now 450 feet in depth, the bottom in good sinking ground.

JUSTICE.—Raising up on the incline to connect with the main shaft at the 300-foot level, is making fair speed.

JACOB LITTLE.—During the week the ore vein has widened and improved considerably, showing the best next to the east wall, the face of the drift at that point showing splendid ore, rich in both gold and silver.

EUROPE.—Still drifting through the ledge, which shows improvement since our last report, assays running from \$5 to \$38 to the ton.

PHIL SHERIDAN.—The new working shaft location of this company is east of the lead, and about one hundred feet north of the Sierra Nevada Company's new shaft.

OVERMAN.—Sinking the winze from the 1,000 to connect with the 1,200 foot level is making fair progress, the bottom still in rich ore.

ARIZONA, UTAH AND GLOBE.—The main west drift on the 400-foot level still continues in hard blasting rock.

ELY DISTRICT.

WASHINGTON & CREOLE.—Record, Jan. 18: Drifting east and west from the bottom of the winzes. As far as progress has been made, have found a vein from one to two feet wide. Connection has been made between the west and prospect winzes.

PROCTOR.—Shaft down 515 feet. The old workings of this company have been let out on contract, and the work is progressing satisfactorily. Sinking rapidly in the new shaft, which is to be sunk 1,000 or 1,200 feet.

HURN AND HUNT.—Still running the main drift towards the vein, which it is expected will be cut at an early day, 1,000 feet from the surface vertically.

PAGE AND PANACA.—The indications in this mine are even more favorable than heretofore. **SILVER PEAK.**—Sinking continues as usual, and everything is working advantageously. The shaft is being sunk rapidly.

CONDOA.—Since our previous notice of this mine (two weeks ago), drifting for the ledge has progressed satisfactorily. The work continues.

INGOMAR.—Work of prospecting still continues with unabated vigor.

CAROLINE.—Shaft down 725 ft., and are putting in a station preparatory to drifting.

CHIEF EAST.—Stopping from the 221-ft. level and extracting some very good ore.

ALPS.—Still drifting, with no change worthy of mention since our last.

PEAVINE.—Stopping in the second level, and ore is being taken out daily.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS.
ALSO, MINING PARTNERSHIP LAW.
 A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish those special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & CO., Publishers, and Patent Agents, S. F.

A NEW BOOK.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, \$10.50; in leather, \$12 (currency). Forwarded by mail for 50c. extra, by

DEWEY & CO.

SHAREHOLDERS, TRUSTEES, and SECRETARIES OF ALL MINING COMPANIES.

Should see to it that their Notices are advertised legally in the **MINING AND SCIENTIFIC PRESS**, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the *M. & S. Press*, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Diamond Silver Mining Co.—Notice.

A meeting of the stockholders of the Diamond Silver Mining Company, of Tintic District, Juab County, Utah Territory, will be held on Wednesday, the 18th day of February, 1874, at one o'clock p. m., at Sherman's Building, No. 606 Montgomery street, Room 12, for the election of Trustees for the ensuing year. The subject of dividing an assessment upon the capital stock of the company will also be determined.

By direction of the Board of Trustees,
 WM. SHERMAN, President.
 O. C. MILLER, Secretary.
 San Francisco, Cal., January 12, 1874. ja-5t

Commercial Coal Mining Company, of

San Francisco. Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of December, 1873, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, room No. 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 23d day of February, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

S. B. HANSON, Secretary.
 Office, No. 402 Montgomery street, room No. 23, San Francisco, California. de20

Notice—Stockholders of the Hecker-

dorn Gold and Silver Mining Co. are requested to call at the Secretary's office and exchange their old certificates of stock for the new.

PAUL J. ROBERT, Secretary.
 Office, 620 Washington street, San Francisco.

Cupel and Tiger Silver Mining Company.

Principal place of business, San Francisco, Cal. Location of works, Wallapai Mining District, Mohave County, Arizona Territory.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of October, 1873, the several amounts set opposite the names of the respective shareholders as follows:

IS THE Cheapest and Best Hydraulic Machine in use.

The only reliable party in the Hydraulic business who protects his patrons.
9v23-4f

Address V. H. FISHER, Nevada, Cal.

HYDRAULIC MINERS, TAKE NOTICE—I hereby caution Miners and Manufacturers against making, buying, selling or using a Hydraulic Machine or Joint known as the Little Giant, manufactured and sold by R. E. & J. Craig and Richard Hoskin, as the same is an infringement upon the invention of the machine known as FISHER'S HYDRAULIC CHIEF, secured by Letters Patent, No. 110,322, dated Dec. 20, 1870. All parties participating in such infringements will be rigorously prosecuted. Nevada, Jan. 13th.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. E. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.
Dutch Flat, August 1 1873. 6v27-2m

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, with standard wheels 17 inches each, which strike 2.0 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, \$500.

G. D. CROCKER,

316 California street, San Francisco.

7725-1f **JOHN TAYLOR & CO.**

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.
The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular row between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Important to Miners and Mill Men.

These Long Stroke Pumps have large free openings and are highly esteemed for driving mines.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc. Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for Black powder.

The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

General agents, No. 210 Front Street.

VOLUME XXVIII
Number 6.

Crouch's Steam Engine.

We mentioned some months since that a youthful genius from the backwoods of Oregon had invented an improved steam engine, and that one of these engines was being constructed by Frank Huntington in this city. The inventor is about 18 years of age, not at all familiar with machinery, but shows a wonderful inventive faculty. Provisions to his invention of the steam engine referred to, young Crouch had never seen a locomotive or modern engine, but had learned all he knew about working steam from hooks and from crude experiments at his father's house. Besides inventing the engine he also experimented in other fields and soon had completed in his own imagination several very important inventions, most of which proved upon investigation to have been previously invented. This, however, should not dim the fact that they were original with Crouch, and he is entitled to as much credit for their production as if they were actually new. For instance, when living in his backwoods home he conceived the idea of constructing a telegraph that would print the dispatches as they were delivered at the end of a line, so as to avoid the use of the telegraphic alphabet. Following out this idea he stretched a wire from his father's house to the barn. He then constructed a crude battery which he connected with his telegraph line. Then he made two type wheels, one of which he placed at each end of his line, and connected with his wire so that the movement of one wheel at one end of the line would be communicated to the one at the opposite end of the line. Thus when one wheel indicated the letter A, the other wheel responded A, and so on, thus giving a complete printing telegraph almost identical with Edison's Printing Telegraph, which has been under experiment for the past few years in New York. The inventive genius of young Crouch has several times been put to the test since he came to California, and in each instance with remarkable results.

The invention to which we wish specially to refer is that of the improved steam and air engine. The principle of the engine consists in superheating ordinary steam at the instant of putting it under the piston of a steam engine, so that the full value of the power developed by superheating it will be obtained in driving the piston. To do this the inventor constructs an engine of a peculiar style which is at once compact and cheap and which can be run with very little expense for fuel. The accompanying engraving will explain in detail the principle of operation.

A is a furnace, which may be constructed of iron or masonry, and is provided with a fire place, M.B. is an upright boiler, which is mounted upon one end of the furnace, A, so that the heat and products of combustion from the furnace will pass up through the boiler and escape in the ordinary manner. Upon the opposite end of the furnace and directly over the fireplace are set two upright, open-top cylinders, C.C., so that their lower ends extend down into the fireplace through the top of the furnace. The pistons each consist of a tube of the desired length with a partition or diaphragm passing across its middle, thus forming a double cup-shaped piston, the tube serving as a guide to the moving piston. The pistons, F.F., of each piston is secured to the center of the diaphragm at its lower end, while its upper end is secured to a crank on the crank or driving shaft. The pistons move up and down in the open-topped cylinders, being connected by their pistons so that the upward movement of one forces the other down alternately.

If desired, the cylinders, C, C, can each be constructed with an inner tube, which is smaller than the cylinder and inside of which the piston moves. In this case the space between the upper end of the cylinder and the tube will be closed and the tube will not extend quite to the bottom of the cylinder, thus providing a space or jacket between the two, which communicates, below the tube, with the space below the piston. Suitable packing is secured around the pistons, in order to render them steam-tight in the cylinders.

The inventor provides a tube which connects the jacket of the cylinder with the open air, and which is provided with a proper valve.

The inventor claims that at each upward stroke of the piston, a quantity of air is drawn through this tube into the jacket, and serves by expansion to aid in the subsequent stroke of the piston. This tube, however, can be used or not as desired; the improvement in working steam is not dependent upon it further than its use as an auxiliary.

R is the steam chest into which the steam is conveyed from the boiler by the pipe, S, and T is the exhaust pipe. The steam valve is operated by a crank, U, connecting link, V, and eccentric, W, from the main driving shaft. The fire which heats the water in the boiler, also heats that portion of the cylinders, C, C, which extends down into the fireplace, and when thus heated, the steam, which is admitted below the pistons, is suddenly superheated by coming in contact with these heated chambers, and its power is greatly multiplied at the very instant and in the exact situation in which it will work effectively.

Superheated steam has been used before this

CROUCH'S STEAM ENGINE.

invention, in steam cylinders, but it has always been superheated in an intermediate heater between the boiler and engine, and introduced into the cylinder in a highly heated condition, while the cylinder was at a much lower temperature; and while much better results have been obtained in this way than by using steam at ordinary temperatures, the condition was such that the cylinder and piston were soon destroyed by the action of the superheated steam. By the invention of this young man the cylinders themselves are kept at the highest temperature and made to serve as superheaters as well as cylinders, giving the additional advantage of utilizing the explosion or sudden expansion caused by superheating at the instant the expansion occurs. In the present case an ordinary slide valve is used for working the steam, but it is manifest that any of the known methods of admitting steam and cutting off at different parts of the stroke may be employed, as may be found most suitable for the style of engine to be used. Several of these engines have already been constructed and are in operation, working very well. Those who have experimented with them say that there is a great saving of fuel and that the power developed by the engine is greater than would be due to an engine of similar size working with ordinary steam.

MORE COAL.—The Oakland News says: Every now and then some one finds a "valuable coal ledge" in this county, but we never see any wagons coming in loaded from the mines. The Haywood Advocate chronicles the latest discovery, and this time it is near Corral Hollow, about eight miles from Haywood.

SIEBERT'S LUBRICATORS.—Weed & Kingwell of the California Press Works in this city, agents of Siebert's Lubricators, are now shipping them to Boston, Mass., Port Huron, Mich., and other places in the East, to fill bona fide orders.

Protection to Stockholders.

Mr. Quinin has introduced, at the Legislature, a bill to provide for the better protection of stockholders of incorporated companies. It provides that the owner or owners of \$1,000 per value of stock in any company incorporated under the laws of this State may apply, and must be granted permission by the Board of Trustees, for permission to enter upon and examine the property of the company, both on the surface and under the ground. Every demand, neglect and refusal to grant the permission shall be punished for contempt by a fine of \$200. A demand of the President shall be deemed a demand on the Board, after giving ten days' notice. Justices' Courts have jurisdiction. This bill is a good one, and ought to pass. At the same time we must confess that, as all of the mines are some distance from this

Holcomb Valley District.

We were shown this week by Mr. G. W. Perrie some handsome specimens of gold-bearing quartz from the mammoth ledge in Holcomb Valley District, San Bernardino county. Mr. Perrie has lately returned from the district and gives quite a flattering account of its richness. He thinks there is a good field for prospecting in that part of the country both for placers and quartz. The district embraces a tract about 20 miles in diameter. It comprises both Holcomb and Bear valleys. Being on the summit of the mountains there is an abundance of wood, and the creeks and springs supply all the water required for steam milling operations. Bear valley is 6,650 feet above sea level, and Holcomb valley is 7,250 feet. Both valleys are embraced in the one mining district at present, though they will eventually be separated into two districts.

At present the fare from here to the mines is quite low. It costs from here to San Pedro by steamer, \$3; from San Pedro to Los Angeles by rail, \$2.50; from Los Angeles to San Bernardino \$5 by stage. The distance by stage from San Bernardino to the summit of Cajon Pass is 25½ miles; from there to Holcomb valley is 40 miles. This is the distance by the proposed toll road, but by the present route it is about 80 miles altogether from San Bernardino to the mines. Supplies are now packed in by the trail which the new toll road will follow, and which is a road that can be easily traveled in the winter as the grades are quite easy. The present route taken by the stage is over an old and rough road which is quite circuitous and hilly.

The placer mines in Holcomb valley proper have been worked since 1860. There is very little wash, the gold having all come from ledges near by. Men have also been working for some time on narrow but very rich "stringers," which have paid well. There is one quartz mill in the valley, but placer mining is principally carried on there. The ledges in Bear valley are very large. One ledge is a vein about 60 ft. wide and crops out for over 2½ miles from 10 to 60 feet high. No work of any consequence is being done anywhere on this ledge, except upon the property of the Bear River Gold Mining Co., a location owned by E. J. Beldwin, Samuel T. Curtis and others. They are now running a tunnel in parallel with the vein at a place where the mountain breaks off into the valley. They intend to cross-cut in on to the vein; this tunnel is in now about 100 feet. Their property comprises two claims—the Moonlight and Rainbow—of 1,500 feet each, and the company is an incorporated one. Some work has also been done on the Mexican and Morris claims, but on few of the others in the district except those mentioned.

It is reported that a 50-stamp mill will soon be erected on the Bear Valley Company's property. They are now at work and in the spring will extend their operations. The rock carries principally gold, but quite a large percentage of silver is also obtained. The foot wall of the ledge is slate, and the hanging wall quartzite and porphyry. An "expert," who lately visited the property, estimates that there are \$15,000,000 on top of the ground, from the croppings alone. The ledge is pronounced by him as one of the largest of fissure veins. The Bowling Green and Archie mines are on a ledge lying about half a mile north of this property. No work has been done on them except to prospect them a little. The ore is quite rich, and the ledges will soon be worked. The placer diggings near by have paid very well.

CONSOLIDATED REFORMA.—We have seen at the office of the company, 605 Clay street, some ore from the Consolidated Reforma Lead and Silver Mining Company's property, in Lower California, and also a certificate of assay, showing that the ore carries \$263 in silver per ton, and 25 per cent. lead. The first samples of ore that were shipped to this city assayed \$28 in silver and 68 per cent. lead, from which it will be noticed that as sinking continues the rock grows richer in silver and poorer in lead. They have lately sent 15,000 feet of lumber to the mine for tunneling purposes, and 2,300 ore-cars to transport ore, so that they soon expect a shipment from the mine to arrive here.

UTAH SILVER LEAD.—At the Utah Silver Lead (Limited) of Bingham Cañon, Utah, the concentration works are now completed. They consist of six continuous self-feeding and self-discharging jiggers, several boulders, one Blake stone breaker, one pair of Cornish roller crushers, sizing apparatus, etc. They can run through 100 tons of ore per day and produce 25 tons of concentrated ore of 75 to 80 per cent. lead and 20 to 25 ounces of silver. The capacity will be increased to 150 tons per day. Some 2,000 tons of ore are on the dump and about 20,000 in the mine as reserves.

Trinity County Mines.

A correspondent of the *Bulletin* writes an interesting letter from Weaverville, Trinity county, from which we take the following:

The mining to be carried on here is chiefly hydraulic, and it may safely be affirmed that in no other portion of the State are water, gravel, outlet, pressure and all the other factors of a large and profitable production, present to such an extent as here in this county. The soundness of this position will become manifest, if we examine a little into the past history and present condition of things in Trinity.

A New Era with an Infusion of New Enterprise.

A year or two since a number of hydraulic miners, old residents of Placer and Nevada counties, learning of the good openings presented here for that style of washing, came up to Trinity, and, having looked about and become satisfied with the appearance of things, proceeded to obtain interests by purchase and location in mining grounds, water-rights, etc., several of them taking up their abode here. These men, with their greater experience and more advanced ideas, were not long in introducing the improved apparatus and modes of operating to which they had been accustomed; and to such an extent has the use of these since obtained that the production of gold dust has already been sensibly increased, and every description of mining properties much enhanced in value. To illustrate this point more fully, it may be stated that eighteen months ago the style of nozzle known as the Little Giant, by far the most effective in use, had not yet made its appearance here; the old-fashioned pipe and very often the canvas hose being still employed, while much of the hydraulic washing done consisted simply of ground sluicing. Now there are over forty of these implements at work in the county, and the number will be more than doubled the present season. Until recently, the under-current, the most complete gold-saving device yet operated in connection with hydraulic washing, was a stranger here, while the use of quicksilver was almost unknown, not a hundred flasks having as yet ever been consumed in the county. The non-employment of these new aids and inventions, elsewhere deemed indispensable to success, was due not so much to an ignorance of their existence or any great obstacle in the way of their earlier introduction, as to the fact that the miners here were able to realize good wages without recourse to this class of auxiliaries. In the deep benches, along the rivers and in the deep banks of hydraulic gravel, all found good-paying diggings, after the deposits on the low bare and along the gulches had been exhausted. Here the entire population, aided only by the crude methods and appliances of the earlier day have been able to earn much higher wages than the average throughout the other mining districts of the State. For the same reason the construction of more and larger ditches, as well as other works designed to facilitate mining operations, have been neglected.

But all this is about to be changed; with the advent of more experienced and energetic miners, new implements and apparatus have been brought into use, and new enterprises set on foot. The neglected water franchises, including reservoir sites, lakes and running streams, have been taken up and secured. Thousands of acres of auriferous gravel have been located, and much of it patented. Ditches of extreme large capacity have been projected, surveyed, and in some cases graded and partially excavated. Prospecting shafts have been sunk, roads have been built, and within a single year more than 40,000 feet of heavy iron pipe have been laid down, the whole of this advance having been accomplished in less than one year and a half. And yet the era of progression has but just commenced. For many years to come preliminary work must be active here.

Trinity as a Mining County.

Her beds of auriferous gravel are deep, rich and extensive, and free alike from overlying masses of volcanic matter and strata of barren sand and clay. So far as explored, there is here an absence of that cemented material requiring gunpowder to break it up; nor have any of those high side rims, necessitating the construction of long bed-rock tunnels, been encountered. These gravel ranges are everywhere cut at short intervals by deep ravines, through which flow large and rapid streams, fed by the perpetual snows that cover the mountains in which they have their sources. These ravines supply to almost every claim a good working face and at the same time ample fall and outlet for the escape of tailings. The water-supplying mountains stand so immediately over the gravel belts, that short and inexpensive ditches suffice to bring it upon the ground to be washed, delivering it generally under a greater head than can with safety or advantage be fully availed of. These hydrostatic conditions will be better understood with a word in explanation of

Topographic Features

With the peculiar system of mountains, gulches, lakes and streams. A glance at the map of this region shows us the main Trinity river entering the county at its northeast corner, whence it flows south, bearing a little to the west, till it has nearly reached the further edge of the gold bearing lands, when it curves around and running towards the northwest, passes out of the county at its extreme angle in that direction. This river, besides a great number of other tributaries, some of them large streams,

has a main north and south fork, also fed by many confluent. The aggregate volume of water flowing through these streams is variable, being very great when swollen by the rains and the melting of the snow, and shrinking to comparatively small dimensions during the fall and early winter. The Trinity, below its principal forks, carries about as much water as the Stanislaus or Tuolumne. Having but little fall, the main stream flows with a moderate current. Its tributaries, however, are all very rapid, some of them having an average descent of more than 200 feet to the mile. All the forks and larger branches of this river are separated from each other by mountain ridges, their lower slopes composed of slates covered with auriferous gravel, their upper portions consisting wholly of granite. These ridges are lofty, some of them reaching an altitude of more than 8,000 feet. Their upper slopes are precipitous—often mere cliffs of bleached and naked granite. As a general thing, however, they are timbered almost to the top. Their sides are deeply eroded with cañons, which, becoming the receptacles of the drifted snow, hold the water in reserve until late in the summer. At a number of points these mountains spread out into plateaus or basins near their summits. In these depressions occur little lakes, all very deep, and some of them covering several hundred acres. In these lakes many of the larger streams take their rise, and such of them as are suited to the purpose have been secured for reservoirs. By damming up their outlets, which can be done at small expense, their capacities can be increased many fold, insuring steady water to the ditches fed by them nearly the year round. With these bountiful sources of water supply, and with the gold-bearing material so prolific, plentiful and favorably situated, we have here the conditions for a large and general success in this branch of mining. Even the most extended ditches will not require to be more than thirty-five or forty miles in length, while in most cases they will need to be not more than half that long. Of the ditches constructed there is scarcely one having a linear extent of twenty-five miles, the majority of them ranging from three to ten miles in length, with water-carrying capacities proportionally restricted.

Character of the Gold-Bearing Deposits.

Overlooking the quartz, with which not much has been attempted, and still less done, the auriferous deposits which now constitute the principal field of gold-seeking labor here, consist of three classes: The mountain gulches, the benches and higher bars along the rivers, and the banks, or rather hills of gravel lying further back between the larger streams and the mountains. The first of these, as before remarked, have come to be pretty well exhausted; the second, which yields a large proportion of the gold now gathered, is rich and easily worked, the gravel varying from twenty to sixty feet in depth, being loose, free from large boulders, and readily run off. Sometimes the water here, used for washing, is raised by means of wheels placed in the river and turned by the currents. Oftener, however, it is brought from the adjacent mountain ravines through small ditches, the bed being always feeble and the supply usually running low before midsummer. These benches are very extensive, reaching along the main river for miles at a stretch, sometimes two or three tiers high, and will afford profitable mining for a great many years. With the exception of getting on water, they are attended with but little expense or trouble. The tailings are run into the river, where the accumulations of the season before are swept away with each recurring stage of high water, preventing thereby any permanent collection of waste matter at the discharging end of the sluices. In the third class of deposits, however, the large and enduring wealth of Trinity rests, and it is these that will give to this county prominence as a hydraulic region over every other in the State. Nowhere else has such a depth of pay gravel been met with as here. In the central and more southerly counties beds having a thickness of two or three hundred feet are considered remarkable. At all the great hydraulic centres of Placer, Yuba and Nevada counties, the average depth is considerably short of two hundred feet. While this is much less than the ascertained thickness of the deposits of many points here, they reach in other localities a supposed depth of six or eight hundred feet, there being places where the absence of bed rock in the intersecting cañone would seem to indicate a still greater depth than this. Along the easterly base of the mountains that separate the North Fork from the main Trinity the cañons cut the gravel ranges to a depth of 1,500 feet without anywhere disclosing along their sides the bed rock; numerous shafts sunk on the ridges above to the depth of several hundred feet having alike failed to reveal any signs of its presence there.

Another Remarkable Feature

Of these deposits, consists, as above stated, in their entire freedom from volcanic flows, ashes or other igneous matter, such as has frequently elsewhere rendered the working of the gravel exceedingly troublesome, and very often wholly impracticable. In the absence here of pipe-clay and sand, the former a difficult stuff to get rid of, and both barren of gold—the miner is relieved of another source of perplexity and hindrance. When it comes to be run off to a lower level than has yet been reached, it is possible that the gravel here will occur in a more indurated or cemented form; though as yet nothing so impacted has been encountered as to require the use of powder to break it up.

So, also, it may come to pass, when washing has been extended to much greater depths than the rim-rock formation will present itself, making the construction of bed-rock tunnels a necessity. As yet, these rocky sides of the old river channels have nowhere been reached.

Still Another Peculiarity,

Of the deep gravel banks here, remains to be noted: so far as explored, they pay all the way down, and invariably improve with depth attained. In all the shafts sunk and pits washed out, no wholly barren strata have been intersected or exposed. A good "prospect" can be obtained everywhere, even upon the surface. A pan of gravel taken from the tops of the hills never fails to give the "color." Vertically measured, every inch in the shafts sunk shows gold—always a number, and sometimes many hundred small particles to the pan. The showing made almost anywhere on top of the ground here would be considered a fair shaft "prospect" in most of the old districts, while the dirt removed at considerable depths is often rich enough to pay for drifting.

Little Work and Large Pay.

Only along the deeper ravines and at the few points where they about on the rivers and larger rivers have these high gravel ranges been much worked. Wherever washing has been done, however, the returns have been liberal and often very large, despite the careless modes of conducting it and the imperfect style of apparatus employed. It is notorious that the miners in this county have not of late years worked more than one-half their time. Few of them, unless engaged in wing damming or river fluming ever calculate to do anything through the fall and early winter. Only while the water lasts, and that, with their few and inferior ditches, is not long, do they think of making any serious exertions. So generously do their claims pay that the most of them are enabled to earn enough during this period to carry them through the year, and generally leave a handsome surplus besides. As already observed, they have not been in the habit of using either quicksilver, the under-current or any other means for saving the fine gold, which, having been suffered to go off with the tailings, has reduced their earnings considerably below what, with the observance of a little more economy and thrift, they might have been. But all this, under the new order of things about being inaugurated, is likely to meet with early correction.

Mining Properties and Franchises.

Most of the miners here own several small claims, and some of them large tracts of mining ground, often with ditches and water franchises appurtenant. The most of these are held on speculation or for sale, and as compared with prices elsewhere, the figures set upon them are not extravagant. Indeed some good bargain might be negotiated here at present, the parties in ownership being old residents who would rather sell out and leave the country than hold on to claims that they have neither the inclination nor means to put in good shape for production, yet notwithstanding their desire to sell they are constantly advancing the prices of their properties, knowing that they are every year becoming more valuable. For example, the proprietor of the McGillivray Ranch and mines lying on the river 15 miles below this place, was anxious to sell the same a little over one year ago for \$50,000. Last summer he bonded it to Postmaster Stone, of San Francisco, and his associates for \$100,000. Failing to dispose of it to these parties, he has since advanced the price to \$125,000, and there is every likelihood that they will want \$150,000 before the season is over, as he expects to net a clean profit of \$50,000 from it during the next six months. This is a splendid property, embracing an extensive area of the terraced bars along the river, rich in gold; a large ditch with valuable water franchise and several hundred acres of land, a large portion of it alluvial bottoms, highly improved, and covered with trees bearing the choicest varieties of fruits, and in such abundance that thousands of bushels of apples and pears are left ungathered, though of a quality superior to any ever seen in the San Francisco market. Apart from its value for mining and agricultural purposes, this is one of the most charming spots in the State, and it is little likely that the owner would care to sell or leave it, were it not that he has already made a good deal of money and is desirous of removing with his large and youthful family to some place where they can enjoy better opportunities for acquiring an education.

But there are others equally as good and, if large future production be consulted, even better things on the market here than the McGillivray estate; thus, we have the Atkins and Lowden property, consisting of a capacious system of reservoirs and a twenty-mile ditch having a six-thousand-inch capacity and water enough to keep it filled the most of the year; this work being surveyed, nearly all graded, and a portion of it constructed. It is in the hands of live men who will push it ahead as rapidly as their means will admit of. They will sell a part of it, using the proceeds of the sale to finish the work, they still retaining an interest, or they will sell the whole, applying the money thus realized for the construction of another large ditch, projected and under way for bringing the waters of Cañon creek and the North Fork and its tributaries upon Oregon Divide, and the benches along the main Trinity—a group of lakes lying under Mount "Bally," and other tall peaks being used as feeders. These are both important enterprises and will command a large success when completed.

The Loveridge Canal, a bold and costly scheme, contemplating the conveyance of a

large volume of water across a mountain gorge more than a thousand feet deep, by means of depressed iron pipes, ranks among the other great and useful projects of Trinity. The Davidson Flume, the largest and longest structure of the kind in the State, is another work of much local interest here. This flume has for its object the running off of the water and tailings from the Weaver Basin, and will greatly benefit a large community of miners, besides enriching the owners, should it result in the final accomplishment of the end proposed. In the above we have some of the more prominent enterprises undertaken for furthering the mining interest in this section of country, there being many others looking to the same end and projected, as well as others of minor importance already well advanced towards completion.

COPPER.—The *Virginia Chronicle* has the following: An examination of the ore brought in by William H. Nalleigh and inquiry into the geological features of the country about the copper mine recently re-located by that gentleman, convince us that the discovery is one of far more importance than we at first supposed. Samples of the ore are now in the hands of assayers in this city. The mine was located by Mr. Nalleigh ten or eleven years ago, and an incline shaft sunk to the depth of twenty feet in the croppings, but the claim was subsequently abandoned. Assays of the croppings at that time showed thirty-six per cent. copper and \$11 to the ton in silver, and an assay made yesterday to determine the percentage of copper, only, gave the same result. Samples now in the hands of assayers will determine the quantity per ton of gold and silver. We yesterday examined carefully the ore brought in by Mr. Nalleigh on Wednesday last, and found it to contain pure native copper, green carbonate of copper, golden sulphuret of copper, red oxide of copper, peacock ore, malachite or native carbonate of copper, and in the wall rock traces of gold, silver and crystallized galena. The re-location was made by the Queen of the West Copper Mining Company of this city, 1,500 feet of the ledge being located under the law of Congress. The ledge is five feet wide, crops indistinctly for 200 feet, with a north and south trend and eastern dip, and is enclosed in a country rock of syenitic granite of compact structure. It is situated seven miles from Mason Valley, in the range of mountains north-west of the main branch of Walker river, eight miles from wood and water, and seven miles due south from the rich copper mine of Carter & Ludwig, which has proved a fortune to its owners. It is in Lyon county, near the Esmeralda line, convenient to Carson, Dayton and Wadsworth, and is approached by a good natural road. The work of opening the mine will be commenced and vigorously prosecuted as soon as the weather will permit.

SILVER.—The area of country productive in silver ores is increasing very rapidly the world over, and especially in the United States. It is not more than five years since Utah was proved to be rich in that metal and not more than seven since its first discovery in any quantity in Colorado. Less than three years ago the discovery of distinct argentiferous veins along the north shore of Lake Superior took place, including the lodes upon Silver and Jarvis Islands, and a number upon the main land. These veins are proving extraordinarily rich as may be seen by the bulion product of the Wyandotte Reduction Works. These works turned out from June 1st to Nov. 25th \$403,000 in silver, three-quarters of which amount was from ore taken from the Silver Islet mine. Within the last year a large number of silver veins have been found in the northern peninsula of Michigan upon the south shore of Lake Superior, the ore from which is coming gradually into market, and proving of excellent grade. It is only a few years since Colorado was considered exclusively a gold bearing country. Now the area of territory productive of that metal is not over 350 square miles, against over 2,000 known to be rich in silver deposits.—*Mining Review.*

LOWER CALIFORNIA MINES.—A correspondent of the *Alta* writes as follows from La Paz, Lower California: "The mining interests are as prosperous as can be expected, considering that of the hundreds, and probably thousands, of leads known to exist in the Territory, scarcely a dozen have ever been touched. The three or four that have been opened are already yielding a profit. The newly discovered region above Mulege, where is located the property of the company, called, I believe, the Reforma, is attracting considerable attention. All the indications are that it is very rich, and has the merit of being virgin in its newness. Albeit, it is said here by some of the old Mexicans that the immense quantities of gold and silver found by the Jesuit Fathers, and used in part to embellish the numerous churches established by them in that region more than a century ago, were taken from that section. That the old Jesuits of the Territory devoted much of their time to mining, is sufficiently proven; and that beside the immense wealth of silver and gold used by them in embellishing their church edifices—evidence of which still exist—they made large shipments of their treasures to Spain.

The velocity of a very light breeze is 5 miles an hour; of a gentle breeze, 10 miles; moderate breeze, 15 miles; fresh breeze, 20 miles; strong breeze, 25 miles; moderate gale, 30 miles; fresh gale, 45 miles; strong gale, 50 miles; heavy gale, 70 miles; storm, 80 miles; hurricane 100 miles and upwards.

SCIENTIFIC PROGRESS.

Enameling Paint.

One of the most recent inventions for painting or coating surfaces is a new paint brought out by Mr. Griffiths of Liverpool; which has, according to the *Furniture Gazette*, the property of forming a firm, impenetrable enamel on the surface of the article to which it is applied. By this means, the surface is rendered absolutely water-proof, however porous it may be. The material is consequently intended, not only for decorative purposes, but to be applied as a water-proof coating to the walls or foundations of dwelling-houses, railway arches, bridges, tunnels, viaducts, and other structures of brick, plaster, wood or iron. It is also stated that the paint is well adapted for covering the bottoms of vessels, or submerged structures of any description. Various trials have at different times been made of it. At Portobello it was tried on some iron plates, and these were immersed for three months in sea-water. At the expiration of that time the plates were taken up and examined, when it was found that they looked fresh and clean as ever, and quite free from seaweed; and, on some of the enamel being scraped off, the metal showed no signs of rust, although similar plates, treated with other kinds of paint, and immersed in the same way, were both foul and greatly oxidized. As a second test, some of this paint was applied to the steamers trading to Africa from Liverpool, and these also showed no signs of corrosion on their return. It is also said that its smooth surface gives it considerable sanitary value, and for this reason, as well as that it defies the attacks of white ants, the huts used for the soldiers in the Ashantee expedition are to be coated with it. The walls of the huts, which the paint will make smooth, and polished like glass, can be washed with soap and water, or disinfecting fluid. This enamel is also available for painting the walls of hospitals, fever wards, etc., as the porosity of the plaster is entirely stopped, thus preventing infection from lodging. It can be made of any color. White and chocolate are generally used. Various processes for the preservation of ships' bottoms from fouling have, from time to time, been brought before the public, and the patents on the subject are very numerous. The earliest of these was taken out in 1695, (No. 341), by Charles Ardesoif, for "A new invented composition, which will preserve ships from the worms, inasmuch that any ship may, by virtue of the same, continue at sea for four or five years without receiving any damage from the worms." Since that time very various methods have been employed, with greater or less success. The chief merit claimed by Mr. Griffiths for his invention, is that of simplicity of application, as it is simply spread on with a brush, like common paint, and sets quite firm in about an hour, even on wet surfaces.

Such descriptions are certainly very inviting, but we confess, that by dint of constant reiteration, and breaking of similar promises, usually made by interested parties, we have become somewhat skeptical. We are not told what is the composition of the new paint—we presume it to be an adaptation of slate dust, or of soluble glass—these have both been long used, and in many cases with good results. But Mr. Griffiths' paint is entirely too good.

TEMPERING STEEL AND REGENERATING BURNED IRON.—M. H. Caron says: A piece of steel is generally tempered, and then reheated more or less according to the hardness and the elasticity which it requires to receive. The dry temper, commonly practiced, that is to say, plunging the red-hot metal into cold water, has the drawback of developing cracks and crevices injurious to its tenacity. Reheating does not remove these flaws; and subsequently, on use, these fissures, though invisible at first, increase and terminate in fractures. It has already been discovered that, in order to escape danger, it is preferable to temper the steel a little softer and afterwards to reheat more slightly. The author has succeeded in producing the combined effects of temper and reheating in one operation, and of removing as far as possible the chances of flaws. This is done by heating the water, into which the red-hot metal is plunged, to 55°. Tempering in hot, or even boiling, water, modifies soft steel containing from two to four thousandths of carbon. This process augments its tenacity and elasticity without sensibly altering its softness. The texture is changed and becomes fibrous, even if previously crystalline. The method for restoring burned metal is likewise to plunge it at a red heat into a hot liquid.

AMMONIO SULPHATE.—L. L. Hote proposes to utilize refuse wool, horn, feathers, and other nitrogenous bodies by digesting them with a dilute solution of caustic soda, 1 part soda to 10 of water, until they have assumed a pasty consistency. The mass is then mixed with quicklime and distilled, at first at a low heat and afterwards at a full red. The vapors are condensed in chamber acid. The residuum in the retort is carbonate of soda and quicklime. By boiling this with water the soda is recovered as caustic soda, and is ready for the next operation.

ACTION OF DILUTE SOLUTIONS OF SALTS ON LUMEN.—The following points, made by P. Muir, will be found of interest, in sequence to articles lately published by us in relation to purity of drinking water, etc.:

1. A nitrate, and particularly ammonium nitrate, increases the solvent power of water for lead more than any other salt experimented with.
2. Small quantities of nitrates seem to increase this solvent power nearly as much as larger quantities. A litre of water containing .02 grm. of a nitrate, was found to dissolve nearly as much lead in a given time as double the quantity of salt.
3. Chlorides, at least calcium chloride, do not increase, but rather diminish the action of water on lead, and that, too, when the water contains a nitrate.
4. Carbonates diminish the action of water on lead more than other salts. One part of potassium carbonate in three thousand parts of water will prevent almost entirely the action of water on lead.
5. Sulphates behave like carbonates, though they are not quite as effectual in their action as carbonates.
6. Water containing a nitrate, and at the same time a carbonate and a sulphate, will have but little, if any, action on lead.

FOCAL DIFFERENCES IN THE EYES.—A writer in *Science Gossip* speaks of the difficulty which some persons experience in the use of binocular microscopes, owing to a focal difference in the eyes. In a case mentioned one eye was far-sighted, while the other was near-sighted. For reading purposes, this person wears a pair of spectacles in which the one glass is made for the far sight, while the other is a plain glass, the left eye being near-sighted, and consequently requiring no aid from spectacles with which to read. Instances are cited of persons who, while employing both eyes for ordinary vision, usually employ only one in reading. If any difference of the kind exists between the visual power of a pair of eyes, it may be readily detected. Hold up a piece of card before one eye, so as to cut off its field of view, and then look at some object before you with the other. Then gradually bring the card before the other eye, and view the same object. If the object is seen with the same distinctness in each case, then your eyes are perfect as regards the balance of their foci; if not, then there is focal difference more or less decided. It would no doubt be advisable to take account of this very frequent difference of foci, in selecting a pair of spectacles.

ANALYTICAL PROGRESS.—In search of a method of determining the elements of organic substances by a single combustion, Mitscherlich has recently discovered a new mode by which, by direct analysis, not only the carbon, oxygen and hydrogen in an organic substance can be determined, but also the chlorine, bromine, sulphur, iodine, phosphorus, and probably also the nitrogen therein contained. The organic material is brought to combustion with oxide of mercury, the results of which process are water, carbonic acid and mercury. The two former are weighed in the ordinary manner. The weight of the mercury formed serves to determine the quantity of oxygen due to combustion, by subtracting which from that contained in the carbonic acid and the water, the total amount of oxygen existing in the substance submitted to elementary analysis is found. If, however, the body under examination contains chlorine, bromine, or iodine, these elements combine with the mercury set free, and are determined by weighing. Sulphur and phosphorus combine in the state of sulphate and phosphate of oxide of mercury.

ZINC SMELTING.—By a new process, the ore, mixed with carbonaceous powder, is placed in a heated oven situated over a furnace charged with coke or other carbonaceous matter. This furnace is supplied with air preferably heated in such limited quantity as to generate carbonic oxide, which is led hot through the oven above. The ore is thus reduced, and zinc vapor is carried by the gases through exposed passages, wherein it is condensed and from the bottoms of which liquid zinc flows. The condensation of the zinc is aided by keeping the gases under pressure, which is effected by forcing air into the generating furnace and making the gases, at their final escape, pass a loaded valve. In escaping, the gases bubble through water, whereby any portions of zinc vapor are condensed, and they may then be led to a boiler or other furnace, where such combustible ingredients as they may contain are utilized as fuel.

SEPARATION OF ZINC, COBALT AND NICKEL.—We find the following method given in *Iron*: The three metals are brought into the shape of chlorides and then mixed with ammoniac chloride, evaporated to dryness, and then gently ignited. The chloride of zinc will be volatilized. The nickel and cobalt may then be separated by means of potassic nitrite in the usual manner.

EFFECT OF ELECTRICITY ON HEATED STEEL.—MM. Treve and Chedeville find that if a current of electricity traverses a coil of wire that surrounds a cooling ingot of cast steel, the steel, when perfectly cold, shows on fracture a finer grain than when the current is not passed. The magnetized steel also had less power of resisting forces of extension and compression.

MECHANICAL PROGRESS.

A New Type-Setting Machine.

The art of printing by machinery has advanced with very rapid strides during the last twenty years; so quickly, indeed, that the variety of machines at present in use is scarcely known even to printers' engineers. But this only applies to the printing-press department, or that division of the trade which impresses the types on the paper after they have been put together into pages and locked in an iron frame termed a "chase."

Strange to say, notwithstanding all these improvements in the printing-off of the "formes" of type, the art of the compositor—the man who puts the type together—has been left where it was above two centuries ago. But this has not arisen either from oversight or from a belief that the art had arrived at perfection, but from the innumerable difficulties which attend the application of machinery to composing. For fifty years failure has followed the footsteps of inventors, notwithstanding their partial success, mainly of late years, because the advantage gained by machinery over men was too small to pay for repairs and return a decent interest on the original cost of the machine.

The earliest of these machines was that produced by Dr. Church just fifty years ago, the latest before the general public was that shown at work in the Exhibition of 1872, and which it was remarked by strangers to the art of printing was constantly getting out of order. In next year's Exhibition, however, we hope to see a new one which will find more favor with master printers than its predecessors, as it is constructed on an entirely original plan, and cannot easily be deranged, or if deranged by a vice, can be put in order in a few seconds. The machine has not yet been patented, but we have been favored with a sight of it at work, when it gave very satisfactory results.

This machine is the invention of Mr. J. Hooker, a compositor and self-taught mechanic, who has had considerable experience in the working of type setting and distributing machines, and consequently has had a capital opportunity of testing their value and observing their defects. Besides the above, the inventor is now constructing his sister machine—a distributor—without which the art of composing is not considered complete; but at the time of our visit, this machine was so little advanced that we could not test its value or detect its defects.

The composing machine can be worked singly—that is, by one man—but the inventor tells us that it is most economically worked by three men and a boy, who can produce work equal to that of twelve compositors, and with many less errors, which we believe is in the limit of its power, as we tested the speed and worked it ourselves. The inventor has been over ten years working on his ideas, and has during that time twice abandoned a partly completed machine for improved ones on new principles. He has studied every English patent, and has done wisely in constructing a perfect machine instead of patenting a model, which can never show whether an invention can be peculiarly successful or not. For his sake, and as a boon to the newspaper and reading public, we wish him every success.—*Iron*.

A NOVEL BURGLAR DETECTOR.—The *Montreal Gazette* recently informed us that "the profession of burglary, at all times a hazardous pursuit, is likely to become still more dangerous to its followers in the future—thanks to an ingenious invention which was privately exhibited at the Mechanics' Hall. We allude to Simpson's 'Excelsior Burglar Detector,' which is an apparatus of great simplicity, and one which will no doubt answer all the purposes for which it is designed. It consists of a small cast-iron block, having four chambers drilled in the surface, communication between which is managed by a fuse hole running from the bottom of the fourth to the first hole. These holes are charged with powder, ordinary gun wadding being used, and exploded by means of a strong hammer spring, which, being connected with wires to any part requiring protection, is brought down on the nipple by the slightest touch of the wire. The first chamber is thus exploded, and after an elapse of a few seconds the other chambers explode in succession, owing to the fuse at the bottom, giving an alarm loud enough to awaken Rip Van Winkle or put a regiment of burglars to flight. As many connecting wires can be used as suit the owner's fancy, and if he is inclined to inflict punishment upon the intruders, all that is necessary is to have the chambers loaded with ball, with the muzzles pointed in the direction from whence he anticipates a visit. The apparatus is certainly a very useful and effective one, and must be extensively used by those householders who desire to protect their property from burglars."

APPLICATION OF THE SAND-BLAST.—The most recent application of the sand-blast is for cleaning the fronts of buildings by removing the soot, dust, and other substances therefrom. The impact of the sand on the surface removes the soot or dust from all the crevices and indentations, without perceptibly interfering with the sharpness of the architectural ornamentation.—*Jour. Soc. Arts*.

SINGLE-RAIL RAILWAY.—In a late issue we described a novel plan, recently put in operation in Georgia, by which locomotive and cars would require only a single rail. An English exchange thus comments on it: As the railway develops, its proportions contract. The wide gauge of six and seven feet has dwindled by turns to the narrow gauge of 4ft. 8 in., to the meter gauge of 39½ in., to the *Isle of Man* gauge of three feet, to the talked-about 33 inch, and to the really executed two-foot Festiniog. The last-mentioned narrow gauges have been completely outdone by the "prismoid, or one-track railway," recently constructed at Atlanta, Georgia. This is built up of several thicknesses of plank and is said to resemble the "inverted keel of a vessel with a flat rail on the apex." A railway track of this kind can be built at the cost of three thousand dollars per mile. The engine is a four-ton locomotive, or steam bicycle, which is fitted with flanges on the outside of each wheel, locking, it is said, the rolling stock to the prism. This is probably very well suited for a street railroad in Atlanta, or any other fastly-named place that is not in a hurry. No doubt it would run, after a fashion, but the difference in the amount of friction incurred by the various parts of the broad flange would alone disqualify the invention from any claim to practical utility. Something prismoidal was, if we mistake not, tried on the Semmering some years ago, with the view of surmounting the difficulties of a steep gradient, but was abandoned on account of unequal friction. No high rate of speed can be obtained by "fancy" machines made in defiance of well-known laws, and, although it may be amusing to many to see the railway reduced to its lowest terms, the experiment will prove far more curious than useful.

HOW MIRRORS ARE SILVERED.—The following description of "silvering" plate glass for mirrors is mainly founded upon the method pursued at St. Gobin and Ravehead. After polishing, each glass tablet intended to make a looking-glass is silvered, or, more correctly, coated on one side with an amalgam of tin. In the preparation of this amalgam tin foil is used, but it must be beaten from the finest tin, and possess a surface similar to that of polished silver. The art of silvering is simple, and merely requires dexterity. The glass plate having been thoroughly cleansed from all grease and dirt with putty-powder and wood ash, the workman proceeds to lay a sheet of tin foil smoothly upon the table, carefully pressing out with a cloth dabber all wrinkles and places likely to form air bubbles. He spreads over it a quantity of mercury, taking care that all parts are equally covered, and then the glass plate is pushed gently on to the surface, commencing at one edge. The glass is allowed to remain for twenty-four hours; it is then removed to a wooden incline similar to a reading-desk, to allow of the excess of mercury draining off. As the amalgam gradually sets, the incline is increased till finally the plate reaches the perpendicular, when the process is finished, and the mirror removed to the store-room.

"IMPROVED" METHOD OF PROPELLING BOATS.—We notice the following description of a propelling apparatus in general circulation. We recollect having seen already several models of this most valuable idea, and do not understand how it can be patentable: To the bar or lever of the paddle are hinged two blades in such a way that when moving forward through the water the pressure of the water will close them. These are kept from closing against each other by one or more stops, interposed between them and attached to the bar, so that as the paddle begins to make the stroke the pressure of the water may open or spread the blades so as to present the greatest possible surface. The upper ends of the bar are designed to be attached to the shafts, which are arranged so as to be operated independently of each other. The shafts are placed in line with each other, and a pintle may be attached to the end of one shaft to enter a socket in the end of the other shaft. Levers are attached to the inner parts of the shafts, extending above and below said shafts, and having handles attached to their upper ends and foot-rests attached to their lower ends, so that the operator can apply hand and foot power.

THE ARTILLERY OF THE PEACOCK.—The monster weapon with which the turrets of the ironclads of the future will be armed, will far surpass the most powerful artillery at present in existence, the Woolwich Infants of 35 tons weight, and a bore of 12 in. in diameter, and the great guns which Krupp is now making for the Germans being alike eclipsed by the new weapon, which will have a bore of nearly 15 in., and weigh 60 tons. These guns will be built by coil upon coil of wrought-iron and a steel tube; a system which insures the greatest possible strength and immunity from danger of bursting, and practically imposes no limit to the size of the guns. They will be fitted with a movable breech-loading arrangement. The Woolwich Infant will throw a 700 pound shot six or seven miles; the new gun will hurl a projectile weighing 1,100 pounds, (half a ton), over a range which has yet to be determined. As the antithesis of this enormous gun, the new steel mountain gun has now been placed in the model room of the Royal Gun Factories. The gun weighs only 200 pounds, but it can fire a shell of 7 pounds, with good effect, up to 3,000 yards, and with its little carriage is designed to be conveyed on the backs of mules.—*Iron Monger*.

Weekly Stock Review.

THURSDAY, Feb. 5, 1874.

Stocks have been rather quiet this week, although the market has shown a better feeling and prices have advanced to a small extent. On Friday last, the market was a little stronger than at close of our last review. At the close Con. Virginia was \$6 higher; Belcher, \$2; Beat & Belcher, \$1; Ophir, \$3; California, \$3; and the market generally firmer. The inclemency of the weather interfered to some extent with business.

On Saturday, the close of the week, there was no particular change outside of Ophir, which declined \$4. In outside stocks, which consist of Ely, Eureka, Philadelphia and California stocks, there was generally an improvement. Raymond & Ely advanced to \$37 under the additional persuader of a new development at one or the other end of the mine.

On Monday the bad weather influenced the market to a great extent, and there was little business done, while prices as a general thing showed a decline.

On Tuesday the weather cleared up and with it the aspect of the Stock Market. Belcher closed \$7 better; Crown Point, \$3; Con. Virginia, \$8; California, \$2; Ophir, \$5; Savage, \$2.

Wednesday showed a still increasing atrength and activity in the market. At the close a general rise was manifest: Alpha, \$7; Belcher, \$3.50; Bullion, \$3; Crown Point, \$3; Chollar, \$5; Con. Virginia, \$5; California, \$2; Gould & Curry, \$1.50; Hale & Norcross, \$2; Kentucky, \$2; Overman, \$5; Ophir, \$3; Savage, \$3; Segregated Belcher, \$13. There are no special features in the market to report, everything being rather quiet than otherwise.

The Eastport Coos Bay Coal Mining Company have declared a dividend of \$5 per share, amounting to \$2,500, payable immediately. This is the first dividend since last April. In the meantime, considerable money has been expended in needed improvements. Two fine steamers have been built for thiertrade, and are now running regularly between Coos Bay

and this port. The Company find no difficulty in disposing of all the coal they bring to market, and at good prices.

An advertisement has been published by the Hartford Mining Company, calling upon the stockholders of the old corporation for the surrender of their stock, receiving in return twenty shares of new for each share of the old stock surrendered. A levy of five cents upon each share of new stock has been made, which will enable the commencement of work upon the mine. It is proposed to start up work and put the mine in order.

The Alpha Cons. M. Co., which has increased its capital stock, issued its new stock this week in the proportion of five shares of new stock for one of old.

The 23 mining assessments levied January footed \$748,000 against 24 in January, 1872, aggregating \$550,000. Thrsse dividends paid in January, aggregated \$827,000, against six in January, 1872, aggregating \$573,000.

SALE OF EMMA ORE.—On the 29th ult., 2 tons of first-class ore from the famous, though much defamed Emma mine, sold for \$29.60, or nearly 1,000 ounces per ton. One hundred tons of second-class ore brought \$3,800 or \$38 per ton. One hundred tons of third-class ore brought \$15,655 per ton or \$156 per ton. The length of the ore body is 50 feet and increasing and the width from 20 to 40 feet. The large pump to clear the deepest workings where the big strike was made is working admirably. This speaks well for the mine, as does the fact that the amount of Emma shares called for by several Salt Lakearamonts to about 400 shares or \$8,000. Mr. Henry Sewell, the well-known mining engineer, bought 100 shares himself, showing his faith in the mine in a substantial manner.

AMERICAN FLAT.—Nothing has been done in this mine during the past week on account of the water tapped in the Baltimore shaft, which made it necessary for the Baltimore to have the entire use of the shaft to drain the water as speedily as possible.

LOWER COMMONS M. Co.—Trustees, J. A. Pritchard,
 Robert Sherwood, H. C. Kibbe and S. A. Chapin.
 PACIFIC POWER Co.—Trustees, J. F. Pierce, J. Ba-
 ker, Jr. and J. S. N. Shepard. Secretary, J. F. Nes-
 mith.
 BEARCH & PAXTON M. Co.—Trustees, George S. Dodge,
 R. F. Bunker, Wm. Burling, John Landers and George
 Congdon.
 GLOBE MINING Co.—Trustees, R. L. Tracy, (Presi-
 dent), G. W. Fisher, (Vice-President), G. W. Deil-
 zer, Thomas Coal and M. D. Townsend. Jos. Maguire,
 Secretary and F. M. Thayer, Superintendent.
 JOACET M. Co.—Trustees, Wm. M. Lent, George
 S. Dodge, John F. Boyd, G. W. Grayson and W. O. Par-
 ker.

The following Companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

PACIFIC M. Co.—Jan. 30. Location: State of Nevada. Directors, Hiram Tubbs, J. A. Pritchard, J. E. De La Montagnie, W. F. Myers and Wm. Haelehurst. Capital stock, \$4,800,000, divided into 48,000 shares.

California M. Co.—Jan. 30. Location: Napa Co., California. Capital stock, \$6,000,000. Trustees—Thos. R. Hayes, J. L. Sanford, Joseph W. Winnis, Coll. Deane and Alex. Badlam.

PACIFIC SLOPE WOOL GROWER'S ASSOCIATION. Feb. 2. Object: To raise, purchase and sell wool, to lease and purchase sheep ranges, and to acquire such real estate and other property as may be necessary for the purposes of the association. Directors—Wm. B. Doughton, Wm. O. Sleeper, Samuel D. Keith, Edwin H. Black, John E. Ayer. Capital stock, \$200,000, in shares of \$10.

THURSDAY Feb 5 1874

Stocks have been rather quiet this week, although the market has shown a better feeling and prices have advanced to a small extent. On Monday last, the market was a little stronger than at close of our last review. At the close Con. Virginia was \$6 higher; Belcher, \$2; Beat & Belcher, \$1; Ophir, \$3; California, \$3, and the market generally firmer. The inclemency of the weather interfered to some extent with business.

On Saturday, the close of the week, there was no particular change outside of Ophir, which declined \$4. In outside stocks, which consist of Ely, Eureka, Philadelphia and California stocks, there was generally an improvement. Raymond & Ely advanced to \$37 near the additional pnersder of a new development at one or the other end of the mine.

On Monday the bad weather influenced the market to a great extent, and there was little business done, while prices as a general thing showed a decline.

On Tuesday the weather cleared up and with it the aspect of the Stock Market. Belcher closed $\frac{7}{8}$ better; Crown Point, $\frac{3}{8}$; Con. Virginia, $\frac{5}{8}$; California, $\frac{3}{8}$; Ophir, $\frac{5}{8}$; Savage, $\frac{1}{2}$; much defamed Emma mine, sold for $\$29.60$ or nearly 1,000 ounces per ton. One hundred tons of second-class ore brought $\$3,800$ or $\$38$ per ton. One hundred tons of third-class ore brought $\$15,655$ per ton or $\$156$ per ton. The

Wednesday showed a still increasing strength and activity in the market. At the close a general rise was manifest: Alpha, \$7; Belcher, \$3.50; Bulliott, \$3; Crown Point, \$3; Chollar, \$5; Con. Virginia, \$5; California, \$2; Gould & Curry, \$1.50; Hale & Norcross, \$2; Kentucky, \$2; Overman, \$5; Ophir, \$3; Savage, \$3; Segregeated Belcher, \$13. There are no special features in the market to report, everything being rather quiet than otherwise.

The Eastport Coos Bay Coal Mining Company have declared a dividend of \$5 per share, amounting to \$2,500, payable immediately. This is the first dividend since last April. In the meantime, considerable money has been expended in needed improvements. Two fine steamers have been built for the trade, and are now running regularly between Coos Bay and Astoria.

and this port. The Company find no difficulty in disposing of all the coal they bring to market, and at good prices.

An advertisement has been published by the Hartford Mining Company, calling upon the stockholders of the old corporation for the surrender of their stock, receiving in return twenty shares of new for each share of the old stock surrendered. A levy of five cents upon each share of new stock has been made, which will enable the commencement of work upon the mine. It is proposed to start up work and put the mine in order.

The Alpha Cons. M. Co., which has increased its capital stock, issued its new stock this week in the proportion of five shares of new stock for one of old.

The 23 mining assessments levied January footed \$748,000 against 24 in January, 1872, aggregating \$550,000. Thrs dividends paid in January, aggregated \$827,000, against six in January, 1872, aggregating \$573,000.

SALE OF EMMA ORE.—On the 29th ult., 2 tons of first-class ore from the famous, though much defamed Emma mine, sold for \$29,600 or nearly 1,000 ounces per ton. One hundred tons of second-class ore brought \$3,800 or \$38 per ton. One hundred tons of third-class ore brought \$15,655 per ton or \$156 per ton. The length of the ore body is 50 feet and increasing and the width from 20 to 40 feet. The large pump to clear the deepest workings where the big strike was made is working admirably. This apeaka well for the mine, as does the fact that the amount of Emma shares called for by several Salt Lake amendments to about 400 shares or \$8,000. Mr. Henry Sewell, the well-known mining engineer, bought 100 shares himself, showing his faith in the mine in a substantial manner.

AMERICAN FLAT.—Nothing has been done in this mine during the past week on account of the water tapped in the Baltimore shaft, which made it necessary for the Baltimore to have the entire use of the shaft to drain the water as speedily as possible.

RESERVOIR.—The work of sluicing out the big reservoir, on Negro Hill, belonging to the water company, is completed. In the future there will be no lack of water for miners, and work will be vigorously pushed in all the hydraulic on the line of the ditch.

CHIAPA.—A little son of Mr. Schlund of this town, found a nugget of gold weighing \$2, in the public school-yard the other day.

EL DORADO COUNTY.
CAVED UPON.—*Republican*, January 29th: On Monday afternoon last, Mr. Levi Shepsard was caved upon in the "Roae" mine, and seriously injured. He went into this tunnel, and just reached the end when a mass of rock and dirt caved from overhead, doubling him up, and completely covering him. He was taken out in a few moments, unconcious, but immediately came to his senses, but still lies in a very critical condition.

HUMBOLDT COUNTY.
SALE.—*Register*, January 30th: The Pride of the Mountain mine was sold at Sheriff's sale last Saturday, and was knocked off to J. Ginnah for \$900. The property is worth at least nine thousand.

MINING COUNTY.—*Independent*, Jan. 24: Blawie's furnace is still running, but is expected to lay up for repairs. The Omega tunnel is working but a light force and the Union but one shift, so times are pretty dull for the time being. The water works are in good running order throughout, but have not yet ateamed up.

MONTEREY COUNTY.
THE CATARINA COAL MINE.—San José *Mercury*.
Feb. 2: The Secretary of this mine received the following letter last night from the Superintendent, dated Tres Pinos, January 27th: "I will give a statement of the mine up to the 27th of January, 1874. The tunnel is 90 ft. deep. The last 15 ft. the prospect is 100 per cent better. We have discovered a new ledge of hard coal far superior to the one we have been working, and the deeper we go the coal is looking better. The ledge pitches 45 degrees, and I expect that in 60 or 75 ft. more the two ledges will unite." This coal is certainly of superior quality.

NEVADA COUNTY.

IDAHO MINE.—Union, January 31st: This mine has been steadily at work and yielded for the four weeks past about \$54,000. This was not as heavy a run as the mine has had, and is not as heavy as the mine will have in many of the months of the future. The Trustees will meet next Monday, when a dividend of \$10 to the share of stock—\$31,000 in all—will probably be declared. We have heard of one transaction in the stock some three or four weeks ago. The transaction we heard of was fifty shares selling at \$750 per share. That would make the market value of the mine \$2,325,000. The purchaser of the stock, in the transaction of which we speak, knows all about the mine.

EUKEKA MINE.—The Eureka's principal work consists in sinking in order to find a paying ledge deep down. The prospecting shaft is now down about 1,100 feet, but is not on the ledge. When it reaches an indication of the wall, which must occur before very long, a cut will be run into the ledge, and the quality of the ore will then be determined. The 500-foot level is running to the west to develop the pay in that part of the mine. The mill has been running only ten stamps during the month and those have given more than enough to pay all expenses.

NORTH STAR MINE.—The mill has been run about 18 days during the month, and the clean up after the run was not far from \$14,000. They have one very great improvement, a railroad from the new mine to the mill. This railroad was built at a cost of \$1,000. On this road one horse hauls two tons of rock at a load, and without the railroad two horses could not haul more than half a ton. The new shaft is down 400 feet and the second level has been run some 300 feet to the east. The lode in the second level looks very well. Everything about the mine and mill is working smoothly.

EMPIRE MINE.—The shaft is now down about 1,300 ft. on the incline, and soon the 14th level will be started. Pay ore is coming from the 10th, 11th, and 12th levels. The yield for the last four weeks has been something over \$16,000 worth of gold, which gives large profits. The underground appearance of the mine is excellent.

ALLISON RANCH.—We have it from pretty good authority, that this mine, in connection with the first extension south, will be worked in the spring.

MACENTA.—In the second level, running west, this mine has a ledge from 2½ to 3 ft. thick, which shows splendidly in free gold and heavy sulphurets. The work of sinking for another level, and hauling to the mill for a crushing, will be resumed as soon as the weather permits.

TOWN TALK.—Hss been running all the month, crushing gravel. The stamps are run by water. This water plays on a wheel which is attached to the end of the cam shaft. This is something new in water-wheels, and deserves the attention of mill men. The Town Talk is yielding to its two owners something over \$2,000 a month, with an expense less than \$1,000.

BLUE GRAVEL COMPANY, of Alta Hill, is idle now, but it is only waiting for a turn in the weather to resume work.

DARTMOUTH GRAVEL has been in good luck for the past month and has taken advantage of water to run a ten stamp mill.

OTHER MINES.—Judge P. H. Paynter is Secretary for some four or five co-operative and other companies. He informs us that the stockholders in all of them—working miners they are—will be ready in a few weeks to begin active work.

NEW YORK HILL.—Ore is being continually taken out of the upper tunnel and it has been demonstrated that the poorest ore yields a handsome profit over all expenses. The upper tunnel shows a large vein of ore and stoping is going steadily on. The tunnel from the bed of the creek is in about 200 feet and indications show that they are near the ledge from the deposits of caliche and casing rock. It is pretty certain that 25 feet more will reach the main ledge in the lower tunnel.

KENTUCKY MINE.—Work is going forward only in the 100-foot level, there being too much water in the depths lower than that. The ledge in the 100 ft. level is about two ft. thick, and shows free gold and very rich heavy sulphurets.

GRASS VALLEY NEW MINING COMPANY held its annual meeting last Monday and elected the following Trustees: George Fletcher, P. H. Paynter, Wm. Prisk, J. Carter and Samuel Tyrell. Mr. Fletcher is President, and Mr. Paynter, Secretary of the company. A meeting of the Trustees was held on Friday, and an assessment was levied. The company will commence work early in the spring, and will keep work going all through the summer and fall. The stock of the company is owned by home people, mostly by working miners, making the company a co-operative one.

PITTSBURG.—The owners have divided about \$900 among the three of them, and are only about 20 or 40 ft. down. All the pay they have received has been from rock taken from the shaft. No drifts have as yet been run. The owners are putting up a whim and a building over the shaft. The mine will have to open and work itself, and no outside capital is now asked for by the McCook Brothers and E. P. Sanford, the owners.

COB has been pumping pretty much all winter, but has done no sinking stoping or drifting. Preparations are now being made to take out a

trial crushing from the lower depth of the mine, where the rock is said to be rich.

GREEN HORN shaft is now down 490 ft., and the ledge in the bottom of the shaft is about 2½ ft. in thickness. The ledge is highly metalliferous.

SLATE LEDGE, (or Perrin's,) is looking better than it has for a year past. Work is being prosecuted with vigor.

PLACER COUNTY.

MINING.—Folsom Telegraph, Jan. 31: Miners are repairing flumes and making preparations to commence operations in the claims among the hills and gulches east of Ashland. They are supplied with plenty of water from the North Fork ditch.

STANTON UP.—Herald, Jan. 31: We learn that the large hydraulic mines at Gold Run, Dutch Flat, and other parts of the county have commenced in earnest.

PLUMAS COUNTY.

DAMAGEN.—National, Jan. 24: The recent high water damaged the mining ditches to some extent. The Plumas ditch broke in several places, but it will be repaired in season for the commencement of the spring run. The rush of water cleared the dirt out of the new reservoir belonging to Garland & Dow. We could not learn what the damage was.

SIERRA COUNTY.

THE SIERRA BUTTES MINE.—Messenger, Jan. 31: This mine, now regarded as the most valuable and extensive gold mine of Sierra county, is upon a lode, which is split up into three branches with intervening lodes of hard blue slate between, of the same character as the lodes. The rock is extracted through tunnels, of which there are seven. The lowest is on a level with the mill, the horizontal distance from which to the uppermost workings is 1,400 feet. The altitude of the mine above the Yuba gives splendid facilities for working and drainage for years to come, and there is a probability of the mine being worked and drained through tunnels to the depth of 3,500 feet in the lode.

SOLANO.

ST. JOHN MINE.—Vallejo Chronicle, Jan. 31: The St. John mine has shut down its furnaces until a resumption of dry weather. The heavy rains have rendered the road between the dumps and the reduction works so bad that it is almost impossible to move the ore to the furnaces. The supply of coke is also almost exhausted, and the muddy road from Vallejo to the mine makes it very difficult to replenish their fuel. The work of getting out ore, however, still proceeds, without any reduction of the number of men employed.

TRINITY COUNTY.

A GOON BEGINNING.—Journal, Jan. 31: The first clean-up of the season—and that only a partial one—was made in the Union Hill claim, above Douglas City, last week. They had run only six days and expected to take out from \$200 to \$300, but were more than agreeably surprised at cleaning up the nice little sum of \$2,068. They have heretofore been working where the gravel was only from 3 to 6 ft. in depth, but have lately run into a gravel bed that is from 12 to 14 ft. deep. The Union Hill claim is destined to be one of the "big things" of this county.

MINING ACCIDENT.—The raise in Garden, Sydney and Ten Cent gulches, on Wednesday last, resulted disastrously to Carson & Goring. The water broke over their bulk head just below where the school house stands, and the result is that about three-quarters of a mile of their flume is now covered with from 12 to 15 ft. of tailings, which makes it a total loss, as it will never pay to unearth it. The owners of the claim intend to put in a short flume above the break.

TUNNEL CAVEN.—The flume, in the Rule Bros.' claim, runs through a tunnel 17 ft. below the surface. On Thursday last, about 40 ft. of this tunnel caved, and as they were running water at the time, the flume soon filled with dirt. A couple of days' work will put it in running order again.

HARN AT IT.—Water is now plenty, and miners everywhere in this section are making good use of it in sluicing.

TUOLUMNE COUNTY.

LADY WASHINGTON.—Independent, Jan. 31: Men have gone into the hills to work on the Lady Washington mine. Superintendent Dorsey says it is the intention of the company to sink 200 feet on the vein, to prove its stamina. Thus far, indications are favorable to good results.

GOLDEN GATE.—From a partial "clean up" of a four days' run at the Golden Gate mill, two pounds of amalgam was the product. Allowing two-thirds of this to be gold, we consider it to be an excellent showing.

GOON PAY.—Democrat, Jan. 31: The Tuolumne Hydraulic Mining Company, whose claim is in Table Mountain, and formerly known as the Rough & Ready, cleaned up three boxes at the head of their sluices last week, from which was taken \$900. It was good pay for the interrupted labor of six persons for four weeks, estimated at not more than two weeks of regular washing for that force.

Some of the stockholders in the Kincaid Flat mining claim from San Francisco, spent a few days at the claim and in Sonora, the past week. They had an investigation of a box or so at the head of the flume, where sufficient of the yellow metal was developed to satisfy them the ground being washed, is yielding very handsomely.

VENTURA COUNTY.

PURCHASE.—Signal, Jan. 31: The Sespe and Piru Mining Company have purchased the

Felician mine in this county with twelve hundred acres of land. The company is regularly incorporated, and will begin work in a few weeks. They will get their water from the Sespe and Piru, and their head-quarters will be about 25 miles from this place. The ditch will be about 18 miles long.

Nevada.

WASHOE DISTRICT.

OPHIA.—Gold Hill News, January 31st: Sinking the winze on the ore body developed by the south drift on the 1,300-foot level is making steady progress, the bottom in good ore. The up raise from the 1,500-foot level to connect with this winze is up a distance of 70 feet in good ore. Two ore bodies have been developed by the recent prospecting operations in this mine; one of 14 feet in thickness, and of exceeding richness, lying next the west wall of the ledge, and another from 60 to 100 feet in width, of good milling ore, near the east side of the ledge, with a body of barren quartz and low grade ore intervening. The west body of ore appears to incline to the westward, although it is the opinion of experts who have examined both, that the two bodies will unite at no very great depth. Both the intervening belt of quartz and the large east ore body have the inclination of ledge to the eastward. The south winze on this level was started in the west edge of the east ore body and passed through the ore during the week into the low grade ore and quartz intervening between the west and east bodies. This winze will be sunk perpendicularly until the west wall is reached, when it will incline with the dip of the ledge to connect with the main south drift on the 1,700-foot level, and thus ventilate that portion of the mine. Large and capacious ore dumps are being erected, and every preparation is being made to begin the extraction and reduction of ore, there no longer being a doubt as to the extent and worth of the ore bodies being developed.

BALTIMORE CONSOLIDATED.—On Saturday evening last a heavy flow of water was tapped in the bottom of the shaft. The next day a breakage of some of the pumping machinery ensued, following which came a small split in one of the hoilers, entirely stopping the hoisting and pumping, until the water had risen 160 feet in the shaft. The machinery, however, has all been repaired and the water lowered to within 30 feet of the bottom of the shaft, and it is expected that work at the lower station can be resumed in a day or two more.

CONSOLIDATED VIRGINIA.—The south drift is now connected with the north winze on the 1,300-ft. level. This connection has thoroughly ventilated the stopes below the 1,200-ft. level, and purified the air current throughout all the lower openings of the mine. The work of cutting out for a square set, preparatory to sinking the winze to the 1,400-ft. level, has been commenced. The north winze is now sunk 47 ft., and the shaft 42 ft. below the 1,300-ft. level. Work in both shaft and winze will be carried on without intermission. All of the ore breasts from the 1,200 to the 1,000-ft. levels continue to look well.

TYLER.—The water has been so nearly drained from the shaft that it is expected that work can be resumed in the drift at the lower level by Monday next. The new hoilers have arrived.

BELOHER.—Daily yield 550 tons of ore. The mine continues to look as promising as ever, and the daily yield of ore unabated. The main incline is down 81 ft. below the 1,400-ft. level. The north drift at the 1,400-ft. station is in 49 ft., and is being pushed ahead with all possible energy. The south winze on the 1,300-ft. level is down 86 ft.

CROWN POINT.—Daily yield of ore 450 tons, mostly from the 1,000, 1,200 and 1,300-ft. levels. Breasting out on the ore body, on the ore body on the 1,400-ft. level has been commenced, the ore being of a fine character. A drift north, which is in rich ore, has been started to connect with the cross-cut from the main drift. A winze has also been started at the east end of the north cross-cut, which is down 12 ft. in very rich ore. Since the connection has been completed between the Crown Point and Yellow Jacket the temperature of the air has been greatly lessened on the 1,400-ft. level.

JACOB LITTLE.—The whole face of the lower tunnel is now in ore, some streaks of which show very richly in free gold and black sulphurets of silver. The Superintendent is of the opinion that when the tunnel is 50 ft. further in, 50 tons of good ore per day can be extracted.

LEO.—Owing to the increase of water in the incline, Superintendent Moyle has been obliged to concentrate his forces at that point, and stop work in the main drift.

DAYTON.—Lowering the steam pump so as to drain the water from the third station is making good progress. But little ore has been extracted from the mine during the week, owing to inability to get the ore hauled to the mills. The services of two additional mills, the Devil's Gate and Briggs, have been secured and will be started up on ore from the mine as soon as the roads are in condition.

OCCIDENTAL.—The engine is not yet in operation on the main adit level. The winze is being sunk directly in the ore body, the quality of the ore being good and the size of the body unknown.

UTAH.—The west drift, on the 400-ft. level, is steadily advancing through soft picking ground. There is reason to suppose that this drift is now in close proximity to the ledge.

JULIA.—The main southwest drift, on the 1,000-ft. level, is still driven ahead, following the ledge and running through ore which aver-

ages by assay \$40 to \$60. Of what extent this ore body is, has not yet been determined.

HALE & NOBSCROSS.—Both drifts are still carried forward to the northward and southward in the vein on the 1,900-ft. level. Two cross-outs have been made in the vein on this level. No ore has been encountered. Daily yield of ore, 40 tons, mostly from the upper levels of the mine.

LADY WASHINGTON.—The usual good progress is being made sinking the main shaft, there being no water to interfere with the work. The Justice and the New York Consolidated shafts are only 800 ft. southerly and northerly from the Lady Washington, and from 450 to 600 ft. deeper, therefore they keep this shaft well drained, which is an important item in the saving of firewood, machinery, etc.

SEQUEBOAT ROCK ISLAND.—On passing through the clay wall last Monday into the ledge, a large body of water was encountered, rendering it necessary to put a bulkhead in face of the tunnel to prevent caving. A drift was immediately started north from the tunnel, which will be run about 100 ft., when a crosscut will be made to prospect the ledge.

CALIFORNIA.—The drift running north on the 1,300-ft. level (of the Consolidated Virginia), is now in 130 ft. from the shaft. It is intended to connect this drift with the south drift on the 1,300-ft. level of the Ophir, and secure the ventilation of both mines.

CHAPIN AND EAST COMSTOCK.—Work was commenced some months ago on the shaft of these two companies, located on the Gold Canyon branch of the Comstock, a few hundred feet east of the Overman new shaft. It has been sunk to a depth of 133 ft. by the use of a windlass, when, steam power becoming necessary, the requisite machinery for hoisting works has been procured and is now in course of erection. It will be ready for resumption of work in about 15 days.

CHOLLAR-POTOSI.—An important ore development has been made during the week in the prospecting drift south from the 1,000-ft. station. The extent of this ore body has not yet been determined, but the indications are favorable for a fine development.

SILVER HILL.—Sinking the shaft for a new level is making rapid progress. The south drift, at the 2d station, has developed a fine body of good ore, which in looks and character, can not be distinguished from the ores of the regular Comstock lode.

ROCK ISLAND.—Commenced cross-cutting at end of the drift, north from main tunnel, last Tuesday.

GOULD & CURRY.—Still carrying forward the east cross drifts on the 1,500 ft. level, also the north and east drifts on the 1,700 ft. or lowest level. Re-opening the drift at the 6th station level is being vigorously prosecuted.

NEW YORK CONSOLIDATED.—Sinking the main shaft is making better progress, the rock being softer and becoming more and more so, with considerable porphyry coming in.

SIERRA NEVADA.—Daily yield 60 tons, keeping the mill steadily running. Sinking the new shaft is making rapid progress.

INDEPENDENT AND OMEGA.—The contractors are making four ft. per day sinking the new shaft.

CROWN POINT EXTENSION.—Work is resumed for the development of the lodes of this company by means of the new shaft of the Ohapin and East Comstock, about 1,000 ft. south. The shaft is to be sunk to the depth of 1,000 ft. as soon as possible.

ANDES.—This company are erecting hoisting works, and are placing the hoisting engines at the west shaft of the Consolidated Virginia Company.

SENATON.—Sinking the shaft making steady progress, the quartz in the bottom of the shaft continuing to improve in looks, and the streaks of ore in quality as the sinking progresses.

FARMOUNT.—The northeast drift from the main west tunnel has been driven a distance of 45 ft. the entire distance through ore of a fine character.

SOUTH COMSTOCK.—Now shaft down 18 ft. and making good progress, sinking through quartz and gypsum ledge matter, which improves in appearance.

BULLION.—The north drift from the 1,700 ft. station of the Imperial making steady headway.

ARIZONA, UTAH AND GLOBE.—The main west drift on the 1,400 ft. level is still driven ahead, the face in hard blasting ground. Raising up to connect with the old upper works of the Globe is making steady progress. Sinking the incline making good headway.

SUCOR.—Sinking the little shaft for a new level making rapid progress. Drifting on the ledge at the 200 ft. level is pushed vigorously, the face of the drift still in good ore. Sinking the new shaft east of the hill making rapid progress.

SUTRO.—The prospect for striking a good body of ore in the winze is very flattering. Assays average \$18. The north drift is in 90 ft. Will commence crosscutting at a distance of 100 ft. From present appearances there is no doubt a good ore development will be made.

OVERMAN.—The winze, from the 1,000 to the 1,200 ft. level, is down 200 ft., following the dip of the ledge, the bottom still in rich ore. The main west drift on the 1,200 ft. level is still pushed vigorously ahead, the face in hard blasting ground. A portion of the air pipes, and machinery for the air compressor and engine have arrived, and the remainder is expected in a very short time.

SAYAOE.—The main southwest drift, on the 1,900 ft. level, is still driven vigorously ahead, the face in hard blasting rock.

Practical Miners.

Sombody signing himself A. C. is writing "notes on metallurgy" for the *White Pine News* and his first article under that title, though saying little on the subject, is well worth reading. It is as follows: To contribute to matters of special interest to our community I propose to deliver a few articles on metallurgy and kindred subjects, but, as a preliminary, copying the example of the fond mother, who, to ensure good behavior, commenced the day by turning up the little fellow and spanking him heartily, I propose to be "a little rusty" on the miner. Twenty years' connection with him, exposes his crotchets to a lamentable and often a ludicrous view. Earnest and honest, he runs but does not read, and is more he-d deviled than the swine that ran down the mountain. Professing the most profound contempt for science, he is the greatest theorist alive. But such theories! They would startle the man in the moon, though he is presumed to be familiar with moonshine.

Exactly in proportion to his ignorance, is he positive in his absurdities, which give all the hues of the rainbow. The practical man has his own experience only, and must be long lived to acquire much knowledge, while the "scientific cuss," as he calls him, can have the experience of all, united in many cases with individual practice. Practice may remark a fact, and it may fatally mislead. A thousand ships crossed the ocean, commanded by practical seamen, and Lieutenant Manry took their log-books and dispatched them back safely in half the time. The weatherwise foresees a storm in the evening, while the Topographical Bureau gives notice three days in advance. A practical miner, of twelve years' experience, deposes in a mining case, in Nevada, California, that "he never knew one vein to cross another," and a *practical jury* made a consonant decision. A two hundred and fifty foot tunnel has been run through bed-rock, at \$30 per foot, to cut a vein at fifty foot depth. Tunnels to investigate Treasure Hill have been run on the east side, and, owing to the dip of the rock, every foot driven approaches the surface. A mobilization of White Pine Mountain is proposed, and accepted by practical men, in despite of geometry and geology. Incongruities are the sure result of practical views, unless they accord with rules dictated by scientific observation. A thousand *perpetual motions* have been invented by thinking men unversed in the philosophy of mechanics. A builder of twenty years, framing the hip-roof of a warehouse, was unable to raise a perpendicular on an oblique surface, and detained some twenty hands, was in a peck of troubles, until relieved by a bystander, when he said a few naughty words, and told his son, a youth of seventeen to drop his tools and go immediately to school and study geometry, and not be such a stupid as his father.

It is amusing to hear the miner descant on his *sulphates*, his *grey carbonates* and magically convert harmless matter into horn silver, and at the same time torturing innocent veins, by his *spurs and angles*, entirely unconscious that the poor things were like Jeff Davis praying (I had almost written praying) "to be let alone" and take their rectilinear course. But the acme of absurdities is the speculations respecting White Pine and Limestone districts. Tom Noodle will squarely allege: "there is no fissure vein on Treasure Hill. I have seen it, and ought to know," while another eapient, to soften the asperity of the remark, says "well, if there isn't a fissure, there is a *break*." Another wiseacre, in punishment for being such a fool, refuses to ride and packs his blankets, crying, "there is no fissure vein there!!" "Montgomery street, taking the cue from *honest miners*, peeps knee-deep into the rock, cries "quantum snf," and throws up the sponge. The mishaps that befell early smelting operations here, were the legitimate results of practical manipulations, unguided by science. A resumption will demonstrate no infirmity in either the silver or lead, and that adequate fluxing was only needed to a triumphant success. And now, my good friend, if you are sufficiently *warned* to be like a good boy and attend to your lessons, in our next, we will discuss the rudiments of metallurgy and show the need of many brains to reduce ores. You may, in spite of pigheadedness, stumble on a rich vein, but your inability to enjoy it will be manifested unless you can intelligently aid in its elaboration.

ALUMINUM.—J. S. Howard, of Springfield, Massachusetts, has, it is said, after three years of patient experiment, succeeded in extracting from clay, at a price which will compete with the foreign production, the aluminum for plating which has been used extensively in Europe, but which has never been manufactured to any extent in this country, owing to the cost of extracting it under the old method. Mr. Howard affirms that by this method the aluminum can be furnished nearly a third cheaper than the retail price for the foreign production.

IMPROVED BUTTER PRINT PRESS.—A patent has been granted for an invention, the object of which is to furnish to farmers and dairymen an improved butter print or press, by which the butter may be quickly and evenly formed into cakes of required weight, with suitable print marks thereon, without previous weighing. It consists in a sliding box, into which the butter is introduced and pressed on a printing block, by a follower block and lever, into suitable shape and weight.

San Joaquin Mines.

Following are extracts of a letter from Harvey Boone to his partner in Pioche, Mr. Dolman, dated at Del Norte, on the head waters of the Rio Grande, Colorado Territory, January 7, and published in the *Pioche Record*, of the 24th ultimo:

Parties fitting out in Pioche can take their choice of three routes. First, go up to the mouth of the Grand River, and strike for the Indian agency on the Uncompahgre, thence down the west side of the San Juan Peaks. From the agency down, wagons have passed over—or, at least, such statements have been made. Second, the way we came, in which case they will wish they had gone some other road. Third, by Lee's Ferry, across the Colorado, following the Mormon road until the road leading to Fort Defiance is found—following it to the fort; thence to or near the mouth of the Animas, and following it to the mines.

Parties choosing the northern route should start early, so as to cross the streams entering into the Grand river, before or by the first of May. By following up the south side of the Grand river, until the Uncompahgre is reached, thence following up its south bank to its head, it will carry you to the summit within a few miles of the mines. But the surest plan would be to leave the river and strike south across the San Miguel and Dolores, to near the head of the Mancos river. A good trail will be found up these streams, and a wagon road could be made without much difficulty. Besides some very rich surface diggings have been found near the head waters of some of these streams. I have talked with three different parties who crossed this section of country last summer. They all think they can find good ledges, as well as pay gravel, if the Indians will let them prospect.

I have said a good deal about the routes that may be traveled. Now I will say something about the distances, feet, etc. Commencing at Pueblo, thence via Sangre de Cristo, or by the Aheya Pass to Del Norte, a distance of 150 miles; thence up the Rio Grande and over a summit 13, 500 feet high—distance 100 miles—making 250 miles of wagon road; that is, when it is finished, which will not be before next September. Some 60 miles of the road is completed, leaving 40 miles of heavy road to be done. Travelers can find no feed, except a little grain, after leaving Pueblo until they reach the San Juan mountain. Grain sells at four cents per pound. The Rio Grande Valley is pastured off as bare as cattle and sheep can eat it.

I have talked with a few men who are willing to acknowledge that they don't know that any of their claims are valuable, but agree in this: that there are more lodes well defined, and more mineral than they have ever seen in any district before. A little may be good milling ore, but most of it is smelting ore. Furnaces must be built on the south side of the mountain, as it is plain to see that no ore, except the very richest, can ever be hauled up from 2,000 to 3,000 feet over a summit that is impassable six months of the year.

Good coal has been found within 15 miles of Animas City (or Hermosa, as it will be called). The stage fare is \$20 from here to Pueblo, and \$10 from there to Denver. Everybody thinks we will have a rush, and I feel satisfied that many thousands will come here in the spring. The mines will not be developed as fast as most people think.

The Little Annie, a discovery made last summer 35 miles north of here, and near the summit, has produced some of the richest quartz ever exhibited in any country—some of it more than half gold, and rock that showed no gold assayed very high. There is some doubt here among the miners about the true lode being found. However, it is bonded at \$410,000.

It is the intention of the Pioche miners now at Tierra Amarilla to do some prospecting along this mountain range. The range is very extensive, and must average near 100 miles from the summit to the valleys, and about 150 miles in length. Near the line of the road from Tierra Amarilla to Animas, is where the rock formation changes from a sandstone to other kinds of rock. It is along this sandstone formation that the almost endless beds or fields of stone coal commence.

The winter and early spring route from Pueblo to the mines will be via Abiquia, on the Rio de Chama and Tierra Amarilla to Animas City. This route, avoiding as it does, the snow line and summits of the Rocky mountains, will probably be the established freight route.

NEW AGRICULTURAL IMPLEMENT.—English patents have been granted for improvements in agricultural apparatus for thinning turnips, or other roots or plants. In these the frame is supported on a pair of wheels fixed on an axle, and there is loose on the axle a bevel wheel which is in gear with a bevel wheel on the front end of a longitudinal shaft having fixed on its back end a wheel center on which the hoe or other thinning parts are fixed. A transverse bar is fixed on the underside of the frame, and carries a pair of paring coulters or small shares for paring or slicing the sides of the drill. The hake is fixed on one side, so that the horse may walk along the furrow on one side of the drill that is being thinned, and the haulers are also set to the same side, so that the agriculturist may follow in the same furrow. A light wheel is fixed adjustably to one of the handle bars to regulate the depth at which the thinners work.

Eberhardt & Aurora Mines.

Through the courtesy of Capt. Frank Drake, Manager of the Eberhardt & Aurora, we were enabled to visit Treasure Hill in his company. It being our purpose to view the workings of the mines belonging to the company, we were taken in tow by Mr. Maxwell, the obliging mine superintendent, and escorted underground, by way of the Earl and Dn Pas chambers, to the present scene of operations in the Peerless chamber. Since our last visit of some three months ago, the magnificent body of ore contained within the walls of this celebrated locality, has continued to yield abundantly, and, as yet, show no signs of diminution. Standing on the floor of this immense excavation one is lost in amazement while speculating on the everywhere visible amount of rich rock still remaining, after months of constant work, and conjecture fails to limit the quantity yet in sight. On the western side of this chamber the foot-wall has been reached and shows itself a distance of two hundred feet, as smooth as glass, lying at an angle of some thirty or forty degrees, pitching east. Taking into consideration the fact that the same character of wall is found in the Wheeler tunnel, of the Hidden Treasure, having the same inclination of pitch, then again seen in the Ward Beeber, north of the Peerless chamber, one cannot but arrive logically at the conclusion that the permanent wealth in mineral lies east of Treasure City, and that the ore found on Chloride flat and vicinity is not indicative of large and continuous bodies. The daily shipment of rock from the chamber described is from thirty-five to forty tons, supplying the thirty-stamp mill of the company, at Eberhardt, with a sufficiency of ore to keep the stamps constantly in motion.

Recent developments in the near vicinity of the famous chamber have demonstrated a very important fact of which we are not now at liberty to speak, but we can confidently predict a sensation in mining circles from the discovery ere many weeks. Manager Drake has been laboring under many difficulties since his assumption of the charge of affairs, foremost among which has been the lack of necessary funds with which to prosecute work as he would have desired, but, we are glad to say, that, through his energy and perseverance, the successful completion of the mill has been accomplished, and the expenses in its construction, as well as labor on the mines, will soon be liquidated. In fact he has made the property a self-sustaining institution from the start. We trust the directors, across the water, may see the necessity of allowing Capt. Drake to manage the mine as he proposes and we can confidently guarantee a perfect success. Prospecting is needed, and, at this time, with the knowledge obtained by actual exploration, but a short time will elapse before a second Eberhardt, in both richness of ore and extent will be found and make our English cousins dance with joy.

We do not write thus for "buncomb," but from a firm conviction and absolute belief in the state of facts as they exist. It has been our aim to tell only that we know from personal observation, and, from the start, we have predicted a glorious future for much abused Treasure Hill. It is only a question of time, short at that, when our camp, now so dull and deserted looking, will "loom up" as it deserves, and take its place among the very best mining sections of the known world; and to those who have clung to White Pine through all the years of apparent decay will be due the praise for persistency and faith, and their reward will be certain. We shall be furnished with accurate information of the new developments in the mines of the Eberhardt & Aurora Company when "assurance becomes doubly sure" of the extent of the rumored strike.—*White Pine News*.

IMPORTANT ORDER FROM WASHINGTON.—One of the regulations of the Treasury Department provides that all importations of coal and salt shall be weighed in official tubs at the time of discharge, that the Government may not be defrauded out of any legitimate revenue. Some years ago the importers conceived a strong prejudice against this law, because of the trouble it imposed upon them, and, through official sources, obtained a kind of agreed modification whereby cargoes of coal and salt could be loaded in bulk and so weighed. That is, the importers or purchasers were allowed to send carts to wharves and remove the coal and salt, by the load, to scales in various portions of the city, where it could be weighed by employes of said importers or purchasers. The United States weighers were then supposed to accept the figures of the private weighers as strictly accurate. This practice has obtained ever since its inauguration, and, of course, has worked like a charm for importers or purchasers. There has been shortage in numberless cases, and every discrepancy has been a loss to the Government. Some cargoes have fallen short hundreds of tons. Special Agent Vernon observed that importations of coal and salt were made in direct violation of the law, and so notified the Secretary of the Treasury. And now comes an order from Washington to have the coal and salt weighed in regulation tubs, as the law provides. The order will be carried into effect as soon as practicable. The importers will not be pleased to learn of this change.—*Bulletin*.

About one hundred and twenty car loads of ore are now daily shipped from the Constock to mills on the Carson river, and at Silver City.

North Idaho.

From all the reports received from North Idaho of late, the value of that country is becoming more generally appreciated than heretofore. Formerly it was supposed that the placer mines would soon be worked out, and that then the country would be abandoned as of no further value. But it now seems that if the mines were actually worked out, there is enough fine grazing and agricultural country to make it at some day a very rich and prosperous section of country. The advantages of soil and climate are already attracting many settlers, and there is now being laid the foundation for a permanent and prosperous agricultural and stock-raising community. But the supposition that the placer mines would soon be worked out is also unfounded. For twelve years they have been worked, and still there is a considerable yield of gold from these placers. They are not so rich as when first discovered, but may, and probably will, pay wages for the working for many years to come. But in addition to these, the quartz mines of that section are beginning to attract attention, and will soon, we believe, be extensively and profitably worked. The country in places seems to be a perfect net work of quartz ledges; and those that have been fairly tested, have yielded good returns. There are quartz mills now in the mines that have crushed ore sufficient to show that these mines are rich; and so far as that is concerned, no one seems to doubt it. One reason why these mines have not been worked more extensively, is that they are difficult of access at all times, and especially so in the winter. This, however, is a difficulty that can be overcome, and no doubt soon will be. When this is done, and when these quartz mines become developed, and their richness and productiveness known, then the real value of North Idaho as a mining country will begin to be appreciated. This, added to the other advantages which she possesses, will make her of no little importance in a few years at furthest.—*Walla Walla Union*.

PASSEN THROUGH.—We met Mr. Kimball, a gentleman from San Francisco, to assume charge of the fine 20-stamp mill at Egan Canon. He precedes J. R. Murphy but a few days and will at once get matters in shape to commence work with vigor. We are informed by the gentleman mentioned that Mr. Murphy, accompanied by Mr. Taylor, of the London firm of Taylor & Sons, large operators in mines and mining, and connected with the property at Mineral Hill, will arrive this morning from below. It is in view to look at the prospects of Cherry Creek and report upon them. We trust the parties mentioned may be satisfied of the advisability of investing in the new camp, as men of their stamp do much toward bringing out a country. The present inclement season of the year, we fear, may operate to the disadvantage of the district, but we hope for better weather soon, which will place a different aspect on matters generally.—*White Pine News*.

MINT CRAZY.—The American people are seemingly getting crazy in regard to the mints—not mint-jinlepe, nor "mint-drops," but the establishments that turn out the "drops." Every mining locality, almost, wants a mint. We have one at Carson to accommodate the miners of Nevada and Utah. Montana has for some time past been asking for a mint establishment, and now comes Salt Lake City with a demand for a like institution. As soon as Alpine leaves off her swaddling clothes we had better ask for a mint for Silver Mountain. And, we had forgotten, Chicago wants one, and if her wants are supplied her rival, St. Louis, will want one. Our people are continually growling about high taxes and foolish expenditures of the public money, and at the same time they ask Congress to spend some five or six millions of dollars to establish mints when the mints we now have fully meet the wants of the country.—*Alpine Chronicle*.

AMERICAN FLAG MILL.—The American Flag mill has just finished making thorough repairs, and is prepared to do the best of work. A new dry kiln, twenty-one feet square, has been built, provided with two furnaces, which dries the ore quickly and thoroughly. The capacity of the mill is thus much increased. The mill has always done satisfactory work; and, with increased facilities, must still retain the confidence of the public. The mill is now working ore from the Washington & Creole mine, and extracting eighty per cent. of the silver contained therein. A. G. Moore, the foreman of the mill, has had much experience in the treatment of ores in this camp, and understands the processes best adapted to obtain good results from the different classes and grades of ore the camp produces.—*Pioche Record*.

ABOUT THE YEAR 1300 coal was first discovered on the banks of the Tyne, and was introduced as fuel into London about the year 1350, in the reign of Edward I. Its use, however, was in 1373 forbidden by proclamation, in consequence of the gas being considered to be deleterious to health through corrupting the atmosphere, and for many years after it remained unused. At the close of the century, however, the value of coal became recognized, and its application and consumption extended.

The number of industrial establishments in France at present is 150,000, employing two million of hands and steam power equal to 650,000 horses. The business done amounts to twelve thousand millions of francs.

USEFUL INFORMATION.

New Dyeing Recipes.

Reimann's *Farber Zeitung* contains a recipe for a safflower rose on glazed calico. The dressing consists of 50 lbs. of wheat starch, 20 lbs. of wheat flour, 4 lbs. of white wax, and 6 lbs. of cocoa nut oil, a little sulphuric acid being added to the water in which the starch is mixed.

There are also recipes for light and deep Prussian blues on glazed calico; for a green (extracts of indigo and of quercitron) on jaconnet; a peach wood crimson on glazed calico and jaconnet; a brown on calico with Bismark brown and magenta; a gray drab on wool, and a scarlet on woolen cloth and flannel; also a blue (soluble aniline blue) and a coffee brown on plush; a violet on woolen yarn. The mordant in this case consists of $1\frac{1}{2}$ ozs. of tannic acid, dissolved in hot water in which $\frac{1}{4}$ oz. of Marseilles soap is next dissolved; $\frac{1}{4}$ oz. rapo oil is next added, and stirred up till it forms an emulsion. The liquid is used at 167° Fah. The bleached yarn is worked in this mordant for fifteen minutes, and then withdrawn. The color bath, at the same temperature, is prepared with 5 nzs. of alum and the clear solution of 1 oz. of methyl violet.

There is also a prescription for a light green on cotton yarn, the color being methyl green fixed with tannic acid.

The editor gives a recipe for a brown on shoddy containing a mixture of cotton, called on the continent *velour*. To 100 lbs. of this material, make up a bath of 30 lbs. of fustic, 3 lbs. of alum, 2 lbs. of prepared tartar, and 1 lb. of blue vitriol, in which the shoddy is boiled for half an hour. To the same lot are then added 1 lb. of chromate of potash and $\frac{1}{2}$ lb. of aniline red, ruby, or aniline crimson, known on the continent as *rossin*. The dyeing is carried on at a gentle boil, and turmeric added to modify the shade. Logwood may be used, if needful, to darken. Aniline is refuse magenta; it is dissolved in hydrochloric acid and boiled in water previous to use.—*Chemical News*.

VENEERS are readily dyed upon the surface, but in this condition are much more liable to disfigurement than when the color is made to permeate the mass. Those colored throughout are therefore the most sought after, and before the late war were chiefly furnished from Paris. During the war, the supply being cut off, some German cabinet-makers took up the subject, and, after numerous experiments, perfected a process which secures the desired result. The veneers are first soaked for 24 hours in a solution of caustic soda, and then boiled therein for half an hour. They are then washed with water until all the alkali is removed, when they are ready to receive the dye. This treatment with soda effects a general disintegration of the wood, whereby it becomes, in the moist state, elastic and leather-like, and prepared to absorb the color. Veneers thus treated, if left for 24 hours in a hot decoction of logwood, and, after superficial dyeing, immersed for 24 hours more in a hot solution of copperas, become of a beautiful and permanent black throughout. A solution of picric acid in water, with the addition of ammonia, gives a yellow color, not in the least affected by subsequent varnishing. Coralline dissolved in hot water, to which a little caustic soda and one-fifth its volume of soluble glass have been added, produces rose color of different shades, dependent on the amount of coralline taken. After dyeing, they are dried between sheets of paper and subjected to pressure to retain their shape.—*Manufacturer and Builder*.

CASTING NICKEL.—Nickel can be cast; it is now done in Berlin, Prussia, where nickel plates of 16 inches square and $\frac{1}{4}$ inch thick are made from the ordinary small cubes under which it comes in the trade. The way to do it is to place the nickel in crucibles in the ordinary furnaces used in brass foundries, but the melting requires a constant and careful watchfulness, while a proper liquid condition is only attained after a heat of at least six hours. As soon as it flows it must at once be cast in sand molds, because if allowed to cool in the least it will at once form a compact lump, which it is impossible to melt again in any ordinary smelting furnace. Such a very large cast of nickel plates were to be seen at the late Vienna exhibition. They are of course very useful for nickel-platers.—*Manufacturer & Builder*.

A USEFUL DEVICE.—A tin tube made like a siphon, driven into the vent of a barrel of wine or cider, and the other end inserted into a vial of water, will prevent the air from entering the barrel, while the gas escapes through the water. Make the barrel otherwise tight. When the cider or wine is done working, the water in the bottle will cease bubbling. It requires no filling up, as there is no loss.—*Boston Journal of Chemistry*.

DETECTION OF ADULTERATION IN COFFEE.—In order to ascertain whether ground coffee has been mixed with either roasted corn or amylaceous substances generally, it is only necessary to treat the powder, first with dilute caustic potassa, and after filtration and addition of a large quantity of pure water, a solution of iodine is added, whereby the starch is detected.—*Dingler*.

Gluing the Ends of Leather Belts.

The first requisita in naiting leather belts with glue is to drass off each piece at a true taper, for a distanca equal to the width of the belt. The two pieces should be made to fit as nearly as two pieces of planed boards when dressed with a jointer. Now, procure some glue of the very best quality, and prepare it the same as for gluing pieces of wood together. Then, let the leather be warmed, lay on the glue quickly while it is hot, and apply pressure with a vise or hand screw. In lieu of either of these appliances, place the leather between two pieces of plank, put two carriage-bolts through them, screw them up tightly, and let it remain in the clamp until the glue is thoroughly hardened.

We have united leather belts with glue of a common quality, which were in use for several years; and the glued joints did not separate until the leather was allowed to get wet.

An exchange contains the following directions for making a cement for uniting leather belts: Mix ten parts of sulphide with one oil of turpentine, and then add enough gntta percha to make a tough, thickly-flowing liquid. One essential requisite to a thorough union of the parts consists in freedom of the surface to be joined from grease. This may be accomplished by laying a cloth upon them and applying a hot iron for a time. The cement is then applied to both pieces, the surfaces brought in contact, and pressure applied until the joint is dry.—*Ex.*

UTILIZATION OF GAS LIME.—An English engineer claims to have discovered that the waste lime from gas purifiers, hitherto considered as almost useless refuse, may be used to great advantage in the manufacture of mortar, beton, and concrete. He states that it is simply requisite to grind it up in the usual mortar mill or to mix it as ordinary lime with sand, ashes, and similar material. When used in making concrete or beton, the lime may or may not, as required, be moulded into bricks or flags in the ordinary manner. The addition of Portland cement to the mixture is said to render the product much harder. This use of gas lime has been patented in England by the inventor, Mr. Humphrey Chamberlain Round, Green Barnsley, York.

PENPANS the item in which method brings the largest returns is that of keeping machinery in constant use. Not only by this means is its usual profit obtained, and the interest on its first cost saved, but the mechanism, if kept in good repair, will last much longer; for it is well known that when in daily operation, a machine, like an engine-lathe, will deteriorate but one-half as fast as when entirely idle. This should be kept in mind when selecting for manufacture a line of staple articles; that which will keep the machinery running regularly throughout the year, other things being equal, pays a better interest on time, money, and labor than that which for any cause must be allowed to stand idle at intervals.—*American Car Builder*.

DETERMINATION OF WATER IN ESSENTIAL OILS.—All the volatile oils distilled from vegetable matter may contain water even when perfectly free from turbidity. If to samples of such oils several times their volume be added of petroleum ether (light petroleum spirit), a turbidity arises from drops of water which are separated out, and which appears the denser the larger is the proportion of water present. The following oils were thus found to contain water:—Lavender, clove, spike, cinnamon, rosemary, sassafras, juniper, and bergamot. Traces of water were found in neroli and oil of *Gaultheria procumbens*. Turpentine, cedar, citron, rue, and amber were free from water.

DENTIST'S SOLDERS.—For gold solder, use 8 grains American silver coin and 4 grains best copper wire (or copper from an old style cent) to each pennyweight of gold plate of the same fineness as that to be soldered. For silver, use 8 grains best brass wire to each pennyweight of silver coin. Melt with borax, cool, and roll into plate.—*Scientific American*.

INCREASING THE FELTING PROPERTY OF HATS BY THE USE OF CHEMICALS.—According to *Reimann's Farber Zeitung*, a mixture of nitric acid and treacle is now proposed as a substitute for the use of mercury dissolved in nitric acid, formerly employed for enhancing the felting properties of rabbit's hair in the manufacture of felt hats.

IMPROVED DRAWING INK.—The addition of one part of carbolic acid to 80 parts of the fluid India ink, while it does not impair its fluidity, causes it to dry rapidly even in heavy lines, so that they can be varnished over. The proper amount of carbolic acid to be added in any case may be ascertained by adding drop by drop, the ordinary apothecary's solution of it in alcohol until varnishing does not effect the definition of a test line by causing it to run. The addition of too much carbolic acid is indicated by the transparency of the line and the inability to draw fine lines, a condition which may be easily remedied by the addition of more of the fluid ink.

DANDREFF can be removed by washing the head with buttermilk and thoroughly cleansing with pure soft water afterwards.

GOOD HEALTH.

Hints for Nurses.

The following sensible suggestions are from the pen of Florence Nightingale: "Conciseness and decision are, above all things, necessary with the sick. Let your thought expressed to them be concisely and decidedly expressed. What doubt and hesitation there may be in your own mind must never be communicated to theirs, not even (I would rather say especially not) in little things. Let your doubt be to yourself, your decision to them. People who think outside their heads, the whole process of whose thought appears, like Homer's, in the act of secretion, who tell everything that ed them towards this conclusion and away from that, ought never to be with the sick.

Irresolution is what all patients most dread. Rather than meet this in others, they will collect all their data and make up their minds for themselves. A change of mind in others, whether it is regarding an operation, or rewriting a letter, always injures the patient more than the being called upon to make up his mind to the most dreaded or difficult decision. Further than this, in very many cases, the imagination in disease is far more active and vivid than it is in health. If you propose to the patient change of air to one place one year, and to another the next, he has, in each case, immediately constituted himself in imagination, the tenant of the place, gone over the whole premises in idea, and you have tired him as much by displacing his imagination, as if you had actually carried him over both places.

Above all, leave the sick room quickly, and come into it quickly, not suddenly—not with a rush—but don't let the patient he wearily waiting for when you will be out of the room, or when you will be in it. Conciseness and decision in your movements, as well as your words, are necessary in the sick room, as necessary of absence of hurry and bustle. To possess yourself entirely will insure you from either failing, either loitering or hurrying.

If a patient has to see, not only to his own, but also to his nurse's punctuality, or perseverance, or readiness, or calmness, to any or all of these things, he is far better without that nurse than with her, however valuable and handy her services may otherwise be to him, and however incapable he may be of rendering them to himself.

THE PULSE.—The pulse of a healthful grown person beats seventy times in a minute; there may he good health down to sixty; but if the pulse always exceeds seventy, there is a disease—the machine is working too fast; it is wearing itself out; there is a fever or inflammation somewhere, and the body is feeding on itself, as in consumption, when the pulse is quick, that is, over seventy, gradually increasing with decreased chances of cure, until it reaches one hundred and ten or one hundred and twenty, when death comes before many days. When the pulse is over seventy for months, and if there is a slight cough, the lungs are affected. Every intelligent person owes it to himself to learn from his family physician how to ascertain the pulse in health; then by comparing it with what it is when ailing, he may have some idea of the urgency of his case, and it will be an important guide to the physician. Parents should know the healthy pulse of each child, as now and then a person is born with a peculiarly slow or fast pulse, and the very case in hand may be that peculiarity. An infant's pulse is one hundred and forty; a child of seven, about eighty; and from twenty to sixty years it is seventy beats a minute, declining to sixty at four score. There are pulses all over the body, but where there are only skin and bone, as at the temples, it is most easily felt.—*Home and Health*.

DOCTORS AND MEDICINES.—A Chicago man says: "We are told that doctors never take medicine of their own or of any one else's recommending. I was reminded of this a few months ago. I went into the office of one of Chicago's most celebrated physicians to obtain a prescription for a cold and hoarseness. While he was writing it out he casually mentioned that, having been out in the terrible storm of the previous day, a severe cold had resulted, and that in the morning he could scarcely speak aloud. As I folded the prescription—which was Egyptian to me, but seems to be the mother tongue of druggists—I ventured to inquire what he had taken for his hoarseness. 'Loaf sugar and lemons,' was the placid reply. Well, that prescription for drugs was never used, and I found 'loaf sugar and lemons' excellent."

TO REMOVE ADHESIVE PLASTER.—Every surgeon, doubtless, is familiar with the appearance of a part which has been enveloped in adhesive plaster, after the straps have been removed. The appearance is not one in very good keeping with a cleanly and neat surgical dressing. The portion of the plaster which is left adhering to the skin may be quickly and completely removed by the use of oil of turpentine and sweet oil. Use a little more than half turpentine. This compound, carefully rubbed over the parts with a bit of cloth or sponge, and then washed off with warm soapsuds, will leave the surface as clean as nature ever intended.—*Exchange*.

COFFEE WATER AS A REMEDY FOR GOUT.—Dr. Monchaux, in the *Revue de Therapeutique*, gives the following: Put a tablespoonful of green—that is, unroasted—coffee in a half a tumbler of pure water, at the temperature of the surrounding air, and after allowing it to stand for twenty-four hours, drink off the liquid immediately upon getting up in the morning. Fill the glass with water again as before, and again drink the liquid as before, so that the same coffee serves twice. The liquid obtained is of a green color, more or less tinged with blue, according to the kind of coffee used. I do not, know the chemical composition of the water, but the grains well considerably, and sometimes sprout, throwing off little bubbles of gas, which I suppose to be carbonic acid. I have not observed very long relative to this remedy upon the uric acid diathesis. If I am to give an opinion upon it, I am at present inclined to think that it attacks rather the effects of the maldy than the disease itself, suppressing the former from day to day, if I may so express myself, while the latter remains. It will be, therefore, necessary to continue the daily use of the remedy as above.

POTATOES PROSCRIBED.—Several German writers upon races predict that nations, far from improving, will deteriorate both in physical and mental characteristics, if potatoes become a principal article of diet. The celebrated Carl Voigt says that "the nonriehing potato does not restore the wasted tissues, but makes our proletariats physically and mentally weak." The Holland physiologist, Mulder, gives the same judgment when he declares that the excessive use of potatoes among the poorer classes and coffee and tea by the higher ranks, is the cause of the indolence of nations. Leidenfrost maintains that the revolutions of the last three centuries have been caused by the changed nourishment; the lowest workman, in former times, ate more flesh than now, when the cheap potato forms his principal subsistence, but gives him no muscular or nervous strength.

FOON MEDICINE.—Dr. Hall relates the case of a man who was cured of his hilloousness by 'oing without his supper and drinking freely of lemonade. Every morning, says the Doctor, this patient arose with a wonderful sense of rest and refreshment, and feeling as though the blood had been literally washed, cleansed and cooled by the lemonade and fast. His theory is that food can be used as a remedy for many diseases successfully. As an example, he cures spitting of the blood by the use of salt; epilepsy by watermelons; kidney affections by celery; poison, olive or sweet oil; erysipelas, pouched cranberries applied to the part affected; hydrophobia, onions, etc. So the way to keep in good health is really to know what to eat—not to know what medicines to take.

DANGER FROM WET CLOTHES.—Few persons understand fully the reason why wet clothes exert such a chilling influence. It is simply this: Water, when it evaporates, carries off an enormous amount of heat in what is called the latent form. One pound of water in vapor contains as much heat as nine or ten pounds of liquid water, and all this heat must, of course, be taken from the body. If our clothes are moistened with three pounds of water—that is, if by wetting they are rendered three pounds heavier, these three pounds will in drying, carry off as much heat as would raise three gallons of ice-cold water to the boiling point. No wonder damp clothes chill us.

FEVER AND AGUE PROPHYLACTIC.—We hear that several of the officers upon Sir Garnet Wolseley's staff provided themselves before starting with the prescription for bilious remittent fever so strongly recommended by Dr. Livingstone. It will perhaps be remembered that in his interesting volume on the Zambesi expedition, the Doctor published the ingredients of a pill which was found to be of the greatest service to every one accompanying him. The formula includes resin of jalap, powdered rhubarb, quinine and calomel, and was always administered previous to the employment of quinine.

CHAPPED HANDS.—The easiest and simplest remedy is found in every storeroom. Take common starch and grind it with a knife until it is reduced to the smoothest powder. Take a clean box and fill it with starch thus prepared, so as to have it continually at hand for use. Every time hands are taken from the suds or dishwater, wipe them, and, while they are yet damp, rub a portion of starch thoroughly over them, covering the whole surface. The effect is magical. The rough, smarting skin is cooled and healed bringing and insuring the greatest degree of comfort and freedom, from this by no means insignificant trial.—*Artisan*.

TO STOP BLEEDING AT THE NOSE.—It is worth while to know how to stop the bleeding from the nose when it becomes excessive. If the finger is pressed firmly upon the little artery that supplies the blood to the side of the face affected, the result is accomplished. The two small arteries branching up from the main arteries on each side of the neck, and passing over the outside of the jawbone, supply the face with blood. If the nose bleeds from the right nostril, for example, pass the finger along the edge of the right jaw till the beating of the artery is felt. Press hard upon it, and the bleeding will cease. Continue the pressure five minutes, until the ruptured vessels in the nose have time to contract.

Suggestions to Prospecting; Tin Mining in Banca; Western Australian Mines; A Tiny Engine; Klamath County Mines; The Sticken Mines, 90. New Gravel Mill; Rye Patch Items; The White Pine Tunnel; Hydraulicking in Montana; Counties of California; Zinc Mines, 91.

New Imitation of Silver.

In the *Scientific American* of January 24, is described a patented process for obtaining a metallic alloy which resembles silver better than any substance yet known, with respect to color, specific gravity, malleability, ductility, sound and other characteristics. The new alloy is a compound of copper, nickel, tin, zinc, cobalt and iron. If this new metal is as perfect as represented, there may be a good chance for coin-counterfeiting, etc., to start a flourishing business in making trade dollars, halves, quarters, etc. We had a call this week from a distinguished personage in this city, whose authority and influence is well known to members of our community. He thinks the metal referred to should not be made, and has therefore issued the following

Proclamation:

Fearing that the granting of a patent for the imitation of silver such as mentioned in the *Scientific American* of the 24th day of January, 1874, may lead to endless frauds in the silver currency of the country, now, therefore, we, NORTON I. DE GRATIA Emperor of the United States and Protector of Mexico, do hereby command the Commissioner of Patents to cancel the said patent, and declare the manufacture of such a metal a penal offence.

NORTON I.

Given in San Francisco, California, this 3d day of February, 1874.

AMERICAN IRON AND STEEL.—The American iron and steel convention met at Philadelphia, on the 4th instant. The report of the Secretary says it is the plain duty of Congress to repeal the Act of 1872, requiring a duty of ten per cent. on iron. The general iron trade of the country is pronounced to be but little better than at the beginning of the panic. Returns show that out of fifty rail mills only twenty-one are working. Of 385 foundries, 138 are idle. The stock of iron on hand is 308,000 tons, and over 12,000 hands are unemployed.

The Price of Quicksilver.

Mr. Gilman of Calaveras county has introduced in the assembly a bill to regulate the price of quicksilver in California. It provides that the maximum price at the mines and reduction works shall not exceed 35 cents per pound. In San Francisco, Sacramento, Oakland, San José, Santa Clara, Vallejo, Napa, Los Angeles and San Diego, the maximum price is fixed at forty cents per pound. At all other localities, the vendors of this commodity are allowed to sell it at the San Francisco price, with the cost of transportation added. This is the substance of the bill.

Mr. Gilman is from a mining county and no doubt has the interests of the miners at heart, but his method of reducing the price of quicksilver is utterly impracticable—not to say nonsensical. Reforms in politics, railroad management, etc., are all very well, but what authority the Legislature has to meddle with the rights of private parties, we fail to see. These quicksilver men are real producers and have as much moral and legal right to charge as much as they can get for their quicksilver as the farmers have to get as much as possible for their grain. The legislature would have as much authority to regulate the price of wheat because poor people could not afford to pay high prices for flour, as they have to regulate the price of quicksilver.

The "quicksilver monopoly" of three or four mines was broken up entirely last year through force of circumstances. A large number of new mines were discovered and worked in California, which could, and did, undersell the monopoly until it no longer had any power. The price is now regulated by the well known laws of supply and demand. The increased demand for the large number of new gold and silver mines on the coast and the decreased supply from the principal quicksilver mines, raised the price of quicksilver as a natural consequence. The New Almaden mine, which produced 18,763 flasks of quicksilver in 1871 and 17,753 flasks in 1872, only produced 12,000 this year. The New Idria, which produced 8,597 flasks in 1872, produced but 7,600 in 1873. The total production for the year showed a falling off of nearly 2,000 flasks of quicksilver. Nearly all of what has been produced in California has been needed here on this coast. We exported in 1868 over 44,000 flasks and in 1872 only 13,093, while in 1873 the exports only amounted to 6,359 flasks. When we remember that the Almaden used to produce 3,500 flasks per month, and now only produces 1,000, it will be easily understood that that fact makes a considerable difference in price, especially as the demand has increased as the supply has decreased.

Now we know very well that the present price of quicksilver is an exorbitantly high one and its continuance will work great injury to the mining interests; but, candidly, how can we blame the mine owners for getting as much as possible for their metal? They do the same kind of a business as other people; that is, they want to make money, and if they can get \$1.25 per pound for an article, they will not sell it for 40 cents. Such a bill as the one referred to would not prevent this at all. If the bill became a law it could of course only apply to California and would do more harm than good to the State. Nevada is estimated to consume alone 1,100,000 pounds per annum, and as the law would not apply there, all the quicksilver would be sent to that State, sold there at the present high prices and the California miners would have to pay in addition to the price, what it cost to be taken there and back. Or if the quicksilver men could be compelled to sell here for 35 or 40 cents per pound after it came back, they would block that game by not selling any in California at all.

In fact we do not believe that any such law could stand even if it passed, and if it did stand it would be a dead letter. Did Mr. Gilman even inquire how much it cost to produce a pound of quicksilver? Take into consideration the cost of furnaces and the equipment of a mine, working on one two or three per cent. ore, and at 35 cents per pound for quicksilver, how much profit would these men get? They would shut down their mines until the law was repealed. The whole bill is so ridiculous that we begin to think that typographical errors must have crept into it in giving the figures to which the price is limited. At all events the originator of the bill must have had an exaggerated idea of the profits of the quicksilver business. Perhaps he thinks the price the product brings is all profit.

Quicksilver is bound to remain where it is, or go even higher, unless there are more mines opened and a greater production. There is not the least doubt as to that proposition. The quartz and gravel mines must have it if they have to pay \$2.50 per pound, and the quicksilver men know that as well as the miners. If there were more quicksilver mines producing, there would be a greater supply, more competition and a consequent reduction of price, and until that happens we must pay for it what the laws of trade demand.

We do not wish it to be inferred from these remarks that we believe quicksilver should be as high as it is, but that bills of the kind referred to are not only unjust, but impracticable. There is a better way to reduce the price than this. Let some of our California street men, interested in mining, help along the poor proprietors in Napa, Sonoma, Monterey, San Luis Obispo, Solano, Lake, San Bernardino

and other counties of California. Let them take hold of some of the many claims and develop them. Let them lend the aid of their capital to the labor of these poor miners to open up their claims. Let some of the big quartz mines, as a Virginia City cotemporary has suggested, buy and work their own quicksilver mines. There are plenty of them all over the State only needing capital to develop them. Keep some little capital from quartz and put it into cinnabar. If this is done for a year or so and some of the many promising deposits discovered during the past year, properly prospected and developed, quicksilver will come down of its own accord without any foolish and unjust legislation.

Mining Legislation.

We notice that a meeting of the miners of Railroad Mining District, Elko county, Nevada, was held on the 26th ult., at which they passed a series of resolutions condemning Senator Sargent for the proposed amendment to the mining laws, and also for having drawn up the mining law of May 10th, 1872. We quote the preamble and one of the resolutions as follows:

WHEREAS, The Congress of the United States, on May 10, 1872, having passed a number of laws to govern mining locations, which seem to be made entirely in the interest of monopolies and capitalists, at the instigation of Congressman Sargent and his friends, and to the detriment and almost ruin of the ordinary miners and prospectors, who are the discoverers and men who develop the mines and mineral resources of the country, and to whom the country is entirely indebted for its vast and rich mining districts; and

WHEREAS, The same Sargent is now attempting to pass through Congress another, entitled "A Bill supplemental and amendatory to the Act entitled an Act to promote the development of the mining resources of the United States, approved May 10, 1872," which amendatory Act requires that all persons owning or claiming lodes upon the public domain shall, within one year after the passage of this amendment, do at least five hundred dollars worth of improvement upon each and every location and apply for a patent; therefore

Resolved, We pronounce the last amendment, as introduced by Sargent, an infamous outrage upon the entire number of men who are engaged in prospecting and developing the mineral resources of the United States, and that not one miner or prospector in one hundred can comply with said Act; and in consequence thereof will be compelled to abandon all claims held by them.

The miners who passed these resolutions were somewhat hasty in their action. Mr. Sargent has not introduced any such bill, but Mr. J. D. Ward of Chicago has done so. We commented on Mr. Ward's bill in a recent issue of the PRESS, and give Mr. Sargent's bill in this issue. The two bills are entirely different. The California delegation, including Mr. Sargent, are reported as being strongly against Ward's bill which provides that parties must expend \$500 on each claim, and procure a patent within one year.

The bill is an outrageous one, but the odium of its introduction should rest where it belongs, and the miners of Railroad District, before they poured out "the vials of their wrath," should have looked out where the contents lodged. Sargent is "pitched into" enough for things he does, without being abused about measures opposed by him. We do not believe Ward's bill will ever become a law, for it is only one of the many plans to pay the national debt. As it would ruin the mining interests of the coast, for a time at least, Congress will hardly dare to pass so outrageous an Act.

ACTIVE PREPARATIONS FOR MINING.—Active preparations are at present being made in all directions in this section of the State, says the *Territorial Enterprise*, for the opening and development of mines along the Comstock. More work will be done at the north end of the Comstock than ever before, and if no other good shall result, this work will at least serve to trace the lead and give our people more clearly defined ideas than they now possess in regard to where the great lode may run after passing to the northward beyond the Ophir. If the lead continue north it will be found, and if not its absence will be very likely to be ascertained. To the southward a great number of companies are busily engaged in making preparations for active operations early this spring. Many of these companies will erect powerful and substantial hoisting works and prospect their ground in a most thorough and workmanlike manner, and (where so many are deeply delving) we may reasonably hope to hear of some among them making valuable discoveries. In a thoroughly mineral country—one in which the digging of a cellar is liable to lay bare some treasure, in the store-house of nature—no work undertaken for the exploration of the bowels of the earth should be looked upon with disfavor or discouraged. No doubt not a few of these works are undertaken for speculative purposes, most of the originators intending to sell out as soon as they shall be able to obtain a fair price for their shares, still, as far as the country is explored, the shafts sunk and the drifts and tunnels run are valuable. So great is the number of shafts sunk and being sunk, and so great is the length of the tunnels run and running, below Gold Hill, that the mystery regarding the direction of the Comstock in that region must soon be solved, as all the ground will be dug over ere long.

THE Camp Floyd mine is still waiting for the promised funds from England, but Mr. Sewell keeps the mill running right along.

A Growing Institution.

The California Academy of Sciences, which has for a number of years been struggling for existence against adverse circumstances, is now in a very prosperous condition. They removed from their old and dingy quarters on Clay street, last month, and now occupy the building on the corner of California and Dupont streets, which was formerly the First Congregational Church. The body of the church is used as a place of meeting, a platform for the President, Secretary, etc., having been erected over the pulpit. The gallery has been remodeled, the benches removed, the floor leveled up and the mineralogical specimens of the Academy are now displayed there. Additional cases are being constructed, to be placed around the gallery, in which will be exhibited other interesting objects from the Academy's museum. The basement of the church has also been put in order and renovated. The lecture room is now used as a library and museum. Another room has been fitted up neatly for Trustees and Secretary. A working room for the Curators has also been set apart. Another apartment is used to keep the publications of the Academy and specimens not prepared for exhibition. The long room under the entrance to the church is used for displaying the alcoholic specimens, which are arranged on shelves on both sides of the room. Altogether, the new quarters are very comfortable and commodious, and afford an opportunity for displaying the interesting and instructive collections of the Academy.

The church has only been rented temporarily, until such time as they can enter the proposed new building on Market street. It has been secured for a monthly rental of \$250 from H. M. Newhall, who donates to the Academy \$100 per month as long as they occupy it, making the actual rent only \$150 per month. This generous action of Mr. Newhall is much to be commended, and is even more appreciated when it is understood that he refused \$400 per month rent from Chinamen, who desired to secure the place.

Altogether, the Academy has been in luck for the past year. The munificence and liberality of James Lick has placed it on a permanent footing, and one which will make it a credit to the city and State. His first gift was a lot of land on Market street, near Fourth, worth about \$250,000. He then decided to erect the mammoth Observatory on the Sierras, of which we have before spoken, and will appoint the Academy of Sciences as trustee for its management. He then allowed the President of the Academy to make public the fact that he intended to erect the building on the lot on Market street with his own money. Moreover, he has announced his intention of endowing the institution with sufficient funds to make it a first-class and self-sustaining one. The building itself will cost some \$250,000, if built according to Mr. Lick's plans. It will be seen from this that the future prospects of the Academy are bright, indeed, and that we have on our coast at least one individual who has an appreciation of scientific research sufficient to cause him to assist it in a most liberal and practical manner.

Including all classes of members the Academy has now a membership of 472, and the list is continually increasing. Some 30 life members were elected last year, who pay \$100 each for that privilege. The published proceedings of the Academy, which show more than anything else what work is being done, are in very good repute abroad. The volume printed last year contained 243 pages of printed matter and a number of engravings. The field for original scientific investigations on this coast is large and the size of the Academy's last volume shows that it has not been neglected. Much interest is manifested in the proceedings of the Academy and the increased attendance during the past year necessitated the removal to more commodious quarters. The curators are now busy in arranging and classifying the museum material, and even now quite a creditable collection is displayed. As soon as the necessary cases are made, the wall room of the church will be entirely filled and the collection will be well worth a visit. Most of the objects are of Pacific Coast origin and many of them of new species or varieties, rendering them doubly interesting.

A POCHEE COLLECTOR.—A miner from Pioche named John O'Malley has attempted to collect a debt in this city in the manner in vogue in Pioche. From his account it seems that he had been employed at the Raymond & Ely mine once, that he gave J. B. E. Cavallier, a broker of this city, the sum of \$1,740 to invest in stocks for him. Cavallier afterwards suspended payment and O'Malley was out and injured. Cavallier, however, promised to pay the gentleman from Pioche but failed to do so. On Wednesday of this week the parties met on Kearny St. and Cavallier offered O'Malley \$250, which he refused to take. They had some words, when the miner drew his revolver and fired two shots, breaking some plate glass windows and frightening some milliners in an adjacent store, but no one was injured. Cavallier is such a bulky man and judging from the reputation of the residents of Pioche as marksmen, Mr. O'Malley has not lived there very long or he would have had more practice. Probably he was so frightened at breaking a large plate glass instead of only hitting a man that his second shot was no truer than his first. Mr. O'Malley now languishes in jail.

Sargent's Mineral Land Bill.

The Mineral Land Bills of both Sargent and Ward now pending in Congress are exciting much discussion and comment on this Coast, where we are more directly interested. The miners agree in condemning both the bills. That of Ward of Chicago, compelling miners to pay \$10 per acre, to which we have before referred, is even opposed by our California delegation in Congress. The miners everywhere denounce it as outrageous.

Concerning Sargent's Bill, on the 31st inst., the Commissioner of the Land Office wrote to the House Committee on Mines and Mining, recommending that Sargent's bill authorizing joint entries and fixing a uniform price for both agricultural and placer mineral lands, be so amended as to confine it to what is commonly known and designated as placer mining land, as contra-distinguished from lands containing quartz or lands bearing gold, silver, copper or other valuable minerals, or lands containing coal. The Commissioner also recommends a proviso that nothing contained in that bill shall authorize any person or company to locate more than 160 acres as a mining claim.

The following is the full text of the amended bill as telegraphed to this coast:

Be it enacted by the Senate and House of Representatives of the United States in Congress assembled, that the public lands in the State of California, other than those containing veins or lodes of quartz or other rock in place, bearing gold, silver, lead, tin, copper, or other valuable minerals, or lands containing coal, shall not be excluded as mineral lands from pre-emption or homestead entry, unless it shall be shown that bona fide mining claims exist thereon, or that the land is necessary for the outlet of other mining easements. Permits of railroad grants shall be \$1.25 per acre; provided that nothing herein contained shall be construed to change any preemption now existing, either by law or departmental regulation, that lands within the railroad grants are mineral in character.

Section 2 provides that where two or more settlers have improved on the same legal subdivision, whether agricultural or placer mining, or both, it shall be lawful for each settler to make joint entry of their lands at the local land office, or for either of said settlers to enter into a contract with his co-settlers to convey to them their portion of said land after the patent is issued to him, and after making such a contract to file an application for such land in such manner and to the same effect as provided by law for agricultural settlers upon the same legal subdivision, provided that proof of the improvement under the mining rules of the portion of said land claimed as a mining claim may be made in said proceedings by the applicant, as now provided by law, and notice of said application where a patent of a mining claim is sought shall be given and have the same effect as is now provided in the case, the same as if it were an application for a mining claim.

Section 3 provides that in case where placer mining claims are only located under the mining law, it shall be lawful for parties applying for a patent for the same to make their application to purchase lands to the extent of the smallest legal subdivision containing said claims, when such applications do not conflict with the rights of other parties, and the patent shall issue accordingly; provided, that nothing herein contained shall authorize any person or company to locate more than 160 acres as mining claims.

Section 4 provides that all affidavits and proofs required by law may be made before any local officer in mining or pre-emption cases, may be taken before any officer authorized to administer oaths, and when filed with the Register and Receiver shall have the same effect as if taken before the officers. Effect shall be given to this Act by regulations to be prescribed by the Commissioner-General of the Land Office, provided that when such affidavits or proofs are taken at any place other than with the land list, it shall be by the Clerk of any Court of Record in the United States.

WATER RIGHTS.—A practice has grown up in California regarding water rights different from anywhere else in the world—that is, of allowing persons, upon giving certain notices and complying with certain conditions, of asserting ownership to the waters of settlers running through public lands. This has arisen from the necessities of mining, but like other privileges, it has been grossly abused. The *Bulletin* correspondent at Sacramento writes that Swift has introduced a bill into the Assembly to put an end to this practice, and to prevent people from asserting ownership of the waters of streams except where they are to be used for mining purposes. The bill was considered at the meeting of the Assembly Committee on Corporations, last night, and it was resolved to recommend the passage of the same with some amendments, intended not to prevent ditches mainly used for mining purposes from being also incidentally used for irrigation.

The Richmond mining company at Eureka paid off 30 hands on the 4th. The reduction in force was caused by the difficulty in transporting ore to furnaces. The snow is falling very heavily.

H. J. BOOTH & Co. recently cast a pulley wheel for the new mint, which weighs seven tons.

Farming in the Foothills of the Sierras.

We would say a word to the grand army of farming immigrants now pouring into California from the eastern side of the continent, and it is this: That there is a vast tract of country lying along the western base of the Sierras, at least four hundred miles in length and from fifty to seventy miles in width, between the higher mountains and the great plains and valleys below, which is known as the "Foothills," and which is worthy your careful attention.

Our reasons for saying this, are these: There is a diversity of hill and valley, well wooded, and in many places splendidly timbered. The country is well adapted to grazing and dairying, while all the cereals, at least wheat, oats and barley, are a sure crop in seasons at all favorable. There are no better lands for vineyards than the lower foothills, in the whole State; while the middle and upper, with a climate partaking more of the character of an eastern winter without the intensity of its cold, is unsurpassed for the production of the staple orchard fruits, apples, pears and peaches.

Even above the highest limit to which we would expect to carry the cultivation of these fruits, we find in the greatest abundance all manner of wild fruits and berries, indigenous to the country; the wild plum or apricot, the

Thielen's Grain Cleaner.

We illustrate this week an improved grain and malt cleaner, and crusher; invented by Mr. Nicholas Thielen, of Sacramento; and patented through the Scientific Press Patent Agency. The machine is a durable one, and well adapted to its work. The grain or malt is cleaned before crushing. By employing the spreader and extra screen, hereinafter described, the grain is evenly distributed along the entire length of the rollers, so as to cause them to wear uniformly, and not in one place more than another.

The cut represents a side view of the machine. A is a three-sided box, inside of which the crushing rollers, B B, revolve; and which is mounted upon one end of a frame, C O C, in the usual manner. Instead of driving the rollers by belts, applied directly to pulleys on the extremity of each shaft, the inventor employs an additional or supplementary shaft, *d*; outside of the box, A, and parallel with the rollers, B B, a large fly-wheel, E, is secured to each end of this shaft, and inside of one of the fly-wheels, a spur-wheel, *f*, is secured, which engages with the spur-wheels, *g g*, on the extremities of the roller shafts, so that by driving the supplementary shaft, *d*, the rollers are also revolved. The shaking-screen frame, *h*, has its upper end supported at the upper end of the frame, C O C, opposite the rollers, between two upright arms, *i*, of the rock shaft, *j*; an arm, *k*, depends from the middle of the rock shaft, and

GRAIN AND MALT CLEANER AND CRUSHER.

choke cherry, huckleberry and hawberry in abundance, showing the perfect adaptability of soil and climate to their growth.

As an inducement to those who are not afraid of an occasional snow fall, and who would glory in a healthy mountain home, and a mild winter's cheerful fireside, we can say that there are millions of acres of such lands yet unclaimed, nor have the government surveys as yet been extended over them. Here are limpid streams of water, ever cold from the everlasting banks of snow above. No finer places for the artificial culture of trout, than among these foothills, where large springs and cold waters abound.

Only a few objections can be brought against a foothill home and life—the summer season is not quite as long as in the low valleys of the State. Vegetation does not start as early, nor can the more tropical fruits be grown as they are where snow never falls; but for all else than these, give us a foothill or even a mountain home, for health, happiness and a thousand comforts unknown to the torrid valleys.

HUNTINGTON'S PORTABLE SAW MILL.—We mentioned some weeks since that Frank A. Huntington's machine-shop had been removed from the old stand, 18 Fremont street, to the Globe Works, better known, perhaps, as the building formerly occupied by the machine-shop of the Vulcan Iron Works. Mr. Huntington's facilities for business have been increased at least three-fold in his new location. He makes a specialty of a patent portable saw-mill, a cut of which appears in our advertising columns this week, to be followed shortly by that of a shingle machine, also an invention of Mr. Huntington. Both mill and machine are built in the most substantial manner. The mill is capable of driving any saw up to sixty-four inches; is furnished with increased friction-feed and gig-back, both operated by the same lever. It can cut from 8,000 to 12,000 feet per day. The shingle machine has been pretty generally introduced among the mill men of this coast, and has a cutting capacity of 4,000 per hour.

has an oval slot, *l*, at its lower end. A transverse shaft, *m*, the ends of which bear in the side of the frame, passes through this slot; and a cam, *n*, in this shaft revolves in the slot, and serves to give the necessary rocking motion to the rock shaft, through which the necessary longitudinal motion is given to the rocking-screen frame. The lower end of the screen frame is supported by springs, or double-pointed hinged arms; *p* is the main screen which extends from one end of the screen frame to the other; and *q* is a short screen of coarser texture, which is secured either in a horizontal position, or at a slight inclination, opposite to the angle of the screen, *p*, at the upper end of the screen frame, just below the hopper, *r*.

A spreading plate, *s*, is secured upon this short screen, *q*, directly below the opening through which the grain or malt is fed from the hopper, so that as the grain or malt falls, it will be spread evenly on the screen. This spreading-plate is made triangular in shape, with its sides inclining to a ridge formed by bending it along a line drawn from its acute angle to the middle of its hypotenuse, so that the grain or malt will, by striking this ridge, be directed, by the inclining sides, in each direction upon the screen.

The short screen, *q*, can be adjusted so as to stand at a greater or less angle, as desired. The entire machine is driven by power applied to the supplementary shaft, *d*, belts being used to transmit the required motion to the screw-shaft and cam-shaft. An apron, *t*, at the lower end of the main screen, *p*, serves to deliver the grain or malt between the crushing rollers.

In cleaning grain without crushing it the set screws which adjust the rollers are withdrawn so that the rollers can be separated, thus permitting the grain to pass through without crushing.

Parties desiring further particulars concerning this machine can obtain them by addressing the inventor, Box 320, Sacramento, Cal.

The Mining Stock Board, New York City, dissolved Saturday, and Gilbert L. Haight was appointed receiver. The Board had a surplus fund of \$20,000.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last in their new quarters at the corner of California and Dupont street. The following new members were elected: A. S. Halliday, A. D. Smith, W. M. Wherry, resident members, and Albert A. Harris, life member.

Donations to Museum.

Mr. Henry G. Hanks presented to the museum specimens of borax from the crude to finished product. There were nine different samples in this donation, as follows: Bi-borate of soda, crude, from Nevada; li-borate of soda, refined by Pacific Chemical Co.; bi-borate of soda, native, from Borax Lake; tincal or crude borax from Slato Range, Cal.; tincal from Thibet Lakes; crypto-morphaite (borate of lime) from Oregon; nlexite (borate of lime) from Nevada; individual borax crystals, from Pacific Chemical Co; residual crystals from rats.

Mr. I. O. Woods presented specimens of *limnoria*, a species of wood-eating worm from piles in the wharves of the bay. They were taken from near high water mark when the tide was out. They lived 24 hours in the wood after being removed from the piles. A sample of wood accompanied them to show how they penetrated it.

Mr. P. S. Shout presented ten samples of ores from mines in Humboldt county, Nevada. Mr. S. G. George, of Porterville, Montana, sent to the Academy the head and horns of a Rocky mountain goat. The animal was captured near Deer Lodge, Montana, and belongs to a species which Mr. George believes to have escaped the notice of naturalists. It has a musk sack behind each horn, and closely resembles the Thibet goat, the wool of which is so rare and high priced. Several of the animals have been captured alive and one will shortly be exhibited in this city. It is designed to cross the species with the Angora goat, in expectation of producing the most valuable goat in the world.

The Ophir Mine Skull.

Dr. Blake exhibited the cast of a skull that had been taken out from the Ophir mine, on the Cometock lode, Nevada. The skull had been brought up with some dirt from the 400-foot level, but it is probable that it had been carried down in dirt from a neighboring ravine, which, at an earlier period, had been used to stop some of the former workings. But, independently of its history, the skull presents some features which render it extremely interesting, from an ethnological point of view. The principal of these were the presence of a large interparietal bone, extending almost to the occipital protuberance, the heavy superciliary ridges, the very low forehead, and great development of the posterior portion of the skull, the peculiar structure of the cavity for the articulation of the lower jaw, and the great development of the processes for the attachment of muscles. Unfortunately the whole of the palate portion below the orbits and a large part of the base of the skull were missing, but from what remained the Doctor considered that it presented a form the farthest removed from that of any existing race of human beings of any skull that had been found. The skull was sent to Dr. Blake by Professor Whitney to make an anatomical description of it. The original skull was covered with a thin metallic scale deposited by the water, and it had been broken somewhat by the pick-axe of the miner when excavated. A more detailed account of its possible history and peculiarities is promised from Professor Whitney.

Easter Island Hieroglyphics.

At a meeting of the Academy in November last, photographs of strange but beautiful hieroglyphics, cut in wood, and found on Easter Island, were received from Mr. Thomas Croft, of Papeeti, Tahiti. From vague traditions among the natives, they were supposed to represent the written language of some prehistoric nation. The stone idols found on the island exhibit a refined form of art, and other relics found there go to prove that the present population has gradually degenerated from a previous occupation. In the letter accompanying the hieroglyphics, Mr. Croft stated from the best information he could obtain, that none except the priests and a chosen few could decipher these strange characters. A letter was read from this gentleman at the last meeting, in which he stated that he had found a native of the island who could read them and who was going to teach Mr. Croft the language, so that he will shortly be able to translate them. Mr. Croft thinks that he has discovered the relics of a great Malayan empire, which extended its power over that part of the ocean at some former period of the island's history.

Dr. Blake stated in reference to a paper read by him at a former meeting on the "nickeliferous sands of Frazer river," that having ascertained from Prof. Wolcott Gibbs, that the mineral he obtained from Frazer river sands, described as a magnetic oxide of nickel, and had never before been discovered, he had given it the name of "Frazerite."

ORE SHIPMENTS.—Mining operations are progressing favorably. Ore shipments for the week ending February 4th, from Little Cottonwood, are as follows: Flagstaff, 300 tons; Emma, 80 tons; Victoria and Imperial, 25 tons; Prince of Wales, 50 tons.

San Diego Mines.

We clip the following from the San Diego *World*: In a conversation with our friend Mr. Joseph Coyne, late of the Golden Chariot mine, we have learned a number of interesting things relative to the progress of mining developments in the Julian and Banner districts. Mr. Coyne thinks the present year will be one of unusual activity, and that the yield of bullion will be far in excess of anything ever known in the San Diego county mines. Preparations are on foot to develop much new territory, and the yield of the old mines will be much increased. In reply to a question of ours, Mr. Coyne says that any competent miners can obtain employment at fair wages at Julian. The largely increased scale of work will call for a large additional force of miners.

The new Golden Chariot company propose to open up their superb mine at once on a considerably extended scale. They are sinking on a new main shaft, which they propose to sink to a depth of 235 feet—one hundred feet deeper than the present shaft. Their ledge is now thirteen feet wide, and our people know the extreme richness of this rock. Their five-stamp mill will be converted into a ten-stamp one, with five concentrators. The engine and boiler for this purpose are already on the way to the mountains, drawn by ten-oxen teams, and will arrive towards the end of the week. Their old engine will be hauled over to the mine, and used in their hoisting works. They will be perfectly prepared to go to crushing rock in six weeks, if the roads keep good. The Golden Chariot company at present employ twenty-six men at the mine, and eight around the mill. They will add largely to this force under the new regime. The Superintendent of the company, Mr. Jewell, is pushing matters with great energy; and the yield from the Golden Chariot, when they get fairly under way, will astonish the most sanguine believers in this fine mine.

Thirty tons of machinery altogether have been dispatched to the Golden Chariot mine. The machinery for the new ten-stamp mill of the company is adapted to run a twenty-five-stamp mill, if the developments warrant it. The stock of the company is already selling for \$7 per share on the San Francisco stock board. As there are 30,000 shares this would give a present value of \$210,000. This is not a bad exhibit, considering that the mine was purchased by the company for \$95,000. The large yield certain to be reported this year will send this stock up largely.

The Helvetia, lately incorporated, will shortly be prepared to go to work on quite a large scale. They are waiting for the arrival of their mill and hoisting apparatus, which are already on the way from San Francisco. They have already on their dump three hundred tons of good rock, which will pay handsomely when their new machinery arrives, but which it would hardly pay them to haul to a quartz mill owned by other parties. The promise for this mine is very good.

The Owens mine is preparing to start again shortly. They have a splendid ledge in their air shaft and are ready to go to work on their main shaft. Col. Desires has telegraphed from San Francisco to pay all the debts of the company. They have all the money they need for that purpose, and a surplus, besides, to push on the work. This mine will give a good account of itself this year, and its stock will appreciate sensibly in consequence.

The Ready Relief is looking well, and when the Baily Brothers get through their ranching they will resume the development of their mine with new ardor.

New discoveries are being made. The Messrs. Osterhouse & Dilks have struck a fine three-foot ledge, on which their shaft is down fifty feet. Their rock runs from \$14 to \$32 to the ton. In sinking their shaft they have already taken out and had crushed about \$900 worth of rock.

A very important discovery has been made in Rattlesnake cañon. The new claim is about five miles from the Golden Chariot mine, is in the same range, and it is regarded as an extension of that mine. The shaft has been sunk for some distance on the ledge, which is eight feet wide. This promises to prove a very valuable mine. The rock is abundant, and runs from \$15 to \$25 to the ton. It was discovered and it being worked by a brother of Coroner Young, of this city.

The Stonewall is yielding splendidly, and has all the water required.

The Messrs. Frary & Wilson are about starting a grist mill in Julian. The crops in every direction promise to be abundant, and our enterprising friends have determined upon giving the miners a mountain brand of flour.

All the indications point to a large increase in the population of Julian and Banner, and to a trebled yield of gold this year over last.

BARRELS OF GLASS FOR PETROLEUM.—So much loss has occurred from evaporation and leakage in the transportation and storage of petroleum, and its products—benzine and gasoline—that it is proposed to make barrels of glass, sufficiently heavy to stand the pressure and usage. These, although much more costly at first, would never wear out, and could be cleaned and used for other fluids indefinitely. An inventor has already obtained a patent for a thick piece of glass inserted into one head of a barrel, on the part next the bung-hole, to allow the quantity within to be viewed by the buyer.

Does Utah want a Mint?

A mint for coinage requires fine bullion, and they do not return the base metals; that being the case, nearly all of our bullion must go through a refinery, in order to get it into the mint, adding to the expense of the producer, freight and separation; and now being ready to pass the mint, it comes out in coin, and what are we to do with it? Now we cannot pack it to the mountains to pay labor, it is too bulky, but we must go to the bank, and sell it at perhaps one per cent. off for currency; and how long would it be before our banks would be full of silver coin, and that traffic be stopped? If we attempt to ship it East or West, we must pay three per cent. and the per cent. on currency. Back of all these expenses, the miner must stand, and then it would be impossible to get one-half the amount of bullion produced in the Territory through the mint.

Our experience has taught us we cannot afford to lose our lead in bullion; we must get pay for all the metal we extract.

Suppose we turn our mint into a Government Assay Office, and all the bullion that comes from the different mines, whether high or low grade, from furnace or mill pass through this assay office and is assayed, the value of each bar in gold, silver or lead stamped on them with the government stamp; that fixes a value to it and we get a certificate expressing its value; then the banks can make advances on it; that enables us to go on getting out more bullion and this bullion can be shipped by the ton East or West at much less rates, where it can be separated at a much less expense than here, and can take the advantage of the market for manufacturing purposes, or have it coined as they choose; the value being stamped on it, every man knows what he is buying, and no chance for our Eastern friends coming back on us for "salting."

Utah will, in a few years, astonish the world with her bullion, and the amount that can be purchased, and it stands in hand to get the right channel for it to pass through, that the miner may be rewarded for his toil, and to increase the amount purchased as fast as possible, and it is better for us to give our whole attention to purchasing that bullion and let outsiders attend to the refining and the lighter part of the work.

In order to get this question before Congress, in the first place, will our Territorial Legislature donate a tract of land near the railroad for a Government Assay Office, and then ask Congress to make an appropriation? In the meantime, let our citizens get up petitions to Congress for the appropriation, setting forth the necessity, and I think the end will be accomplished, for it is essential that the Government have the mineral resources of the Territory developed as fast as possible, and when the fact shall have been abundantly established that we have an inexhaustible supply of the precious metals in Utah, they will see to it that a mint is forthcoming.—*Cor. Salt Lake Tribune.*

Suggestion to Prospectors.

Throughout a vast area of territory, from the British Possessions on the north to the Rio Grande on the south, and from Kansas on the east to the Pacific Ocean on the west, there are thousands of hardy men constantly engaged in prospecting for precious minerals. Usually these prospectors are, as a class, border adventurers—men accustomed to the privations incident to a life in the savage wilderness, and but little acquainted with the practical sciences, and hence, if they find a mineral deposit of any value, it is more the result of accident than anything else. Now, this hardy, dare-devil body of prospectors can be rendered the most efficient auxiliaries of mineralogical and geological investigation and become the developers of vast deposits of precious treasure. To practically utilize this widely disseminated prospecting force, it is simply necessary to establish at San Francisco, Portland (Oregon), Virginia City (Nevada), or at some available point on the Pacific coast, a prospectors' association, or an organization for the mutual benefit of all such men as we have just mentioned. If such an association could be formed, the constitution of the concern should provide that every prospector should be entitled to an unassessable portion of all valuable mineral deposits which he should discover and bring to the knowledge and possession of the association, and that each prospector should be entitled to a pro rata interest in the entire property of the concern.

Of course this is merely a crude, undigested suggestion of what might be done to render the labors of adventurous men valuable to science and an aid to the general advancement of the country. It is not necessary that every man who starts out prospecting should be a scientific expert. All that is requisite for him to do is simply to save samples of any curious fossils, minerals, gems and odd-looking rocks, and bring them for investigation by members of the association. There are thousands of men now engaged in treasure hunting who cannot tell a diamond from a quartz crystal, nor a sapphire from a garnet, but with the arrangement which we have proposed, the veriest ignoramus can be enabled to enrich himself and add to the coffers of his hardy comrades by simply saving what he finds and having it examined by experts of his own selection.—*Virginia Chronicle.*

Tin Mining in Banca.

In September, 1872, Mr. W. Bredemeyer, who had recently returned from Banca, wrote an article for this MINING AND SCIENTIFIC PRESS, which was afterwards copied in the London *Mining Journal* and other papers. A recent issue of the London *Mining Journal* contains a letter from a correspondent, referring to Mr. Bredemeyer's article as follows:

The thanks of all interested in tin mining or tin streaming are due to your correspondent, Mr. W. Bredemeyer, for his rare and valuable letter naming the localities where the binoxide of tin occurs, and especially for describing riches so long known and advantageously wrought under the best government of the East Indies, the Dutch government. I wish to correct a few inaccuracies, which I presume were made in translation—namely, that "Tin-bearing strata are found three to twenty-two inches deep." It should have been, "The tin-bearing strata are found three to twenty-two inches thick, within nine to thirty feet deep." The alluvial tin deposits immediately on a kaolin, or porcelain earth *in situ*, are richest; hence it is an accepted principle that there is no possible chance of finding alluvium tin below. My remarks on the second paragraph are that paths ten feet wide are cleared up the valley; other paths are made at right angles; when these are surveyed, a staff of natives, under European engineers, commence to bore with a three-inch auger, worked in a copper tube. The earth extracted by the auger is collected and washed for tin. If these three-inch holes contain sufficient quantities of binoxide of tin to pay for opening a tin-stream work, notes are made, and the locality is red-lettered on the survey, representing new fields for mines.

The waters of the rivers from lateral valleys are conveyed by open channels, and thus prevented from inundating new works. The debris or overburden from an advanced opening or mine is conveyed in baskets containing five to ten pounds, suspended to a stick carried across the shoulder of the laborer to the last abandoned mine, or unto lands from which the tin strata have been collected. The tin ore is not disseminated through the depth of the overburden, but generally in a layer, as described above; hence there is but little trouble in removing the first eight or ten feet of earth. The water in the mine is drawn up an incline by a Chinese endless timber pump, having a pin hole in each end of a seven-inch length or link, the consequent wear and breakages, entailing endless trouble and expense.

The coarse sand, clay and tin ores forming the tin strata, selected from the sinking, are washed in a launder twenty inches wide and forty feet long, laid at an angle of five degrees in the ground. The specific gravity of the tin keeps it at the head, and the force of water carries away the debris, so that all the small grains of tin are lost. The clean tin ores from a few mines are associated with iron pyrites, giving additional trouble, and producing an inferior metal. The contracts between the Government and Chinese coolies will be the subject in a future letter. In conclusion, I have only one other remark, namely, that the clear profit to the Government is given at \$5,000,000, while, in reality, this sum is sufficiently large to purchase, in open market, more metallic tin than the yearly supply of the islands of Banca and Billiton.

WESTERN AUSTRALIAN MINE.—The Government of Western Australia, who are naturally desirous of having a gold-field in their colony, have recently been advertising in Victoria, the terms on which they are willing to employ Victorian miners to prospect their colony for a payable gold-field. The terms offered were—a free passage to Western Australia, a maintenance allowance of 25s. per week while prospecting, a reward of £5,000 for the discovery of a payable gold-field, and a very large prospectors' claim on the field discovered. The total number of the prospecting party was to be fifteen, to be divided into three separate parties of five each, one of which was to land at Albany, King George's Sound, and prospect the country there, especially that in the vicinity of the Philips River, about 100 miles north-east of Albany, where there are favorable indications of auriferous country. The two other parties were to proceed to Fremantle, the Government proposing that one of them should go to Champion Bay and make that its base of operations; but it was possible that intention might be altered, and both of the remaining parties be employed in the country near Perth.

A TINY ENGINE.—The smallest engine in the world is now in possession of John Penn, of Greenwich, England, the eminent maker of great engines. It will stand on a three-penny piece; it really covers less space, for its base plate measures only three-eighths of an inch by three-tenths. So small are some of the parts that they require a powerful magnifying glass to see their form. The whole weight of the model is less than a three-penny piece. It works admirably, and when working, its crankshaft performs from twenty to thirty thousand revolutions in a minute.

One is now being shipped from the Gould & Curry mine to the Occidental mill on sleds, the roads not being in a condition to admit of its being transported on wheeled vehicles. This is the first time in the history of the Comstock that ore has been shipped to any mill on sleds.

Klamath County Mines.

A correspondent of the *Call*, writing from Sawyer's bar, Klamath county, says: Sawyer's bar is reached from Scott's valley over a trail which is closed by snow four months in this year. The great want of a wagon road is severely felt by every resident of this rich mining district. The Salmon river, which has yielded immense riches, flows through the town, and is still worked to advantage by a large number of miners. The quartz interest is but in its infancy, and promises to be more extensive and richer than in any other mining district in the State. First comes the Black Bear company, which has been disposed of by its original owners to a San Francisco company for \$300,000. Had they but known the immense riches left in the ledge, they would have hesitated before selling. The present company is sparing no expense to develop the mine for the purpose of erecting more extensive machinery. Their present force on the pay roll numbers over ninety men, who receive from \$50 to \$60 per month. The width of the ledge varies from 5 to 45 feet, and the ore yields an average of \$25 per ton. New machinery is being erected underground, for the purpose of opening up the entire and extending the lower level to the Yellow Jacket, which yielded \$40 to the ton. The ledge extends and is owned by the company 5,200 feet, and runs north and south. Next season it is expected that a new mill, with more extensive machinery, will be erected at the mine. The present mill is located over two miles from the mine, and entails considerable expense in the transfer of quartz to the mill. Its force is sixty-horse power, driving twenty-eight stamps. There is also a "settler" and "concentrator," as well as chlorine works for obtaining gold from the sulphurets. The company also boast of a foundry, where all the necessary iron work is manufactured.

Two miles distant, and which I believe is the extension of the same ledge, is the Klamath Gold Quartz Company, with H. A. Bigby as Superintendent (W. A. Farish being Superintendent of the Black Bear). The prospects of the Klamath are equal to those of its rich neighbor. The mill is an exceedingly fine one containing thirty-two stamps. The number of hands will be largely increased when spring opens. The Evening Star is also a continuation of the same ledge, and is owned by Messrs. Rainey, Tonkin & Co., who are now engaged in crushing good stone.

On the north side of the township, and about two miles in a direct line, the Morning Star is located at the head of Jackass gulch, which has been wonderfully rich in large gold. The ledge is owned by Messrs. Barknell, Rellner & Doran, who have, by their own perseverance and enterprise succeeded in discovering a rich quartz mine, well defined and containing a great deal of free gold of both fine and coarse quality. It is no doubt the source from whence the gulch obtained its immense richness. While I am writing, a rumor is in circulation that the "Morning Star" has struck something big, but nothing definite can be known till they clean up, which will be in a few days. There is no doubt but that this town will in a short time become the center of a rich quartz district, and nothing but the great difficulty of obtaining supplies and of getting over the mountain has prevented it from being one of the most important gold quartz mining districts in the State.

The Stickeen Mines.

A correspondent of the *British Colonist* (Victoria, B. C.) writes as follows concerning the Stickeen river mines: "I have just returned from the Dense lake mines, and thought you might feel interested enough to like a small description of them.

First, Buck's bar on the Stickeen river is about the head of canoe navigation. There you leave the river to your right and follow the left hand bank till across the first and second north forks and come to the third. Then you follow it till you come to a low divide to the north, where you cross over to the lake. The whole distance is about 80 or 85 miles from Buck's bar to Dease lake; and from the mouth of Stickeen river to Buck's bar is about the same distance as from the Skena to the forks; but the Stickeen is a better river to canoe on. Down the lake to Dease creek is about 25 miles, and down 12 miles further is Thibert creek.

No doubt you will hear all about what the miners have made, and what prospects they got. As for myself, I think I have got about as good a claim as any. I got \$4.75 in the four first pans I tried there. I rocked one day and took out nine ounces and fourteen dollars on the bed-rock. The gravel pays well, too. The diggings are from one to five feet. Deep creek is about the same size as German creek, and Thibert creek about the same size. I like the looks of the country well, and they are the easiest mines to get into that have been found in British Columbia mines yet. Everything looks favorable for a large mining camp. I am going to start up in February from Fort Wrangel. I have got all my grub on Buck's bar, and I intend to sleigh it in from there on the ice."

New Gravel Mill.

We are informed that the ten-stamp gravel mill lately constructed by D. C. Wicham, for Goldner, Siron & Augard, was put in operation on Monday of last week—on trial—preparatory to acceptance by the latter named gentlemen. The mill worked like a charm, and we are told that mill-men who have examined it, declare it to be the most complete mill of the kind ever built in this county. The iron work was made in this city, by H. S. Morey, of the Placerville iron foundry. The stamps are four hundred and fifty pounds each; each stamp has an eight inch drop, and makes eighty-six drops per minute, with full head. The mill is operated by water power, a pressure of two hundred and fifty having been attained; the water is driven through an inch nozzle against an iron hurdy-gurdy wheel which makes a hundred and twenty revolutions per minute. The capacity of the mill is forty tons per twenty-four hours, of the kind of gravel—or cement—extracted from the claim. The owners have some eight hundred tons of gravel on the dump, which has been mined out since the mill was constructed for. With but little interruption, the mill has made full time since it started. Good ore anticipated by the owners of this mine and mill, located about five miles east of this city. May they not be disappointed.

We understand that Mr. Wicham has a contract for building another gravel mill, at Smith's Flat, for a San Francisco Co. Come along, gentlemen, there are yet millions of tons of gravel in this vicinity that will pay for working. A little nerve and capital is all that is required to make gravel mining a success here.—*El Dorado Republican.*

Rye Patch Items.

This place has a fine ten stamp mill, capable of reducing fifteen tons of ore per day, connected with which is a Stetefeldt roasting furnace. These works are in charge of Superintendent Crittenden, to whose management is due the present prosperity of the Rye Patch Mill and Mining Company. The mill and furnace are running to their full capacity, besides which this company ship about ten tons of ore a day to Winnemucca for reduction, the company's mill at Rye Patch not being of sufficient capacity to work all the ore taken from the mine.

The mines are located about four miles from Rye Patch Station, in and near Battle cañon. The first of note is the Battle, owned by the Rye Patch Mill and Mining Company. This mine, which takes rank with the first-class mines of the State, gives employment to forty-five men, produces about forty tons of ore daily, and is steadily increasing in value.

The next one of importance is the Alpha mine, which has produced a vast amount of rich ore. Work on this mine has been suspended for some time, owing to company difficulties, but the company intend putting on a force of men in a few days, when the Alpha will again take its place as one of the brilliant producing mines of this State.

Charles Harley, of San Francisco, has men at work on his claims, with flattering prospects. There are several other companies at work in the district on old locations, which look well.—*Silver State.*

THE WHITE PINE TUNNEL.—We yesterday had a call from Mr. Walton, one of the old residents of Hamilton, and one of the principal land owners in that town. His object in visiting Enreka is to solicit the signatures of our citizens to a petition he has in circulation throughout Eastern Nevada, for the development of White Pine mountain. It is proposed to petition Congress for a grant or franchise of the mountain, for the purpose of a running a tunnel through it of railroad size, which will be about eight or nine miles in length. The originators of this work do not intend to ask a subsidy or loan from the Government, merely the franchise of the land; so as to prevent any interference with the title of the land after the commencement of the work. It is proposed to form a joint stock company, with sufficient capital to carry out the intended designs. Mr. Walton has secured over 2,000 names to his petition, and will start in a day or so for Washington to lay his plans before the representatives, and through them bring the matter before the proper committee.—*Sentinel.*

HYDRAULIC MINING IN MONTANA.—The *New Northwest* says: The Flint Creek Ditch and Mining Company this week received their large invoice of iron pipe, etc., for their mines on Flint creek. It consists of 300 feet of 22-inch No. 18 iron, and 1,000 feet of 15-inch No. 16 iron, with a No. 2 Little Giant, Reflector Lamp, and tools necessary for putting it in complete working order. The material costs laid down here about \$4,000. Clarke, Steele & Co. also received 1,200 ft. of 11, 15 and 18-inch pipe, Little Giant, etc., a few days ago, and will place it for operations in Squaw Gulch next spring. The appliances purchased by those two companies are the same as those used by the best miners of California, and the gentlemen, while looking to their own interests in procuring the most approved appliances for hydraulic mining will have done, if successful, a good thing for all hydraulic miners, and we believe demonstrate the richest diggings of Montana are the extensive bar deposits that have heretofore been passed by as unavailable.

COUNTIES OF CALIFORNIA.—There are over fifty-one counties in California. They range in size from 42 (San Francisco) to 23,472 (San Bernardino) square miles; and in population, by the census of 1870, from 430 to 150,000, Mono being the least and San Francisco the most populous. The average area is 3,725 square miles, which is nearly twice the size of Delaware. Their average population is about 11,000. San Bernardino is larger than West Virginia.

ZINC MINES.—Zinc ore in considerable quantities was recently discovered in Laae county, near what is known as Cow creek. A small quantity of the ore was dug out and forwarded to this city. Mr. Fisk made an assay of the metal, and found it to contain a large per cent. of zinc.—*Oregonian.*

AUGUSTA TURNS OUT yearly over one hundred thousand dollars' worth of tools for cutting granite. They are used all over the country.

The estimated capacity of all the blast furnaces in the United States is 4,371,217 tons per annum.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counselors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

POPULAR LECTURES.

Mechanics' Institute Lectures.

The Great Lava Overflow of the Pacific Coast—by
Prof. Joseph LeConte—No. 3.

[Reported Especially for the Press.]

Prof. Joseph LeConte delivered the third of the series of lectures now being given before the Mechanics' Institute, on Saturday night last, before a large audience. The subject was an exemplification of his Theory of the Formation of Mountains, as illustrated by the great lava overflow of Northern California and Oregon.

The Great Lava Bed

Of the region named, the lecturer stated, commences near the middle of California, where it appears in separate streams; but passing northward it unites, increases in bulk, covers almost the entire surface of Oregon and Washington Territory, and extends far into British Columbia on the north and Idaho and Montana on the east. This immense flood of lava covers a region of country some 700 miles in length by from 300 to 400 miles in breadth, and varying from a few hundred to some 4,000 feet in thickness. The thickness where it is cut through by the Columbia river is 3,700 feet. The Des-Chutes river, running at right angles with the Columbia, runs for 140 miles through a narrow cañon or gorge, on both sides of which lava is piled up to the height of from 1,000 to 1,500 feet, and still the river has not cut its channel more than half way to the bottom of the deposit. Mr. King has traced this lava for at least 300 miles along the Snake river.

The Sources of this Great Outflow

Are to be found in the immense fissures in the Coast and Cascade mountains, the lava so running together as to make one universal mass. It occurs in layers, one above another, so distinctly separated that there can be no mistake about the fact of there having been several distinct overflows. The lecturer

Illustrated His Remarks

With plans on the blackboard, which we here reproduce, as previously introduced in connection with his paper on the same subject, published in the proceedings of the Academy of Sciences; which institution has kindly furnished us the engravings for this purpose. The lecture thus illustrated furnishes a series of most interesting and remarkable facts and discoveries.

One of the illustrations given was similar to Fig. 1, showing the different ledges of lava, as they appear at the Cascades of the Columbia river. In this figure (a) represents a coarse conglomerate, extending from the water level, 15 feet upwards, to (b), which is a veritable ancient ground-surface as it was before those ancient convulsions of nature, by which it was buried to a depth of some 3,000 feet or more. On this ancient lava are now seen silicified stumps, with roots running down into the soil beneath. Immediately above this ground-surface is seen, first, a layer of sandstone (c), two feet thick, filled with leaf-impressions. Above this, again, lies a conglomerate (d), irregularly stratified in spots, containing fragments of silicified drift-wood. Upon this uneven surface (e) rest the lava layers, one above another, as shown, to the height of nearly 3,000 feet.

Figure 2 is an ideal section, representing a section of the cliff, as seen at this place; but there is no uncertainty about the actual relation of the lava to the conglomerate, etc., as shown. In Fig. 2, b most unmistakably marks an old forest ground, where the stumps still remain in the very spot where they grew. The trees were destroyed by water, which first overflowed the country, and which gradually covered the earth to a depth of several hundred feet with a coarse deposit, upon which the lava was subsequently poured from the fissures as mentioned. The outflow of lava probably continued at intervals throughout all the later years of the Tertiary period, from fissures; as the fissures gradually closed, or were filled up, the flow has been continued in spots, by crater eruption, until very nearly the present time.

The Geological Age of the Outflow

Is readily determined by the leaf impressions and silicified wood which have been found in the water-drift underlying the lava. The earliest of this lava flow undoubtedly occurred near the end of the Miocene period, and coincident in time with the formation of the Coast range of mountains. The underlying portion, upon which these vegetable remains grew, was no doubt originally a low ridge, composed of granite and slate, like the Sierras, and probably of the same age.

Figure 3 is a diagrammatic section along the Columbia river cañon, at the Cascades. The wide part enclosed between the cliffs, a, a, is about five miles across, and was doubtless once entirely covered by the waters of the river. The erosion has occurred during the post-Tertiary, either by ice or water, or more probably both. During the present epoch, the greatly shrunken river has cut its way into the underlying conglomerate, moving gradually southward, until it has formed on the southern side quite a high, perpendicular bluff, as shown.

Prairie Mounds—The Devil's Potato Patch—Formed an interesting division of this most interesting lecture. They occur near the

southern extremity of Puget sound, in a series of glades or openings. They are narrow, ramifying glades or grassy prairies, entirely destitute of trees or shrubs, but in the midst of dense fir forests. These mounds are about three or four feet high and thirty or forty feet in diameter, regular in size and shape. There are millions of them. They are made up mostly of small pebbles and coarse gravel, and are covered with ferns and small grass.

Much speculation has been indulged in as to their origin. Some suppose them to have been ancient Indian burial grounds, or raised foundations for huts, on a wet soil; others think they were formed by fish while the ground was still submerged under a shallow sea. Close examinations, however, have led scientists to attribute their origin to erosions under peculiar circumstances. From the Dalles to the DesChutes river, a distance of some 30 miles, the country is also covered with these mounds. On the mountain verge of the valleys of California, where the original soil has not been disturbed by the plow, the same phenomena may also be frequently observed. In this State, especially in the San Joaquin valley, such localities are called "hog wallows," and in Oregon, the locality in which

Fig. 1.

they are most conspicuous is properly known as "The Devil's Potato Patch."

This interesting and instructive lecture was listened to throughout with marked attention.

Prof. Neri's Lecture—Magnetism and Electricity—No. 2.

[Especially Reported for the Press.]

The first lecture of the course was devoted to the consideration of frictional and static electricity. The present lecture will be devoted more especially to magnetism, and its relation to electricity. A certain class of electrical phenomena is attributed to magnetic force. About six hundred years before the Christian era, it was discovered that a certain kind of rock was known to possess the property of strongly attracting iron. This rock was called magnet, from Magnesia, the country in which it was discovered. In the modern study and classification of minerals, this rock, which is a natural magnet, is found to consist largely of a peculiar oxide of iron—a mineral from which the best quality of iron is made—and which occurs in many places, particularly in Sweden. A specimen of this rock, highly polished, was exhibited, and its attracting properties demonstrated. Very little was known about magnetism by the ancients, and it is only within about two hundred years that it has been much studied.

The Natural Magnet

Possesses the property of transmitting its power to steel, which thereupon is found to possess a greater power than the original magnet. Various forms of artificial magnets were shown—the single bar, compound bar, and the horn-shoe form of both. It has been found that the power of a magnet is greatly increased by hanging a weight upon it, and gradually increasing that weight at intervals.

Polarity of the Magnet.

Magnetism, like electricity, possesses two qualities, positive and negative. Each magnet has its positive and negative pole, designated in the magnetic needle as the north and south poles; also, a neutral point midway between the two, where no influence is discernible. That a marked difference exists between these two is shown by various demonstrations. Opposite polarities attract; equal polarities repel. What this mysterious influence is, or how it is caused, has thus far eluded the closest and most scientific scrutiny. If we divide a magnet at any point, each portion of the original becomes itself a magnet. This division may be carried on indefinitely. If we could divide so minutely, we should no doubt find that each molecule of the original was a magnet, possessing positive and negative poles, and its neutral center. Hence, magnetism is not inherent, or does not reside at any particular point of the magnet.

Magnetic Lines of Force or, Curves.

The lines of magnetic force pass in graceful curves from one pole to the other of the magnet, and vice versa. This fact was demonstrated

Fig. 3.

by showing the influence of the magnet upon filings. This experiment, which, from its nature, is usually confined to the observation of a few who may gather around a table, was distinctly shown to every individual of the large audience of nearly 1,000 persons, by being projected upon a screen by means of a newly devised instrument made up of reflectors and prisms.

Magnetic Induction.

In addition to the property which the magnet possesses of transferring its influence to steel by being rubbed upon it, it also possesses the remarkable peculiarity of transmitting its power by induction. A piece of common iron when placed in contact with a magnet, and even when not in actual contact, but near to such a piece of iron, also becomes magnetic, and continues so as long as it is kept under the influence of the original. This is called induction, and is similar to the same principle developed in electricity.

The earth itself is a huge magnet, and its north pole attracts the south pole of the needle; hence what we call the north pole of the needle is really its south pole. We reverse the nomenclature simply for convenience, because the south pole is always upon the north point

Fig. 2.

of the needle when it is freely suspended.

Magnetic Vibration and Dip.

It was for a long time supposed that the needle always pointed due north and south; but it has of late years been demonstrated that there is always a variation either east or west and greater or less at different points on the earth's surface. This irregularity of the needle is called "magnetic variation." Its cause is not yet fully understood, and its existence is not constant, or alike at all times in any one place.

The needle has also another variation called its "dip." On the equator there is no dip; the needle stands there perfectly horizontal. As we go north or south, the variation from the horizontal is gradually changed, until, if we could reach either of the earth's poles, we should find the needle there, if freely hung, occupying a perpendicular position. This peculiarity was first discovered in 1576.

It is claimed that the magnetic needle was known in China 3,000 years ago; but the claim is

considered doubtful. But the first idea of it undoubtedly came from the east, and was probably introduced into Europe by Marco Polo.

The Effect of the Magnet on Gold, Silver, Copper, etc.

The magnet, besides its influence on steel and iron, has also a greater or less effect upon most other substances, such as gold, silver, copper, nickel, cobalt, zinc, glass, paper, cloth, liquids and gases. This influence on a limited number of substances has long been known; but Faraday made the matter a special study, and demonstrated the fact that it had a very wide and almost unlimited influence, though in relation to most substances its influence was extremely weak. He devised an apparatus which was capable of detecting its influence when exerted only one-millionth part as strongly as upon iron. This instrument was exhibited and its action explained. The power of this instrument to develop the more minute influence of magnetism depended upon a peculiar and intimate

Relation between Magnetism and Electricity.

When electricity is caused to pass through two magnets whose poles are placed in close proximity to each other, the magnetic power is most wonderfully intensified at the interval between the two poles, and the instrument then becomes what is known as an electro-magnet. Pieces of gold, silver, copper, etc., placed in the interval between the poles, which is called the magnetic field, and which were not at all visibly affected by the ordinary magnetic current, were most palpably influenced when the electric current was added to intensify the former. The increased power of the electro-magnet over the simple magnet was also otherwise demonstrated in a most remarkable and amusing manner, as in the greedy way with which it would seize upon and hold a large mass of carpet tacks or small nails. The influence of a rotating disk or plate on the magnetic needle was also shown.

The Magnetic Force Universal.

The magnetic force has a most important

purpose in the grand economy of nature, and extends its influence throughout the entire universe. This is inferred from the known influence known to extend from the sun to the earth. What are called

Magnetic Storms

Or an unusually excited condition of the magneto-electric forces upon the earth, are known to have their origin (at least sometimes) in the sun. Unusual disturbances in the sun, such as the extraordinary eruptions, which modern observers have been able to detect and so fully describe, are always accompanied by magnetic storms on the earth. It has also been ascertained that sun spots have an important influence in this direction.

A Remarkable Instance

Was referred to, where an observer in Europe having noticed a certain disturbance in the sun's atmosphere, immediately telegraphed to all the magnetic observatories on the earth, with which he could be put in communication, when it was discovered that a general magnetic disturbance or storm commenced in the vicinity of all those observatories, simultaneously with the same phenomena in the sun. The learned lecturer concluded by announcing that these higher and most important phenomena connected with magnetism and electricity would form the subject of his future lectures, the next one of which would be given on Thursday evening, February 12th.

PAIN-KILLER!

FOR OVER THIRTY YEARS

Perry Davis' Vegetable

PAIN KILLER

HAS BEEN TESTED IN EVERY VARIETY OF CLIMATE, AND BY ALMOST EVERY NATION KNOWN TO AMERICANS.

It is the constant companion and estimable friend of the missionary and the traveler, on sea and land, and no one should travel on our Lakes or Rivers without it.

It has been before the public over thirty years, and probably has a better and wider reputation than any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the Pain-Killer; but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful whether used internally or externally, and it stands to-day unrivaled by all the great catalogue of family medicines. It is sufficient evidence of its virtues as a standard medicine to know that it is now used in all parts of the world and that its sale is constantly increasing. No curative agent has had such wide spread sale or given such universal satisfaction. It is a purely vegetable compound, and perfectly safe in unskillful hands.

After thirty years trial, is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Physicians of the first respectability, recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Rheumatism, Gout, Burns, &c., but for Dysentery or Cholera or any sort of Bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Catarrhs, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

Beware of all Imitations.

The Pain-Killer is sold by all respectable druggists throughout the United States and foreign countries. Prices—25 cents, 50 cents and \$1 per bottle.

PERRY, DAVIS & SON, Proprietors,
J224 No. 136 High street, Providence, R. I.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.

WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS.
Also, MINING PARTNERSHIP LAW.
A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

IN SPITE OF FLANNELS, Coughs and colds will make a lodgment in the system. But they are not tenants at will. You can dispossess them with *Hale's Honey of Horshond and Tar*, in less time than it takes a shoemaker to execute a writ. Crittenton's, No. 7 6th Avenue. Sold by all Druggists.

Pike's Toothache Drops cure in 1 minute.

THE MINING AND SCIENTIFIC PRESS, of San Francisco, now in its 26th volume, is the best paper for the miner, the prospector and the machinist, of which we have any knowledge. Four dollars (gold) sent to Dewey & Co., will fetch it for one year.—Arizona Miner.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, re-st-claim company.

PHOTOGRAPH PAINTING done in the most satisfactory manner at 426 Kearny street, from the smallest card to full life size, on very moderate terms, by EMILY R. EASTMAN, Artist, 426 Kearny, San Francisco. bp-2t

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine, San Francisco.

PATENTS & INVENTIONS

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Feb. 3, 1874.

For WEEK ENDING Jan. 20, 1874.

MEDICAL COMPOUND.—Evelino Hungerford, S. F., Cal.

IRRIGATION PIPE.—Nehemiah Clark, Sacramento, Cal.

VACUUM RELIEF VALVE FOR STEAM CYLINDERS.—Andrew J. Stevens, Sacramento, Cal.

STEAM BOILER.—Harvey W. Rice, Haywards, Cal.

CUTTING APPARATUS FOR HARVESTERS.—Philoander Kitts, Monticello, Cal.

FEEDING DEVICE FOR THRESHING MACHINES.—James T. Watkins and Jasper S. Scott, Santa Clara, Cal.

BUNG BUSH INSERTER.—Hirrich A. Engels, S. F., Cal.

MACHINE FOR FACING CORDLE STONES.—Wm. M. Hughes, assignor to L. Duterte, A. E. Ballard and E. D. Sawyer, S. F., Cal.

GLOVE.—Isaac N. Pearson, Napa, Cal.

REINFORCERS.

BEARING FOR SHAFTS.—Jerome Haas, Stockton, Cal.

PLOW.—Don Carlos Matteson and Truman P. Williamson, Stockton, Cal.

SAN FRANCISCO METAL MARKET.

WEDNESDAY, Feb. 6, 1874.

Quicksilver is strong at the present rate, with no prospect of change. The suggestion of an exchange that loading gold and silver mining companies, the chief consumers, combine to produce the metal, in opposition to the late combination of present quicksilver producers, seems rather more feasible as the price steadily mounts up. But whatever is said of combinatorial and monopoly, the fact remains that the production of Quicksilver has largely fallen off of late, while the consumption has as rapidly, and in this light, any compulsory, unconstitutional bill to regulate the price and fix a maximum is worse than useless. At all events the rights of Quicksilver miners deserve as much attention as those of the gold and silver miners. What is wanted, is not special legislation, but more capital to open and develop the many lodes of cincharr already found, and this course is now more inviting from the very fact of the high price at present commanded: so that the laws of trade alone will in time adjust the difficulty. The general metal market is very quiet.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 32-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES,

should see to it that their Notices are advertised legally in the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Buena Vista Petroleum Company.—Location

of principal place of business, San Francisco, California. Location of works, Kern County, California. Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1874, an assessment of one dollar per share, was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 430 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 15th day of March, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By Order of the Board of Directors, L. A. GILLO, Secretary.

Office No. 430 Jackson street, San Francisco, Cal. 47

Commercial Coal Mining Company, of

San Francisco. Principal place of business, City and County of San Francisco, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 15th day of December, A. D., 1873, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A. E. Crocker.....	130 and 138	50	\$25.00
A. E. Crocker.....	130 and 141	85	17 50
H. Forrester.....	179 to 188	75	37 50
H. Forrester.....	192 to 206	255	127 50
S. B. Hanson.....	1	100	50 00
S. B. Hanson.....	128	50	25 00
W. E. Peck.....	175 and 176	200	100 00
H. F. Sheppard.....	155 and 156	175	87 50

And in accordance with law, and an order of the Board of Directors made on the 16th day of December, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 402 Montgomery street, Room No. 23, city and county of San Francisco, California, on the 23rd day of February, 1874, at the hour of 12 o'clock, m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

S. B. HANSON, Sec'y. (By F. N. W.) Office, 402 Montgomery street, Room No. 23, San Francisco.

Diamond Silver Mining Co.—Notice.

A meeting of the stockholders of the Diamond Silver Mining Company, of Tintic District, Juab County, Utah Territory, will be held on Wednesday, the 18th day of February, 1874, at one o'clock p. m., at Sherman's Building, No. 606 Montgomery street, Room 12, for the election of Trustees for the ensuing year. The subject of levying an assessment upon the capital stock of the company will also be determined.

By direction of the Board of Trustees, WM. SHERMAN, President. O. C. MILLER, Secretary. San Francisco, Cal., January 12, 1874. js-6t

Cupel and Tiger Silver Mining Company.

Principal place of business, San Francisco, Cal. Location of works, Wallapai Mining District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of October, 1873, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Directors, made on the twenty-fifth day of October, A. D., 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, room No. 12, Express Building, San Francisco, California, on Saturday, the twelfth day of December, A. D., 1873, at the hour of 12 o'clock, m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. O. J. EATON, Secretary. Office removed to room No. 7, same building, San Francisco, California. cc-29

POSTPONEMENT.—The above sale is hereby postponed until Saturday, January 17th, 1874, at the same hour and place. By order of the Board of Trustees, O. J. EATON, Secretary.

POSTPONEMENT.—The above sale is hereby postponed until Monday, February 16th, 1874, at the same hour and place. By order of the Board of Trustees, O. J. EATON, Secretary.

Germania Mining Company.—Location of

principal place of business, San Francisco. Location of works, Tintic District, Juab County, Utah Territory.

Notice is hereby given that at a meeting of the Board of Directors, held February 24, 1874, an assessment of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 408 California street, Room 16, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 15th day of April, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, J. TRIPP, Secretary. Office, 408 California street, Room 16, San Francisco, California. feb-1</

HENDY'S IMPROVED CONCENTRATOR.

Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

JOSHUA HENDY, Esq.—Dear Sir:—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.
I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,
Yours respectfully,
409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, April 27, 1873.

JAS. H. CROSSMAN, M. E.

SAVING MONEY.—The report of O. C. Hewett, Superintendent of the Keystone Consolidated mine, in Amador county, is to the effect that they have saved about \$5,000 per month by the abandonment of blankets and buddies and the use of Hendy's Concentrators. The Concentrators have been in use there about five months and of course give great satisfaction, as they have performed their work so well.—SCIENTIFIC PRESS, Jan. 10.
The Superintendent, O. C. Hewett, reports that a saving of about \$5,000 per month is arrived at by the use of these Concentrators.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:
EMPIRE MILL. (3 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....Grass Valley, Nevada County.
VULTURE CO. (8 Concentrators).....Prescott, Arizona.

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Made and sold by California Brass Works, 125 First street, S. F. 24v23tf

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 20-0 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, \$600.

G. D. CROCKER,

per ounce Troy at different degrees of fineness, and val-
uable tables for computation of assays in Ores and
Grammes, will be sent free upon application.
7125-4f JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.
The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces. —
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surface and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.
Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in
contact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates,
for Saving Gold.

CALIFORNIA Quartz Crushing & Ore Sampling MILLS.

Nos. 413 & 415 Mission st., bet. First & Fremont, S. F.

Ours is the OLDEST, LARGEST and MOST EXTEN-
SIVELY KNOWN establishment of this kind on the
Coast.

Our mills are under the direct supervision of one of
the most experienced Samplers and Millmen in the
country, and we purpose carrying on the business upon
a scale commensurate with the wants of the mining
public.

We have the best facilities for Crushing, Sampling
and Privetizing all classes of Gold, Silver, Copper and
Lead Ores and other minerals.
We also crush and pulverize all kinds of Marble,
Fire-Clay, Bricks, Cement, etc., upon the shortest
notice, for which we have special mills.

Reliable information furnished to miners and ore
dealers concerning shipments, freight, prices, etc.
Prompt execution of all orders. Faithful attention to
business entrusted to us.
Abundant storage room without extra charge.

Jan 31-11 "JIM" WHITLATCH, Supt.

E. N. RIOTTE, JAS. L. BEEBE, S. O. BROWN. AUBURN MILL COMPANY, Reno, Nevada.

Purchase Silver Ores in quantities of ten tons and up-
ward, delivered on board the cars at San Francisco or
Oakland at the annexed Net Rates, WITH NO CHARGE FOR
SAMPLING OR REDUCTION. On lots of less than 10 tons,
freight to Reno will be deducted.

Special Rates for Gold Ores.
On Gold contained in Silver Ores to the amount of \$30 and
upward, 65 per cent. will be paid. When less than \$30, and
above \$10, the amount will be added to the Silver value.
Sacks promptly returned free of charge. Ores sampled
by Battery or Sampling Mill as shippers may elect, and re-
turns made promptly by cheque on San Francisco.

Corner Howard and Beale Streets,
Are prepared to make SHEET IRON AND ASPHALTUM
PIPE, of any size and for any pressure, and contract to
lay the same where wanted, guaranteeing a perfect
working pipe with the least amount of material.
Standard sizes of railroad Car Wheels, with special
patterns for Mining Cars. These small wheels are made
of the best Car Wheel Iron, properly chilled, and can be
fitted up with the improved axle and box—introduced by
this company, and guaranteed to outlast any other
wheels made in this State.
All kinds of Machinery made and repaired.
21222-3m JOSEPH MOORE, Superintendent.

GALVANIZED IRON.

For sale for cash, at 50 per cent. less than market
prices—Nos. 20 to 28. Also Galvanized Leaders and
Chimney Tops and Hydraulic Pipe manufactured.
MARTIN PRAG,
125 Olay street, below Davis.

CALIFORNIA THEATER.

BUSH STREET, ABOVE KEARNY.
JOHN McCULLOUGH.....Proprietor and Manager.
MR. BARTON HILL.....Acting Manager.
OPEN EVERY EVENING.
With the best Dramatic Company in the United States.
Box office open from 9 A. M. to 10 P. M. Seats
may be secured six days in advance.

DION BOUCAULT.

Prices of Admission:
Dress Circle and Orchestra.....\$1 00
Dress Circle and Orchestra, Reserved.....1 50

HEALD'S
BRYANT & STRATTON
BUSINESS COLLEGE
24 POST ST. SAN FRANCISCO
OPEN TO ALL
SEND FOR CIRCULARS

The object of this school is to impart a thorough edu-
cation in business affairs. It is open to persons of both
sexes and of all ages. There is an English Department
for those not sufficiently advanced for the Business
Course. Sessions continue day and evening throughout
the year. Students can enter at any time. All wishing
to be successful should secure a practical education at
this College. Send for "Herald's College Journal," and
learn full particulars. Sent free to all by addressing
E. P. HEALD, Pres. Business College, San Francisco,
Cal. 21217-17

MECHANICS' INSTITUTE, 27 POST STREET.

Course of 15 Lectures on Popular Science,
BY THE
PROFESSORS IN THE STATE UNIVERSITY,
Commencing Saturday Evening, Jan. 3, '74.
Tickets for the course, Two Dollars. The number of
tickets being limited, application should be made at
once to the Librarian's desk, Mechanics' Institute.
Jan 10-1f

REMOVAL.

THE OFFICE OF THE OPHIR SILVER MINING
Company has been removed to Rooms 1 and 2 Hayward's
Building, 419 California street.
Jan 10-1f JOSEPH MARKS, Secretary.

REMOVAL.

THE OFFICE OF THE ECLIPSE, WINTERS AND
Plato Consolidated (Gold Hill) Mining Company has
been removed to Room 3 Hayward's Building, 419 Cal-
ifornia street.
Jan 10-1f JOSEPH MARKS, Secretary.

F. A. HUNTINGTON'S PORTABLE SAW MILL.

THESE MILLS ARE BUILT IN THE
STRONGEST, MOST DURABLE

Workmanlike Manner,

CAPABLE OF DRIVING ANY SIZE SAW

Up to sixty four inches.

THEY ARE FURNISHED WITH
IMPROVED FRICTION FEED &
GIG BACK,

Both being operated by the same lever, no
belt being used to gig back.

THEY ARE CAPABLE

Cutting from 8,000 to 12,000 ft.

PER DAY.

SAW MILL MACHINERY

Of All Descriptions

FURNISHED TO ORDER.

MANUFACTURED AND FOR SALE BY

F. A. HUNTINGTON, 143 and 145 Fremont Street,

SAN FRANCISCO.

Also, HUNTINGTON'S PATENT SHINGLE MACHINE.

For Simplicity, Durability and Rapidity of Action, these machines have no equal—cutting from 3,500 to 4,000 per hour. They are now used by all the principal mill-men on the Pacific Coast.

STEAM ENGINES, SAW MILLS, PLANING, LATH AND PICKET MACHINES, ETC.

CLOBE IRON WORKS, 143 and 145 Fremont Street, S. F.

DEWEY & CO'S Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reason of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent soliciting business, obtaining Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. ADVICE AND ORIGINALS FREE.

rail or stage. 87-3m-16p-sp

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1.

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.
Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

General Agents, No. 210 Front Street.

MINING AND SCIENTIFIC PRESS

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, FEBRUARY 14, 1874.

VOLUME XXVIII
Number 7.

Morris' Settler and Amalgamator.

The accompanying illustration represents an improved settler, recently patented through the Scientific Press Patent Agency, by Fredrick Morris of this city. It merits the attention of the mining community not only for its unusual cheapness, but for its efficiency in working and novel method of discharge. The machine has been in practical operation for some little time in this State and in Idaho. A fact that will attract the attention of all mill men is that the settler gains quicksilver in working tailings, as has been repeatedly proved in practice. The sides and bottom are made of wood, as are also the mullers, leaving only the running gear of metal. This, in itself, is an important feature, as it is easily and cheaply transported, as well as easily and cheaply made and set up. The castings, gear, etc., weigh altogether only 520 lbs.; the largest piece weighing 135 lbs. The whole thing will weigh no more than the bottom alone of an ordinary settler. As will be seen in the detailed description of the settler, the bottom is made of wedge-shaped blocks, fastened in a peculiar manner, so that there is not the slightest danger of the bottom bulging or getting out of place. The action of wood against wood brightens the quicksilver without "flouring" it, as any miner knows. The bottom blocks, used by Mr. Morris in the settler running at his place, were made of common redwood, and the revolving action of the mullers slightly roughens it, giving the quicksilver a chance to become brightened without "flouring." Soft wood is preferable to hard for this reason.

By referring to this cut the operation of the settler can be seen:

A represents a tub or vessel, which can be made of wood or iron, in the center of which rises the muller-supporting standard, *b*. The bottom of this vessel is covered with a layer of wooden blocks, *c, c*, placed with the grain standing vertically. Radiating wooden strips, *d, d*, separate the sections of blocks, *c, c*, at intervals extending from the center to the outer edge of the bottom. These strips *d, d*, consist of boards placed edgewise between the triangular sections of blocks and so that their upper edges will be somewhat lower than the surface of the blocks, *c, c*. Around the outer edge of the bottom a channel or deep groove is made between this wooden bottom and the side of the vessel, for the purpose hereinafter explained. The mullers, *G*, are also constructed of wooden blocks secured to the muller-arms with the grain of the wood standing vertically, so that all of the wear upon the muller and bottom will be upon the end of the grain of wood. By employing wood in this manner—for the bottom of the tub and for the muller—much better results can be obtained in the process of settling. The channel formed by the depressed strips, *d, d*, serves to convey any particles of quicksilver, which may become separated, to the annular channel around the edge of the bottom of the vessel.

In order to draw off the water from the vessel a siphon, *h*, is employed which is secured upon the edge of side of the vessel so that its inside leg will come almost to the center of the pan. By means of this siphon the operator is enabled to draw off the tailings or slime from the center of the vessel, where, by reason of a less amount of agitation than at the sides, an eddy is formed, which is more favorable for allowing the heavier particles to settle than at any other point in the vessel; while at and near the sides the greater speed of the muller keeps the pulp in constant motion, so that a portion of the amalgam will always be drawn off with the tailings when the discharge is at the side.

This settler draws from nearer the surface than our engraving would indicate. It can be made of metal or common rubber hose, as is most convenient. The settler is easily cleaned up in half an hour, as the blocks can be removed without trouble. Making its sides of wood is a new and economical feature, as it saves cost of iron and transportation. The castings can be sent to any mine, and the frame work, mullers, sides and bottom, can be made by any carpenter. The blocks are set on edge like those in pavements, or in sluices,

and are easily changed when worn down. The wear and tear amounts to very little, as wood is cheap in the interior, and a neighboring tree will furnish all the blocks necessary. It will not cost more than \$4 or \$5 to make a new set of mullers, and new blocks for the bottom. Very little power is necessary to run the settler as the arms and mullers are light and the settler draws off the slime continuously. The wooden mullers and blocks can be used in iron bottoms, so that pans already running can be altered easily. The idea of using wooden bottoms is not new, but Mr. Morris' method of doing so is new. Although very simple it answers the purpose excellently, and the wedge-shaped bottom blocks do not bulge or crack. His idea of drawing the slime is a good one, as any mill man will readily see.

Locomotive Bell Ringers.

Engine number eight, belonging to the S. P. R. R., is one of Booth's make, and was built expressly for yard work, it having to make up trains, do the switching, and all the general work of moving cars in the yard and about the depot. Since its first advent on the road, it has done some good work, and as a natural consequence it began to show visible signs of wear and tear, that refused to allow themselves to be overlooked; consequently she was hauled off the road, and put on the stocks in the machine shop for general repairs. Her inside fire-box was found to be in a very defective state;

MORRIS' SETTLER AND AMALGAMATOR.

Mr. Morris furnishes whole pans if desired, but prefers to sell only the castings and let the miners put up the woodwork themselves, as it is easier made on the ground. Parties owning mines or localities where freight is high and roads bad, as in some of our mountainous districts or in Mexico, will be glad to know there is a settler which will not cost a fortune to transport. Mr. Morris informs us that he will furnish these pans complete for \$250. He will furnish castings and right to use for \$175. He has been very successful in separating magnetic iron amalgam with this pan, in localities where the magnetic iron created difficulty in pans. One of these settlers is running daily at Mr. Morris' office, 616 Merchant street, where those interested can see it.

CROWN'S ENGINE, which we described last week, has been placed on a dummy locomotive on the Alameda horse car line in San José. The locomotive was put up at McKenzie's foundry, by Mr. Mitchell. It is said to possess great speed and power, though it is quite small. It will be run outside the city limits, as the authorities will not allow it to run in the city.

MINERS are leaving Pioche daily for the Stickeen country. They will rendezvous at Victoria, B. C., until the weather will permit of their going to the mines. From all accounts the Stickeen River country is a pretty severe one to work in.

this was taken out bodily, and a new one put in its place by the foreman boilermaker, Mr. J. Kelshaw, who also put in a new set of flues. The link motion, slide valves, axle boxes, and all the general machinery of a locomotive, were carefully examined, and thoroughly repaired, so that when a few days ago the engine took up her old position in the yard, it was with a feeling of safety, satisfaction, and pleasure that the engineer saw her settle down to the work, just as good again as when she first left Mr. Booth's shop.

But there was one new feature added during the sojourn in the machine shop, that could not but arrest the attention of any passer by who might be near, while the engine was in motion. This is what is popularly styled the bell ringer, or the "lazy fireman's assistant." As the engine is continually at work at various points about the city, and in consequence repeatedly crossing and recrossing the streets, it was deemed essential to adopt some method by which the bell should be continually sounded as a warning to those near, and as the employees in charge of the engine could not be always pulling at the bell rope, an extra hammer has been affixed to the frame of the bell, which, by means of rods and levers, is alternately raised and allowed to fall again, striking the bell as it does so. Motion is communicated by the eccentric, thus giving one blow on the bell for every revolution of the driving wheel. But if the hammer were allowed to strike the bell and remain there until

lifted for the next stroke, of course it would kill the sound. To counteract this difficulty, a cleverly arranged spring, thoroughly tempered, is placed in such a position, that the force of the downward blow allows it to give enough for the hammer to strike the bell, yet on the very instant of striking it lifts the hammer from the bell, thus enabling the apparatus to strike a good ringing blow, so essential on the locomotive. Although looked at from a mechanical point of view there are faults and blunders in its construction, yet the idea is good, and we should thank the S. P. R. R., for having adopted it, and the genius of its inventor for having used his brain to such good purpose. Its chief faults are that the hammer is too small, and the fall too little. Altogether it gives the idea of being in a cramped position, and too close to the bell. If the fulcrum had been thrown further out, and a longer lever and heavier hammer attached, the results would have been more satisfactory; as it is, the sound produced is not loud enough. But as this is a maiden attempt of this style of bell ringer, at least in this city, it would be ungenerous to be too critical, but we will accept it in the spirit with which it is offered, as expressing a desire on the part of the railroad authorities to do all in their power, to avert the danger of any casualty occurring on their all too exposed road in and about the city.

Another style of bell ringer for locomotives has been in use some little time past on the C. P. R. R. on the local road from Oakland wharf to Brooklyn and Alameda. On that road there are three trains running continually from half-past five in the morning until half-past twelve at night. These trains run through the streets for most of the distance. The bell ringer on those locomotives is so arranged as to work by steam, but is not connected with the running gear of the engine. A very small independent cylinder is attached to the rear end of the boiler near the cab-window, and its piston is connected to a short crank on the trunnion of the bell by means of an iron rod. By this means the bell is made to ring continuously and at regular intervals, without reference to the speed of the engine. It can also ring when the engine is not in motion, an advantage not possessed by the other bell ringer spoken of above. By so doing the bell can be rung before the engine starts up without having to handle the usual bell rope. We have often heard people express surprise as to how the engineer or fireman was able to keep the bell ringing with such unvarying regularity of stroke for so long a time, when they did not know that machinery was doing the work. It is found very convenient and advantageous, and some device of the sort should be used on all local roads and on yard engines where there is any danger of accident. This also is, we believe, a California invention.

How Mark Twain Got "Beat."

Our friend, Almarin B. Paul, tells us a pretty good thing on "Mark Twain" as a quartz sharp, which we do not recollect ever hearing Mark say much about, in his mining experiences. Perhaps he was afraid of incorporating too many facts in his book, and this came to near home to suit him. Just after Mark returned from the Sandwich Islands to this city, he was hard up for something to do if not for coin; and to make a raise, concluded to do what many others in a like situation were trying to do—sell a mine belonging to a friend. Among others, he consulted Paul on the subject, who like all the others gave him plenty of advice if nothing else. Mark's plan was to make a large interest in the mine clear. His arrangements went on very nicely; his descriptive and persuasive powers were irresistible, and the mine was sold. When this happy consummation was reached, Mark, of course, expected to have his interest, which was not forthcoming as anticipated. It ended by his not getting the interest at all. One day Paul met him and asked how it was he "got beats o' bad." "Wall," says Mark, "the fact is, I talked so well and made the feller believe the mine was so valuable, that he couldn't help but take it all."

THE SATURN SMELTER at Sandy, Utah, has cleaned up 11 tons of base bullion in 26 hours' run.

Bullion Product of Nevada.

The *Territorial Enterprise* says: The estimates by Wells, Fargo & Co. of the bullion product of Nevada for 1873, as published by us on the 1st of January, is \$35,264,507. This gives \$881 to the inhabitant, estimating our population at 40,000. This is an increase over 1872, estimate made by the same firm, of \$13,177,462, the total product for that year being put down at \$22,077,045. The question naturally arises: Will the mines of Nevada increase their bullion product of 1874 over that of 1873? If this question is answered in the affirmative, then on the Comstock lode depends not only the increase, but, it would seem, nearly the whole production. From present appearances, the mines in the eastern portion of the State, with the exception of those in Eureka, will prove to be almost barren of product this year. The great Raymond and Ely mine of Piocha is flat. A report of the condition of the mine has been published. Its condition is little better, if any, than was stated by the San Francisco *Chronicle*. Its total liabilities are set down at \$125,000, and its assets at 184 tons of ore, there being no cash on hand. Its production for 1873 has been \$2,500,000, and its expenditures the same amount. This has brought its stock in the Board down as low as \$26 per share, and where it will stop time alone can tell. Then there is Belmont, about which so many stories were told only a few months ago. Its stock has dropped to \$5.50, and the reports concerning the mine are very discouraging. We are sorry for these facts and statements. They show instability in mining, outside of the Comstock.

Every one remembers the marvelous richness of White Pine, the pure horn silver taken from the Ebshardt and Consolidated Chloride Flat mines, and how soon the ore was exhausted. Now the mines of Piocha, developed after the exhaustion of the White Pine mines, are flat in the market, and give no promise of large bullion production this year. But the mines of the Comstock never looked so well as now. They will produce more bullion this year than in any previous one since their discovery. The Belcher and Crown Point, the two great dividend paying mines, never showed such large bodies of ore as at present. They will continue to pay large and regular dividends throughout the year. The Consolidated Virginia will also become a dividend paying mine shortly. Then there is hope that the Ophir—once one of the richest of them all—will resume its old place in the list of dividend payers. The Consolidated California is heir to a portion of the rich body of ore now being worked by the Consolidated Virginia. And all along the line, between the latter named mine and the Crown Point, ore bodies are liable to be struck at any time. And the deeper they are found the greater they become. Commencing with the month of February, 1863, and ending with December of that year, eleven months, the Gould and Curry mine took out the sum of \$3,900,000. This was considered an extraordinary yield that it was harried throughout the world. Last year Belcher distributed nearly double that amount in dividends, and its ore body looks better now than it did a year ago. The permanence of the ore bodies possessed by the Crown Point and Belcher will do much towards stimulating prospecting southward of those mines, and even to the northward of Ophir. What the results will be time alone can determine. But no one conversant with the condition of our mines to-day doubts that the bullion products of the Comstock will be largely increased in 1874 over 1873. That it will produce more than the entire State did last year is not only possible but probable.

Quartz Mines of Sierra County.

The Sierra Buttes mine, now regarded as the most valuable and extensive gold mine of Sierra county, and, perhaps, in the State, is situated on a steep mountain side, 1,500 feet above the valley of the south fork of the North Yuba, and about 5,000 feet above the level of the sea, three-fourths of a mile from Sierra City and twelve miles from Downville. The mine is situated upon a lode which is split up into three branches with intervening lodes of hard blue slate between of the same character as the lodes. The principal branch is called the Ariel ledge, and one of the other two is known as the Roae. The course of the lode is northwest and southeast, and the dip forty-five degrees to the northeast. The rock is extracted through tunnels, of which there are seven. The lowest is on a level with the mill, the horizontal distance from which to the uppermost workings is 1,400 feet. The altitude of the mine above the Yuba gives splendid facilities for working and drainage for years to come, and there is a probability of the mine being worked and drained through tunnels to the depth of 3,500 feet in the lode. The Sierra Buttes Union Company having recently purchased the claims of the Buttes Union Company, rumor says for \$10,000, there has been a dispute for some time between these companies in regard to the boundary line between the claims, and this purchase and sale has settled the matter at issue to the satisfaction of the parties concerned.

This mine has been worked without interruption for twenty-two years, up to the present time. From 1855 to 1857, by Messrs. Wood & Illingsworth. It was at first worked with arrastra, and the quartz rock carefully assorted, averaging from forty to fifty dollars per ton. The amount of gold taken out, up to 1857, is estimated at \$250,000. In 1857, Alexander Baines and Reis Brothers purchased the prop-

erty; two miles were constructed, one of sixteen and the other of twelve stamps, both being worked with the same water, one below the other. The water was conveyed by a flume to the mill from the neighboring ravines. During the summer season, the supply of water not being sufficient to run all the stamps, the Reis in connection with the Independence Company, had a survey made for the purpose of ascertaining the feasibility of procuring water from the lakes on the north side of the Buttes. Finding that water could be had from this source, a flume and ditch, seven miles long, and two and a half feet wide, was constructed, conveying the surplus waters of the Sardina lakes to the mine. Half of this water was taken to the Independence, and a portion back again to the Sierra Buttes mine. This mine was worked by the Reis Brothers with varying success for thirteen years. What the gross or net proceeds have been during this time we are unable to say. It is known, however, that they have acquired a large fortune.

In 1870 the present owners, an English Company, purchased the property for \$750,000. They have been to an immense expense in putting up substantial buildings and the most improved machinery. A forty stamp mill was built in 1871. In 1872 the two old mills were taken down and one's twenty-four stamp mill and another of twenty stamps were built on the same ground. The old flume, built by Reis, conveying the water from the lakes to the mine was taken down and a substantial flume, three feet wide, constructed in its place; branch flumes, were built conveying the water from Packard and Salmon lakes to the main flume. Dams were constructed across the outlets of these lakes to retain the water in the spring which is let out into the Company's flumes as fast as needed, and several new and substantial buildings have been erected in the vicinity of the mine, among which we might mention three large boarding houses, one two hundred feet long and three stories high, capable of accommodating two hundred men. A good road was built from the timber regions at the head of ladies' Cañon to the mine. This road has an easy grade, is two miles long and twelve feet wide in the clear in solid ground.

The Sierra Buttes quartz ledge is the first quartz location in Sierra Co., of which there is any knowledge. It was discovered in the summer of 1850. Old residents well remember the great excitement at the time, caused by the discovery. There was a general stampede for the Butte to secure claims, and several locations were made. A public meeting was called to meet at Craycroft's saloon in Downville, for the purpose of framing quartz laws for the district. At this meeting J. Webb Nicholson, a one-armed miner, subsequently County Clerk of this county for four years, was elected quartz recorder, and the sequel will show it proved to be a very profitable office. The quartz excitement was intense; everybody talked quartz, and a man who did not own a quartz claim considered himself unfortunate.

Scores of excited men traveled over the mountains hunting for quartz. Some, taking lanterns to assist them in their explorations at night; and whosoever a quartz boulder appeared above the surface of the ground, a location was made and recorded. The quartz excitement was about subsiding, when rich croppings were found on the point of the ridge north of Downville, now known as the Wheeler ledge. As soon as this discovery was known, the hill-side was alive with men, each anxious to secure a claim for himself and friends. Trees in the neighborhood were patched with notices. About two hundred locations were made, and if some of the parties were to have a survey made to ascertain the whereabouts of their claims, they doubtless would be astonished to find that they extended far beyond the boundaries of Sierra county.

THE FLUME BUSINESS.—The flume business is assuming a shape which gives hope that we shall have plenty of wood, water and lumber in Grasa Valley, at an early day, and at reasonable prices. Gentlemen connected with the South Yuba Canal Co. will take stock in the proposed flume or flumes, and that fact will guarantee that water for floating lumber down from the mountains can be had all the year, save when snow and frosts interfere. We understand that over in the Truckee region the Prosser Creek flume, which is about 7 miles long, cost about \$27,000, and the flume 5 miles long cost about \$25,000. Mr. Seth Martin, of Truckee, who has had much experience in building flumes, and who is well acquainted with the topography of the country over which the flume of Nevada city and Grasa Valley will run, thinks that from \$1,200 to \$1,500 a mile will be the cost of such flumes. The flumes for floating timber require less grade than do the ditches used for conveying water to the mines, and they will do effective work with as many curves as may be necessary in their construction.—*G. V. Union.*

SHIPBUILDING ON THE CLYDE.—The shipbuilding trade of the Clyde for the year just ended shows no falling off in that branch of industry. The actual number of vessels built was smaller than in some preceding years, but the aggregate tonnage was much larger. Last year the aggregate tonnage launched was 37,506 tons above 1872, 65,300 tons above 1871, and 71,700 tons above 1870. The foreign services, for which the larger vessels have been built, are the following: East India trade, 30; China, 15; South America, 18; New York, 20; Canadian, 1; Spanish, 5; Mediterranean, 9; French, 8; Baltic, 4; Australian, 10.

Calistoga Mines.

A correspondent of the Napa *Register* says: On Saturday morning quite an excitement was created here by the report of another discovery of a gold and silver ledge. This discovery was made by Messrs. J. W. Norton and R. S. Hanson, and is about 1½ miles distant and in full view of town in a northeasterly direction, and is called the Calistoga Ledge. This ledge crosses the new proposed Knoxville road, is well defined, and can be traced for a distance of one mile. The lucky owners feel "bully," and are already laying plans for a good time, fast horses, plug hats, etc. Some of the rock was sent below on Tuesday for assaying. Alar Badlam was up again on Saturday, and informs us that preparations are being made to erect a mill at the Mt. St. Helena mine, to be built as soon as spring opens.

Budd Philpot brought down 15 flasks of quicksilver from the Sonoma mines on Saturday last. I understand that there are a number of flasks at Pina Flat taken from the Missouri, awaiting transportation. The fever is running so high at Pina Flat that Gresh Thompson informs us that the ladies of that thriving little burg spend their leisure hours in prospecting the hills for cinnabar, and often come in with aprons full of rocks. Rav. Mr. Daubenspeck arrived from Pina Flat on Tuesday, and says he has struck it "big"—has got enough to make him rich, and then he will have nothing to do but "blow the gospel trumpet." Quite a skirmish took place at Pina Flat on Sunday evening between two of our former citizens. Considerable blood and hair was "thrown around loose," but both parties still live.

IRON MANUFACTURE IN THE COLONIES.—A communication which we have received from Sydney should make masters and men in the iron trade pause before allowing the wages question to interfere with the result of their united labor. We are told, upon what appears to be reliable authority, that within the last few months discoveries have been made in New South Wales which will shortly enable that colony to supply iron of superior quality cheaper than any other part of the world. At the present time the iron works of New South Wales and Victoria only work up scrap iron, on account of the fact that the necessary materials for the manufacture of iron have not been found within easy distance of one another. Now, however, such discoveries have been made that the chief necessity for a large production of iron at a small cost is that of a few ironmasters with a knowledge of the value and mode of development of such property as easily obtainable. Capital is abundant in the colonies; it is knowledge of the trade that is required. It is stated that so favorably situated as regards minerals are some parts of North South Wales, that coal, ironstone, or limestone can be put in the furnace for 5s per ton, and our informant calculates that pig-iron could be made in this colony and delivered in Wolverhampton at a cost not exceeding £4 per ton, or a little more than half the present price of pig-iron. The materials for the production of iron extend over very many thousands of acres in these colonies. One piece of land, of about 2,000 acres, contains these materials within about 4 miles; that is to say, in one line, there are 2½ miles between the coal and the limestone, and 1½ miles between the limestone and the ironstone. This is the case near Wallarawang, 3½ miles from a railway station, and 105 miles from Sydney. Our Australian correspondent is known we believe, to several of the leading firms in South Staffordshire, and we have every reason to think that his statements and deductions are quite reliable. If so, the influence the discovery may have upon the iron trade of this country can hardly be over-estimated. Those who know the immense resources of our Australian colonies, and the field for enterprise which they open up, will recognize the importance of the statements we have made. They may be the commencement of such a revolution in the iron trade as may entirely change the circumstances of this district, with its worked out collieries and its numerous trade disputes. As we said at the commencement, masters and men should learn a lesson from the report, let them "make hay while the sun shines."—*Wolverhampton Chronicle.*

YUBA COUNTY COPPER MINES.—One ton and a half of pure copper was shipped from Wheatland on Saturday, the 31st ult., to J. Hendy, San Francisco, taken from the mine of the San Francisco Copper Smelting Company, located at Spencerville, about ten miles from Wheatland, where the company have large works erected for smelting ore. The shipping of copper from Wheatland this summer will be quite an item, as already quite a quantity of ore awaits smelting. They have gone to great expense in the erection of their works, and they are proving a success beyond a doubt. A great many old claims that were abandoned will be worked and made to pay, as the pure copper will be shipped in the future, instead of the ore as heretofore.—*Marysville Appeal.*

KLAMATH RIVER DEPOSITS.—At the Legislature, Irwin has offered a long, concurrent resolution, reciting that under the Klamath river it was supposed there were rich placers, and that if the river could be tunneled, rich mineral deposits would be likely to be discovered, to the great advantage of the State; and that Congress be solicited to pass a bill granting to Edward Bean and his associates the right of way for such tunnel, and title to so much of the bed of the Klamath river as may be drained. Referred to the Committee on Mines and Mining.

The Nevada Ice Company's Works.

We extract from the local columns of the *Truckee Republican* the following account of the method employed in gathering and storing ice at the works of the Nevada Ice Company, between Prosser creek and Boca. It will be found interesting, and the magnitude of the business merits attention:

The ice buildings are three in number, each building being 200 feet long, 35 feet wide and 20 feet deep. These buildings run parallel with each other, and are separated only by a partition. The ice is drawn up from the pond into the end of the building on two endless chain elevators. These elevators are 220 feet in length, and pass over a grooved tramway about two feet wide. Attached to the endless chain every ten or twelve feet, and on the upper side, is a wooden block. In revolving, the chain or elevator reaches down beneath the surface of the ice pond. The ice is cut into blocks about 20 inches square, and floated to the spot where the elevator, with the wooden blocks fastened to it, emerges from the water. The blocks catch the square "caks" of ice and hurry it up the tramway to the top of the building, from whence it descends on an incline made of scantling to such a point in the storage room as may be desired. The chain elevator moves about as fast as a man can walk, and from ten to twelve cakes of ice are moving upward at one time. The ice company were storing yesterday was about sixteen inches thick, and the cakes passing up would average about 300 pounds each. With both elevators in full operation, we were informed that no less than fifteen tons can be sent up per minute from the pond to the building.

From 3 o'clock Monday afternoon until last evening (about twenty-three working hours) the company elevated from their pond and stowed away 4,000 tons. A portion of this time only one elevator was used. To accomplish this task sixty-five men were employed on Monday and Tuesday, and less than fifty on Wednesday. About one-third of this force was required to saw the ice into blocks of required size and float them along to the elevator. The remainder of the force were busy inside the building receiving the ice and storing it away in regular layers. For working the elevators a steam engine of thirty horse power is used. The company's ice pond covers about four acres. Water is obtained by a dam thrown across the river immediately above the pond. At the lower end of the pond is a sluice gate ten feet wide. In case the ice should be covered with snow, all the company have to do is to turn on a flood of water from the river, and the snow is swept away from the sluice-gate. If the company should have their pond filled with poor ice, unfit for storage, they saw or break it up into large cakes, and turning on the desired head of water from the river, it is floated out through the sluice-gate in a similar manner. The company have in their buildings about 7,000 tons of ice. The storage of the three buildings is 10,000 tons. If the ice season warrants it, they will put up 8,000 tons more. Last week they loaded and shipped forty cars, carrying 400 tons, in one day. This shipment was for the Railroad Company, and was sent principally to Wadsworth, Humboldt City and Carlin. The Railroad Company has ice houses at those points for the purpose of supplying passenger trains on the alkali deserts of Nevada in the summer time with cooling beverages. The Nevada Ice Company was incorporated in 1870.

MONTANA QUARTZ MINES.—A recent issue of the *Dear Lodge Independent* contains the following item: We received a specimen of very rich ore, taken from the Trappar lode in Beaverhead county. The sample was sent by Chas. De Lorimer, and Wm. Purvine writes as follows: "The sample sent will assay at the rate of \$3,000 per ton. The ore as it comes from the mine assays—first class—from \$300 up in the thousands, and will average \$600 per ton; second class, from \$100 to \$250 per ton; and third class, from \$40 to \$100 per ton. There is now about 30,000 worth of ore on the several dumps, with an abundance in sight in the various lodes, all of which are looking well. The mines are easily worked, the principal tools required being the pick and shovel. The district is easy of access, and only about \$2,000 will be required to complete a good wagon road from Brown's Bridge, on the Big Hole, to the Trappar lode, the building of which has been proposed. Sixteen men are now engaged in the mines, and all believe that the district will very soon be making regular shipments of bullion that will surprise all that have not seen the mines." Certainly our quartz interests are looking up, as almost daily we hear of important discoveries being made—among them, many lodes containing ore that pays well for shipment.

IN LUCK.—The Nevada *Transcript* of the 1st inst. says: J. H. Helm, superintendent of the Gold Tunnel mine, is in luck. He has long been engaged in prospecting the mine, hoping to strike a lead that would pay him for his outlay and time. But for weeks and months things looked despairing, so much so, that on more than one occasion, Mr. Helm felt disposed to give the thing up as hopeless. He, however, like a drowning man that catches at a straw, persevered, and now has the gratification of knowing that his labors, toils and expenditures were not in vain. He has struck a ledge three feet wide, that is said to be extremely rich in gold deposits, that will pay on an average \$100 to the ton.

MECHANICAL PROGRESS.

The Wiard Gun.

Several important competitive tests of heavy ordnance have recently been made by the government ordnance officers at Boston. For the purpose of the experimental test there were provided two guns of 23 tons each, and of 13 inch caliber. One of them was the common smooth-bore, and the other was rifled in accordance with Mr. Wiard's invention, but in other respects there was no difference whatever. One hundred and forty pounds of powder—the largest quantity of ammunition ever used in a gun—was fired from each, and the projectiles were respectively of 460 pounds weight. The targets consisted of wrought-iron plates of 15 inches in thickness; and they were erected side by side, 150 feet distant. The projectile was conical, while the one fired from the common smooth-bore piece was necessarily round. The one first named went clean through the 15 iron plates, and out of sight into a sand bank in the rear. The demolition of the almost invulnerable target was complete, and so great was the force with which it was struck that a fragment of 300 or 400 pounds was thrown clear across the island, a distance of not less than a quarter of a mile. The projectile from the smooth-bore gun penetrated the target only about $6\frac{1}{4}$ inches, and as the advantages were precisely equal the superiority of the rifled arm was at once established by the experiment, and admitted by the government authorities of observation. Compared with other competitive tests, this style of gun is the most destructive ever yet produced. A 35-ton gun of 12-inch caliber once fired in England through an iron plate of 12 inches in thickness, showing the comparative penetrating power of that arm to be about 144 against 225 of the gun at Nat Island.

This improvement, as the government understands it, does not involve the manufacture of new guns to secure it. Take the present armament of our forts, just as they are, and they can be rifled at one-tenth the cost that new guns can be manufactured, and, at the same time, their efficiency as smooth-bore ordnance is not in the least impaired; and, including the cost of rifling, the arms will be cheaper by one-tenth than the best English guns, and for destructive powers their efficiency can hardly be equalled.

Under this improvement it is claimed that the rifled guns belonging to the United States government may be made to have greatly increased efficiency, endurance, penetration of iron plates, higher initial velocity to the shot, much longer range and improved precision; while the guns of the smooth-bore will remain essentially as good, or be better, smooth-bore guns than they now are, and, if rifled, they may be, after the improvement is applied, used effectively as smooth-bore guns if desired. By this means all the spherical projectiles now on hand may be utilized, and all carriages, implements, platforms, ordnance stores and service of the gun may be made available. The improvement consists in rifling each gun with two grooves, having for a 15-inch gun a twist of about one full turn in 50 feet, and so stationing the grooves at the side of the bore that neither groove will intersect or cross the bottom or top of the bore, thus leaving it smooth at the bottom and top where the shot would strike in "ballooning," should the gun be used as a smooth-bore for spherical projectiles after being rifled.—*Iron Age*.

NEW AGRICULTURAL MACHINE.—The *English Mechanic* says: Messrs. McDonnell and Lanchan, of Dublin, have invented a machine which performs the operations of rolling, sowing and harrowing simultaneously. The roller is of wrought iron, riveted on cast iron wheels, forming a cylinder six feet in length by three feet in diameter. Immediately above the roller is a sowing apparatus, by which the seed is rapidly delivered, a star wheel of four points keeping the conductors in constant motion. As the seed is sown, a harrow of four rows of oblique teeth, set in a central axis, turns up the earth over the seed. The harrow is kept in motion by an endless chain or belt which passes round the extreme end of the large cylinder, and fits the groove of a small wheel at the corresponding end of the harrow. Every time the large roller turns over, the circular harrow turns nearly five times, causing the teeth to tear up the soil about twenty times at each of the revolutions. Meantime the seed conductor and distributor rises and falls twelve times during each of these revolutions, and there is a contrivance by which the quantity required to be sown can be regulated. A lever is also connected with the supports of the harrow, and rests upon a fulcrum placed at a suitable part of the frame of the machine. By means of this lever, the harrow portion of the machine can be raised off the ground and the roller only used; and the distributor or sower may be worked simultaneously, by means of the chain-belt, which can be closed, and the flow of seed stopped. The machine can be easily made to suit either the purposes of sowing corn or grass for pasturage.

DETROIT is to have a self-propelling steam fire engine. Its preliminary trial in Manchester, N. H., resulting satisfactorily, as it climbed the various grades it had occasion to ascend very easily, and turned corners with little if any loss of power.

An Ancient Lathe.

In continuation of articles recently published in this journal, on anticipated and parallel inventions, we take the following description of an ancient lathe from the correspondence of *Engineering*:

The most uncivilized people are not always the most unhandy, and certainly it is a curious fact that nearly all of the most striking mechanical ideas of the present day have ancestors of a greater or less degree of perfection. I beg to attract your attention to a very curious class of exhibits in the Vienna International Exhibition—I mean the pavilion containing the articles exhibited by the Austrian Ministry of Commerce and Agriculture. Besides many interesting objects, we there find turned objects of wood, such as wooden glasses, bottles, basins, etc., manufactured by the Huculens, the remnants of an old Asiatic nation which had settled at the time of the general migration of nations in the remotest part of Galicia, in the dense forests of the Carpathians. These people manufacture the articles named above, and the instrument they are using for turning them is worth noticing, seeing that it has been employed unaltered since time immemorial. If a Hucule wants to manufacture a turned basin, bottle, etc., he arms himself with a chisel, a hatchet, and a rope, and enters the dense forest which surrounds all human habitations in his part of the country. After having cut the tree out of which he wants to manufacture the desired articles, he looks round for two trees of about one foot or two feet in diameter, and sufficiently close together for his purpose. But it is an essential point in selecting these trees that a young maple or beech should also grow near at hand. Having found this necessary combination for the work to be done, the Hucule makes two holes at a proper height in the two trees, and inserts in these opposite holes maple cones, serving as dead centers. One of these cones is fixed, and the other removable. The wood-bank to be turned is then prepared with the hatchet, so as to be fixed between the centers, and is fitted at one end with a small cylindrical part, to take up the rope for giving a rotary movement to the piece of work. The rope is then taken two or three times round the small cylindrical part, and is attached to the top of the young maple. The lower end of the rope is fastened to a piece of wood, which, at its other end, is attached to one of the roots of the tree, and thus serves as a foot-board. After this the man fastens a cross-bar to the trees, and begins to turn with his chisel whatever he wants to produce.

It is clear that this lathe has a reciprocating motion; but, nevertheless, the objects manufactured with this primitive machine are nicely turned, and do not lead to the supposition of so rough a tool. In conclusion, the writer says: No doubt this mode of constructing lathes is simple, and of no great expense, and the idea may in some occasions prove to be useful, though I do not fear that this newly-discovered form of lathe will beat Mr. Whitworth's out of the field.

THE two machines which best exhibit what the ingenuity of man can do are the watch and the railroad engine. That a machine so small that you may cover it with your fingers in the palm of your hand should be so exquisitely constructed that it reduces the element of time almost to absolute accuracy, in spite of contractions and expansions of cold and heat—so firmly put together that it feels no disturbance of jars in the train, jolts in carriages, nor the endless motions of one's person, riding, running, rowing, jumping—so strong and firm, and yet to be made of parts as fine as a hair and far more supple—must excite admiration in every one who reflects upon the great difficulties to be overcome, and how nearly they are entirely vanquished. There are some who regard the railroad engine as still more wonderful. The perfection to which it is now brought makes it a marvel which no familiarity seems in the least to diminish. The tremendous power which it generates, the capacity of draught, the speed it attains, its perfect docility, the ease with which it does its complicated work, have no parallel among human inventions.—*Nat. Car Builder*.

NAPHTHA AS FUEL FOR LOCOMOTIVES.—The Russian Steamship and Railway Company announce that they have found naphtha, for steam generation in locomotives very advantageous. The material employed by the company is the crude oil from the Caucasian and Volga regions, and compared by weight the amount consumed was about one-half that of coal. The arrangement for burning naphtha is stated to be of such a nature that no difficulty will be experienced in substituting one for coal consumption in place of it, should it be found desirable to do so.

THE Italian army will probably soon be armed with a repeating rifle, as eighty-four of the Vetterli rifles are about to be supplied to each line regiment as an experiment. This weapon is already adopted by the Swiss Government for its troops. It carries the spare cartridges in a long chamber underneath the barrel, and can fire twelve shots in succession without being removed from the shoulder.

It is stated that a mill has been recently started in England in which flour is made by crushing the grain by small trip hammers instead of grinding it.

SCIENTIFIC PROGRESS.

How do Insects Hear?

In a recent paper read by Professor Moyer, before the National Academy of Science, he gave an account illustrated by experiments, of what he supposes to be the organ of hearing in insects. From an abstract of this paper published in the *New York Tribune*, we extract the following:

"Placing a male mosquito under the microscope, and sounding various notes of tuning-forks in the range of a sound given by the female mosquito, the various fibers of the antennae of the male mosquito vibrated sympathetically to these various sounds. The longest fibers vibrated sympathetically to the grave notes, and the short fibers vibrated sympathetically to the higher notes. The fact that the nocturnal insects have highly organized antennae, while the diurnal ones have not; also the fact that the anatomy of these parts of insects shows a highly developed nervous organization, leads to the highly probable inference that Prof. Moyer has here given facts which form the first basis of reasoning in reference to the nature of the auditory apparatus of insects.

"These experiments were also extended in a direction which added new facts to the physiology to the senses. If a sonorous impulse strikes a fiber so that the direction of the impulse is in the direction of the fiber, then the fiber remains stationary. But if the direction of the sound is at right angles to the fiber, the fiber vibrates with its maximum intensity. Thus, when a sound strikes the fibrils of an insect, those on one antenna are vibrated more powerfully than the fibrils on the other, and the insect naturally turns in the direction of that antenna which is most strongly shaken. The fibrils on the other antenna are now shaken with more and more intensity, until, having turned his body so that both antennae vibrate with equal intensity, he has placed the axis of his body in the direction of the sound. Experiments under the microscope show that the mosquito can thus detect to within five degrees the position of the sonorous center. To render accuracy doubly sure, Prof. Moyer having found two fibrils of the antennae of a mosquito which vibrated powerfully to two different notes, measured these fibrils very accurately under the microscope. He then constructed some fibrils out of pine wood, which, though two or three feet long and of the thickness of small picture cord had exactly the same proportion of length to thickness as the fibrils of the antennae of the mosquito. He found that these slender pine rods or fibrils had to each other the same ratio of vibration as the fibrils of the mosquito."

ANILINE COLORS.—Professor Kopp, who has recently made a careful study of the aniline colors at the Vienna Exposition, says that the manufacture of these pigments from coal tar products is making most remarkable progress. Fuchsin, constituted by a salt of rosanilin, is obtained exclusively by the reaction of arsenic acid on commercial aniline. In order to afford an idea of the enormous consumption of this violent poison in the manufacture of fuchsin, it is stated that in Germany alone the same is estimated at 3,300,000 pounds a year. It is only lately that the residues have been treated to regain the arsenic in commercial form. M. Kopp mentions, as a novelty, a beautiful rose-colored coloring matter, called saffronin; which, upon silk, is a very brilliant dye.—*Scientific American*.

EFFECT OF COLD ON IRON AND STEEL.—For many years it has been almost an axiom among civil engineers that great cold tended to produce a brittle condition of iron and steel, and that this hypothesis explained the alleged increase in the breakage of tire-axles, and rails in railroad traffic. According to the recent experiments of Joule and others, however, it would seem that iron and steel, instead of being weakened by freezing weather, are actually capable of resisting greater shocks than at a summer temperature. Dr. Joule refers the greater frequency of railway accidents in winter to the increased hardness of the ground, caused by freezing, by which the iron is subjected to a greater strain or shock than in summer.

NEW USE OF MANGANESE.—The very high price of the metal nickel has led some suggestions that metallic manganese might be employed in its place in the manufacture of German silver. Dr. Percy states that more than twenty years since he manufactured an alloy with manganese which so perfectly resembled German silver that it was sold as such to electroplaters without their detecting any difference.

COLLOIDION FILM.—To produce a collodion film of extraordinary tenacity, which may be desired for certain purposes, Bottger recommends that the collodion cotton be dissolved in a mixture of ether and alcohol in equal volumes, and that a small quantity of balsam of copaiba be added.

CHEMICAL TELEGRAPH.—An improvement has been recently patented in which the paper is wet by the chemical solution by siphon just before reaching electrodes, which are both upon the surface of the paper, the current passing across instead of through it.

The Age of the Earth.

A new mode of finding the age of the earth, attempts to determine approximately the time at which the fiery liquid earth-ball for the first time covered itself with a crust. This is done by means of the difference at the longest and shortest diameter of the earth. According to the calculations of Newton and Huygens this would be 1-578, if the rotation of the earth had always been completed in twenty-four hours, while in fact it amounts to 1-298, which is equivalent to a rotation time of seventeen hours and sixteen minutes, which must once have been the earth's time of rotation. It is, however, probable, for reasons which need not be gone into here, that at the time the earth was covering itself with a firm crust, the time of rotation was also a mean between the original and the present time. That a retardation of the rotation time has taken and is still taking place is now as good as proved, although formerly it was strongly doubted. Of all heavenly bodies it is the moon which astronomers know best, and have most exactly calculated from her movements. Now, the coefficients of the secular acceleration of the moon's course, as found on the one hand from the oldest observations of eclipses, on the other from the theory, are at variance, and there are differences which ought not to exist in the calculations of so well observed a body. Agreement can only be obtained when it is supposed that during the two thousand years which have passed since the Greeks first calculated the eclipses, the rotation of the earth has been retarded 0.01197 seconds. Their exists no difficulty about the causes of this retardation, which is perfectly well explained by the tides. From the cipher thus found, it is easily calculated how much time will be required to cause a retardation of nearly four hours, and the result is that since the firm crust of the earth formed itself, more than two thousand millions of years must have elapsed!—*Exchange*.

DECORATING WOOD BY PRINTING.—Mr. Thos. Whitburn, at a recent meeting of the English Society of Arts, described a process, recently patented by him, adapted to express, on flat surfaces of wood, effects of light figures on a dark ground, or dark figures on a light ground, or of figures light and dark in parts on a ground intermediate in shade. The designs or patterns are engraved in the ordinary way on box-wood, and, from the blocks, the wood is imprinted on a common hand printing press with printer's ink. The process is capable of being used with two or more colors, and is designed for the ornamentation of door panels, furniture, etc.

DETERMINATION OF POTASSA.—The double chloride of platinum and potassium can only be weighed, as such, upon the filter, a uniform desiccation being taken for granted. Such weighings on a counterpoised filter are, if possible, better avoided. The smaller the amount of the double salt of platinum the greater the chance of error. Dr. Mohr proposes, therefore, to heat the salt to fusion with thrice its weight of oxalate of soda in a platinum crucible. After lixiviating the residue with water the chlorine in this solution is determined by means of a decimal solution of silver.

SULPHATE OF MAGNESIA IN DYEING.—Woolen goods, intended to be fulled afterward, when dyed with aniline colors, as dahlia and methylviolet, are found to stand the fulling process better, and generally to resist the action of alkalies, soap, etc., much better, if some sulphate of magnesia has been added to the dye-bath. The reason assigned for this action is the formation of a precipitate of a magnesia compound in contact with alkalies, which precipitate is inert so far as the dye stuff is concerned.

STARTLING.—We are getting ahead entirely too fast. From an item in circulation, we learn that the application of electricity for the reduction of metals from their ores has been patented in England. By regulating the electric current in a proper manner it is claimed that cast iron, wrought iron or steel can be produced directly from the furnace without any intermediate operations. This puddling by means of an electric current will occupy from ten to fifteen minutes only, instead of several hours, as in the ordinary puddling by hand labor or machinery.

AGRICULTURE EXTRAORDINARY.—*Les Mondes* asserts that it is proposed, instead of ploughing or digging the ground, to bore holes, fill them with dynamite, and explode them!

To which we would add that when the potatoes are ready for digging the process need only be repeated.—*Gastlight Journal*.

THE dredge on the *Challenger* has brought up nodules of peroxide of manganese. Mr. Buchanan found that these presented the concentric layers and intimate structure of coral, and is of the opinion that they have been formed by the slow substitution of peroxide of manganese for calcic carbonate in the original coral.

CARBOLIC ACID AND CREASOTE.—Carbolic acid dissolves in ammonia, specific gravity 0.900, forming a clear colorless solution. Commercial carbolic acid gives a blue solution after a time. Creasote, if pure, is insoluble in ammonia. Hence ammonia is the best reagent to detect them in mixture.—*American Chemist*.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's offices, San Francisco:

EDDY MINING CO.—Feb. 5. Location: State of California. Directors—Thomas Bell, J. W. Gashwiler, John Wedderspoon, Joel F. Lightner and S. Heydenfeldt. Capital stock, \$2,000,000.

CHANCE SILVER M. CO.—Feb. 5. Location: White Pine County, Nevada. Directors—Geo. Treat, J. W. Phillips, Richard O'Neil, Henry Schwartz and Edward F. Stone. Capital stock, \$3,750,000.

Company.	Location.	No.	Amt. Levied.	Delinq'nt.	Sale.	Secretary.	Place of Business.

Weekly Stock Review.

THURSDAY, Feb. 12, 1874.

Stocks have been comparatively depressed during the week under review. Nearly all of the Comstocks have showed a decline, and in some instances a serious one. As a rule, the range has not been very great, however. Commencing Thursday last, the market showed a downward tendency, increasing each day, until Wednesday, when the lowest prices since the great rise were met. As usual, there have been no "developments" of importance to account for the change, and people are at a loss for a reason why stocks should drop, apparently without cause.

We do not believe that the change is due to any determined policy of the bears to force down the market; the present State of things is much more simply and easily accounted for by the impression which appears to prevail generally, that stocks, or at least a great many, have been put up too high. When the sovereign people make up their mind to anything, sooner or later the effect is felt. Popular opinion is more influential in the stock market than any tactics of brokers, for the sales are made up mostly of small lots, taken by persons of limited means.

A meeting of stockholders in the Confidence mine will be held on March 9th, to take into consideration and decide upon the question of increasing the capital stock of said Company from \$800,000 to \$2,500,000, to be divided into 25,000 shares of the par value of \$100 per share.

The proposition to increase the capital stock of the Iowa company from \$1,200,000, in 12,000 shares, to \$3,000,000 in 30,000 shares, will be held in this city March 11th.

The following named companies have recently declared dividends; Crown Point, \$3 per share, (No. 40), payable Feb. 12; Belcher, \$5 per share, (No. 23); Keystone Quartz, 50 cts. per share, (No. 10). The Belcher dividend amounts to \$520,000; the total product for

The Mining share market on Monday showed irregular prices. The feature was the decline in Overman, which opened weak at \$100, and fell to \$90, closing at \$92, a decline of \$10 to \$15 from the prices ruling on Saturday. There was an advance of \$1 in the following stocks: Alpha, Crown Point, Consolidated Virginia, Chollar-Potosi, Gould & Curry, Hale & Norcross and Savage. Segregated Belcher declined \$4, Yellow Jacket \$3, Ophir, \$2, Caledonia, California, Belcher, Best & Belcher and Justice each, \$1.

The feature of the market Tuesday was the break in Belcher. The price Monday was apparently strong at \$100 to \$101. The dividend of \$5 per share was paid and the price receded from \$89 to \$85, closing at \$86.50. Crown Point was also \$5 lower, closing at \$90, and will be apt to run still lower after the dividend. The amount of business transacted was about the same as yesterday. Overman continue to decline, selling at \$87.50, or \$5 lower than the lowest price yesterday. Segregated Belcher also fell off \$12, Yellow Jacket \$3, Sierra Nevada \$2.50 Consolidated Virginia, Hale & Norcross and Kentuck each \$2, Alpha, Chollar-Potosi, Gould & Curry, Julia and Ophir each \$1. Savage rose to \$114 to \$116, a gain of \$3.

On Wednesday, still lower prices were reached by the Comstocks. Other Nevada mines, with those of Idaho and California, looked up a little. Raymond and Ely has stood the break well, considering that it is a "ruined mine;" but persistent effort will doubtless force it down still further. Belmont has recovered a little, showing that the first intelligence in regard to the absence of the supposed ore-body, was overdone.

MONO MINES.—A friend of ours, writing from Benton, Mono county, states that times are very dull up there at present, and that C. H. Daron's mill, which runs by water power, has shut down on account of frost. Mack & Powning's mill, running by steam power, keeps

GLOBE CONSOLIDATED M. CO.—Located on the Arizona, Utah and Globe lodes. Capital stock, \$3,800,000, in 38,000 shares. **Trustees**—M. D. Townsend, E. L. Tracy, W. DeWitt, Thomas Cole and G. W. Fisher.

INTERNATIONAL WOOD PAVING CO.—Capital stock, \$100,000. **Object:** To carry on the business of manufacturing and laying wooden pavements, also selling rights to lay the same under letters patent issued by E. W. Perrin. **Directors**—Charles E. Allen, George T. Bromley, H. T. Wheeler, E. W. Perrin and W. H. Forbee. Capital stock, \$1,000,000, in 10,000 shares of \$100 each.

ELECTION—BOWERY CONS. M. CO.—**Trustees**—J. W. Spear, W. E. Hall, Henry Mcears, D. M. Love, W. Easton.

HEAVY BLAST.—On the 10th inst., the first blast in the Enterprise claim at Sucker Flat was fired. Two hundred and thirty-one kegs of Western powder were exploded, which was a success beyond all expectations. They have recently completed a bed-rock tunnel 2,530 feet long, which took three and a half years, both day and night, to complete. Their flame is 1,000 feet long and four feet wide, the whole of which is lined with rocks.

MINTS AND ASSAY OFFICES.—A Washington special says that the Committee on Coinage, Weights and Measures, have agreed to hear Messrs. Wells, of Missonri, and Logan, of Illinois, and the Directors of Mints, on the propositions to establish mints or assay offices at Chicago and St. Louis. It is probable that the committee will decide to report against the mints, but in favor of the assay office at each of these cities.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

M. & N. W. Co.—*Miner*, Feb. 7: The company's mill has again been making a short run, with satisfactory results. We learn that Dr. Fish, the Superintendent, has gone to Carson, and the bullion will be coined and sent to the home office in Milwaukee.

THE Silver Glance shaft is going down at the rate of $5\frac{1}{2}$ ft. per week—the last measurement giving a depth of 27 ft. below the 100-ft. level. The rock in the bottom of the shaft carries rich sulphurete in quartz.

AMADOR COUNTY.
CANAL.—*Independent*, Feb. 7: Work on the Amador canal has progressed favorably, con-

Considering the inclement weather which has interfered materially with the progress of the work; still the canal will be completed very nearly as soon as we at first calculated upon.

BUTTE COUNTY. *Record*, Feb. 7: We have reports that big diggings have been struck in

The bluffs below the Lava Beds, and just beyond what is known as the Kent pond or Lake Como. The pay dirt is at the depth of some 14 ft. only, and lies under a deposit of lava. The whole bluff, it is said, has already been located, from the river to the Oroville railroad, a distance of 4 or 5 miles. There is said to be no mistake about the richness of the deposit, and it is believed to be as extensive as the bluff itself.

CALAVERAS COUNTY.
SAN BRUNO.—*Chronicle*, Feb. 7: The lower tunnel has been run 30 ft. since the pay chnte

was tapped, the rock showing rich throughout. The ledge will average over 2 ft. thick the entire distance. As yet, there is nothing to indicate that the tunnel is approaching the termination of the chimney. There are about 30 tons of quartz in the dump.

GENUINE FLINT.—We learn that 60 tons of flint, taken from the celebrated Wallace and Ferguson mine, in the Sheep Ranch district, yielded \$11,000. Subsequent crushings have paid from \$70 to \$80 per ton.

EL DORADO COUNTY. 7. 7.
 ROSE.—*Republican*, Feb. 5: About 60 tons of
 rock that will go \$60 to the ton has been taken
 from the "Rose" ledge since the first crushing

from the base ledge since the first crueeling, and workmen have now commenced going down upon the ledge, about 70 ft. from the mouth of the tunnel.

Testing It.—There is now being crushed at

The old "Shepard Mill" some 45 or 50 tons of rock taken from the Ida Mitchell. They have discontinued work in the shaft for the present, and are now running across the ledge. The coming out looks well.

S. D. Hill has his pipe playing on the henk of Badger Hill, just east of town; and Jo. English has a stream tearing into "Pigeon Hole," just above Judge Davidson's.

MINING.—The miners at Scales Diggings are hard at work piping, having plenty of water.

KERN COUNTY.

MINING.—*Miner*, Feb. 7: The first

work on the Havilah tunnel was commenced last Tuesday. The mouth of the tunnel is about 100 yards from town. It is anticipated to strike the Sovereign lead when in 1,700 ft.

at a distance of 1,000 ft. beneath the croppings, and to penetrate the main mineral belt at 3,000 ft. The Sovereign lead is a continuation of the renowned Big Blue ledge, which has been located for several miles. The tunnel will strike several leads which will pay large dividends.

The Grizzly mining company will put up a forty-stamp mill this spring. This mineral belt has paying quartz enough in sight to keep an army of miners employed for a hundred years.

MINERS are at work on the bottom of the Joe Walker mine, and will commence to take out rock soon.

MARIPOSA COUNTY.

LUMP OF GOLD.—*Gazette*, Feb. 6: Indian Gulch comes to the front with the highest thug, in the shape of a chunk of gold, which has been heard from this winter. The story is that a German last week picked up a nugget weighing eighteen pounds, avoirdupois. The man who reports the extravagant "find," lives in Hornitos.

MONTEREY COUNTY.

THE TRES PIÑOS COAL MINES.—Hollister Enterprise, Feb. 7: A committee of San José gentlemen, appointed by the Katherina Coal company, to visit and examine its coal mines on the Tres Piños, about 15 miles from Hollister, comprising John B. Price, Julian Pomeroy, A. C. Farno, B. J. Rhodes and John A. Ethell, stopped in town last night, on their return from the inspection of the property. Their report is highly favorable.

NAPA COUNTY.

PINE FLAT ITEMS.—*Cor. Register*, Feb. 7: We are having a new excitement nearly every day, new prospectors arriving in large numbers. The mountains are being thoroughly searched and many new mines discovered.

On Friday last, a very rich lode was found about half a mile northeast of the Sonoma mine. 4,500 ft. were located at once, and the claims consolidated into one company, which is called the "Anna Belcher Consolidated Quicksilver Company."

Work was commenced on the "Great Central" mine, which is on the same lode as the Sonoma mine, 1,500 ft. east of it, almost in the center of Pine Flat. The "Central" shows very fine ore in the outcrop of the ledge, and promises to be a rich mine.

Yesterday I paid a visit to the famous "Bloodhound Mine," situated 2½ miles northeast from Pine Flat. There is a most wonderful display of rich ore in the ledge on the surface. There is a natural arch large enough for a man to walk through that appears to be nearly half cinnabar.

VALUABLE ORE.—Our correspondent "Bret" brought us down the other day a specimen of cinnabar from the Missouri mine of a very high grade; we judge of at least 45 to 50 per cent. A few tons of such ore would be a small fortune; if the Missouri can yield much ore of this quality, its value is immense.

NEVADA COUNTY.

EMPIRE.—*Union*, Feb. 7: In the eighth level, running toward the south, in the Rush and Layton ground, a ledge was struck yesterday, which is fully 2 ft. thick and showing well in free gold and sulphurets. This ledge has about 600 ft. of backs above the 8th level. The same ledge will be found in the north drift, as the miners say.

DARTMOUTH.—The Dartmouth mine will hang up its batteries to-night, for a short time. The reason for so doing is that in blasting out gravel in the "sulphur bar" last week, they broke into the old Alta drain tunnel, letting water in large quantities, and interfering so much with the working of the mine, that Capt. Miller concluded to put on three eight-hour shifts and finish the main tunnel to connect with the Alta drain tunnel, some distance ahead of the present workings. This will give complete drainage to the whole mine. There is no lack of good pay gravel.

Transcript, Feb. 6: James Hill & Co., at Lowell Hill, have struck good pay gravel in their mine. This company opened up about one year ago, working day and night, except Sundays. They were compelled to wash away immense amounts of earth and gravel before they struck pay dirt. Since then they have had one clean up which paid them handsomely. As they progress their gravel grows richer and the prospects brighter.

THE SWAMP ANOEL CO., at Lowell Hill, have nearly completed their immense tunnel. When completed, this will be one of the best tunnels ever constructed in this mining section. The rock channel in this mine is 30 ft. in depth, and had to be blasted out a long distance, at an immense cost. Water is plenty on Lowell Hill, and everybody is now at work.

PLACER COUNTY.

BELLEVUE MINE.—*Herald*, Feb. 7: Work has been commenced by the Bellevue Co. on the Buckeye mine in earnest. The water has been pumped out of the shafts, and it is found that on the 242 ft. level, 30 ft. east of the shaft, in face of drift, the ledge is 20 inches thick, and pays \$40 per ton. Of this rock they have 100 ft. solid backs to the 140 ft. level. It is the intention of the Superintendent to drive to connect with shaft No. 2, 160 ft. distant. It has been proved from actual workings that this chute of rich ore is 260 ft. long, extending west from shaft. It is the intention of the company to put the very best machinery for hoisting and pumping on this mine, which the Superintendent is to go below to-day to procure, and as soon as this machinery is up, they will commence sinking deeper. This property, though as yet in embryo, bids fair to be a first-class mine, and not second to any mine in the State.

The property of the company consists of 5 parallel ledges, known and proved to carry remunerative ore.

THE CRATER.—This Ismons mine, we learn, is turning out its usual quota of rich ore, and bids fair to equal if not surpass the expectations of shareholders. The mill after a short run was to be cleaned up yesterday, and it was known from the amalgam in sight, that a handsome dividend will be proposed by the Trustees. This company is out of debt, with shining prospects for the future.

COAL MINE.—The side track is now about completed to the coal mine at Lincoln; repairs of the shaft from the cave, which occurred some time ago, are all made good, and everything is in readiness to commence work with a large force.

PLUMAS COUNTY.

MIMMO NOTES.—*National*, Jan. 31: The Indian Valley mine and mill are in full blast, and the quartz is paying well. The Baker mine is also turning out some rich rock, and the mill is running steadily. A new strike of rich rock has been made in the Genesee mine, and it is said to be looking and paying better than ever before.

BIO WAGES.—We are informed that the New York Co., at Sawpit, have been taking out some splendid pay dirt, with prospects of plenty more ahead. They make an average of ten dollars per day to the hand.

SONOMA COUNTY.

COAL.—*Democrat*, Feb. 7: James S. Todd, of Vallejo Township, has discovered a coal vein on his farm, which lies on the Sonoma mountain. A wash in the bed of Copeland creek through the soil to the depth of 8 feet, exposed the coal stratum, from 1 to 1½ inches thick, imbedded in shale. Ira Davis, whose farm adjoins that of Mr. Todd, is also prospecting for coal. He has run a cut of 50 feet into the east face of the mountain. In the cut there is a ledge of shale through which run streaks of coal. From this point Mr. Davis will run a tunnel on the ledge.

TRINITY COUNTY.

EASY WORK.—*Journal*, Feb. 7: The ground is so thoroughly soaked this season, that our miners have no difficulty whatever in caving the banks. The only complaint we have heard thus far is that most of them can get down more dirt than their flumes can carry. Water being plenty the claims run to the utmost capacity. Another year and we expect to see five and six ft. flumes in our mines instead of two and three feet ones.

BIO CAVE.—Bartel Jacobs, of Red Hill, informs us that, on last Saturday night, the band of this mining claim caved off to such an extent as to nearly fill the claim. The "Little Giant," standing about 150 ft. from the back, was struck by the cave and carried about 75 ft. down the hill. Five or six lengths of pipe were smashed, but as there was extra pipe on the ground and the Giant was not injured beyond repair, work was delayed but a few days.

JUNCTION CITY.—From J. M. Pickett we learn that mining prospects in that vicinity were never better than now. Water plentiful and everybody working with success. The Keno Hill claim had a big cave, or slide, which it will take all spring to sluice off.

MINERSVILLE.—Supervisor Bates tells us that this favored portion of Trinity is flourishing. Everybody has water and all are doing it. Big clean-ups will be in order shortly.

TUOLUMNE COUNTY.

RICH ORE.—*Democrat*, Feb. 7: On Monday Thomas Whitto brought to town 169 ounces of retorted gold, the product of 40 tons of ore crushed at the Spring Gulch mine the previous five days. This winter a new chute was opened in the northern part of the mine and this is the first crushing from it. The ore was taken from the center of the chute, which if correctly represented cannot help proving of great value. The mine since opened by the present owners has not failed to pay well at such times as water was to be had for crushing purposes.

PATTERSON MINE.—*Independent*, Feb. 7: The main shaft is now down a distance of 130 ft., intersecting tunnel No. 1, at a depth of 63 ft. 60 ft. below that another level is being driven ahead night and day, and is now in 40 ft., with about 10 feet to go to strike a large chute of very rich ore which is known to be there. The main shaft is still going down, and another level will be started. Recently powerful hoisting works have been erected. Further north, is tunnel No. 2, which is in 400 ft.; and here another shaft is sunk, and is now down a depth of 50 ft. below the tunnel. From thence a level is being run toward the main shaft, and is now in 100 ft., having at 20 ft. from the entrance passed through the apex of a chute of exceedingly rich ore, being a continuation of a vein in tunnel No. 1, the rock being thickly interspersed with free gold. But it was passed over until another large and rich vein further ahead was reached. This level is still being pushed onward, the last 25 ft. being in first class rock, which shows free gold abundantly.

This shaft and level is immediately beneath the old Patterson works, which in former years paid so handsomely. Mr. Hughes, the superintendent, has mainly devoted the last three or four months to the work of properly developing the mine, to ascertain, as near as possible, the size and value of its numerous chutes and veins, the erection of substantial and permanent hoisting works, and works for concentrating sulphurets, which abound in the rock and prove to be exceedingly rich; the mill is hammering away day and night, always rendering a good account of itself.

Nevada.

WASHOE DISTRICT.

CROWN POINT.—*Gold Hill News*, Feb. 7: Daily yield, 450 tons of ore, from the 1,000, 1,200, and 1,300-foot levels. The ore breasts on the 1,400-foot level improve in appearance as they are worked eastwardly. The north winze, which was started at the east wall from the 1,400-foot crosscut, has been sunk to a vertical depth of about 18 feet. The entire bottom of the winze is in very rich ore, which constantly improves in quality as the work of sinking the winze progresses. The direction of this drift is about ten degrees south of east, so that practically it may be regarded as a crosscut. The ore encountered in the main drift at the 1,500-foot level assays well.

OPIMA.—The winze from the south drift, on the 1,300-foot level, is making favorable progress, the bottom still in ore of increased richness. The west crosscut from the south drift, which is 80 feet north of the south crosscut on the same level, is also in 64 feet, the quality of the ore gradually increasing in value as the work progresses. The up-raise from the 1,465-foot level, to connect with the south winze from the 1,300-foot level, is also in good ore. The winze on this level shows considerable improvement, and it is expected will undoubtedly strike the west ore body in ten or twelve days' time, when some rich developments may be looked for.

SIERRA NEVADA.—Sinking the new shaft is making rapid progress, the rock in the bottom blasting finely. The shaft is now down 140 feet.

MINT.—Sinking the shaft, which is now down 150 feet, has been suspended for the purpose of erecting more powerful hoisting machinery. The ground for the new building is being rapidly graded, and the engine and other hoisting machinery has been purchased in San Francisco and will arrive by rail in a few days more.

OCCIDENTAL.—The main west drift is carried forward without serious interruption. The progress is somewhat impeded by the influx of water from the face. The closeness of the air considerably retards work. During the last 24 hours the water in the old shaft has receded four feet. When the wall of the ore vein is penetrated, a great rush of water is anticipated.

CHOLLAR-POTOSI.—There has been no ore extracted during the past week, on account of the dumps being full, and it being almost impossible for teams to haul the ore to the mills. The body of ore developed in the south drift at the fifth station, while it still holds out strong promise for the future, has not proven as extensive and valuable as was at first supposed.

SEORATON ROCK ISLAND.—The drift north from the main tunnel, at the east wall of the ledge, is being energetically driven ahead.

JUSTICE.—The incline connection with the shaft is now completed, and open to 400-foot level. Sinking below that point is commenced, to carry the incline down to the 500-foot level.

BELOHER.—Daily yield, 550 tons of ore, from the 1,000, 1,200 and 1,300-foot levels. The main incline is down 87 feet below the 1,400-foot level. The north drift from the 1,400-foot station is in 70 feet, in hard rock. The south winze on the 1,300-foot level is down 100 feet. All of the ore breasts and stopee throughout the mine are looking and yielding splendidly. The total yield of the mine for January was over \$1,000,000. The lower levels look better and better as further developed, and the prospects of the Belcher mine at the present time are about as flattering as reasonable stockholders need ask.

SUTRO.—The work of sinking the winze is being prosecuted vigorously. The ledge continues to widen out as the sinking progresses. Streaks of lively looking quartz are encountered all along, with favorable indications of striking a valuable ore body at no distant day.

GOLD & CUREY.—There is no definite change to report in any of the prospecting drifts of this mine. No high grade ore has yet been encountered on the 1,700-ft. level.

LEO.—The main tunnel is being pushed forward into the hill, following the ore vein at a good rate of daily progress. The vein continues to average about 3½ feet in width, and improves in appearance as further developed.

OVERMAN.—The main west drift at the 1,200-ft. level is making satisfactory progress, the face continuing in hard rock, but it blasts well. The winze being sunk from the 1,000 to the 1,200-ft. level is down 200 ft., following the dip of the ore vein, and the bottom is still in rich ore. The new compressed air engine and accompanying drilling machinery and fixtures will be put in as soon as possible, materially expediting the running of the west drift at the 1,200-ft. level.

CONSOLIDATED VIRGINIA.—The mine is looking very well on the different levels. The south drift on the 1,300 ft. level is progressing favorably. From the stopes above the 1,200-ft. level sufficient ore is extracted to supply the mill on the line of the railroad. The mills at a distance from the railroad are idle, as ore cannot be transported over the road in their present condition.

ROCK ISLAND.—Drifting south from the main tunnel still continues with good progress. The crosscut from the north end of the drift north from main tunnel is in the ledge and a winze has been started therein. The prospects for finding a body of pay ore at this point are very favorable. Ground was yesterday broken for the erection of hoisting works, preparatory to sinking a shaft.

CROWN POINT EXTENSION.—It is expected that the new hoisting works to operate this mine

will be completed within the next two weeks, ready for sinking again in the shaft.

EUENPA.—The main west drift has now passed through 80 ft. of ledgematter and no sign of the west wall as yet. The assays during the week have varied from \$8 to \$50 to the ton.

ALPHA.—The north drift on the 1,500 ft. level is still making steady progress, following the line of the ledge.

ANNES.—Now engaged erecting machinery over the old shaft. It is the intention to prospect the vein from the bottom of this shaft, and at the same time continue the exploration in the main tunnel.

HALE & NORCROSS.—Sinking the main incline is progressing at the usual steady rate, the rock at the present depth being very hard. The prospecting drifts on the 1,900 ft. level are being driven ahead with vigor.

NEW YORK CONSOLIDATED.—Over half of the bottom of the shaft is now in fine looking quartz, some of which gives low assays in silver. It is in stringers or feeders, but might concentrate into a solid body of quartz. Good progress is made in sinking.

SOUTH COMSTOCK.—New shaft down 25 ft. Good progress is made in sinking, and during the last three or four days considerable quartz has been met with.

GLOBE CONSOLIDATED.—Under the above name the Arizons, Utah and Globe companies have consolidated to work their lodes together to better advantage, working through the Arizona and Utah shaft. The raise from the 1,400-ft. level to connect with the old Globe workings is up 170 ft. The main west drift at the 1,400 is still in hard blasting ground.

DAXTON.—The new pump to draw water from the third station is completed, and a new boiler added to the steam capacity of the works. Owing to the continual bad state of the roads a comparatively small amount of ore is daily extracted, and no additional mills are required to crush it.

CALIFORNIA.—The north drift from the 1,300-ft. level of the Consolidated Virginia shaft, to prospect this mine, is now in 143 ft., and good progress is being made, although the drift is necessarily rather hot, from lack of copious ventilation. It will be continued through to a connection with the 1,300-ft. level of the Ophir, when plenty of ventilation will be secured.

JULIA.—Both southwest drifts at the 900 and 1,000-ft. levels are being driven ahead, following the ledge. Cross cuts are being made at the 1,000-ft. level, a short distance apart, which show the ore body to be extensive. The assays for the week have varied from \$30 to \$70 to the ton.

SILVER HILL.—The Hope mill is still steadily running on ore from the second level, north drift. The fine body of ore developed by the south drift at this level, improves in both quality and extent as further worked.

TYLER.—Work has been resumed in the face of the main west drift, which is now in the ledge, the quartz looking very favorable with some spots of ore of fine quality. The main east drift at the 200-ft. level is being rapidly cleaned out and repaired.

SAVAGE.—There is little or no change to note for the week. Driving the main southwest drift, at the 1,900-ft. station, is making slow progress.

BULLION.—The main north drift on the 1,700-ft. level, is still pushed vigorously ahead, the rock in the face working finely.

YELLOW JACKET.—The main incline is down 90 ft. below the 1,500-ft. level. The work of prospecting the 1,400 and 1,500-ft. levels is being prosecuted vigorously as usual.

DARRANELL.—We hear it rumored that this company will shortly resume work upon their mine, with a view to developing the good body of ore which the Overman developments assure it to contain.

KNICKERBOCKER.—The new hoisting works will start up to-morrow, when work will be resumed in the mine.

SENATON.—The bottom of the shaft continues in favorable looking porphyry, with streaks of low grade ore.

JACOB LITTLE.—The fine ore development in the lower tunnel has shown improvement during the week, the whole face of the tunnel continuing in ore.

NEVADA.—The main south drift still continues in the ore body, which is looking finely. The same may be said of the raise above the tunnel.

LADY WASHINGTON.—Sinking the main shaft deeper is making first-rate progress, the ground working well and no water interfering.

INDEPENDENT AND OMOEA.—Sinking the new shaft and repairing and clearing out the old tunnel is making excellent progress.

DANEY.—The new shaft is now down 340 ft. and progressing well, no water yet interfering.

FAIRMOUNT.—The northwest drift from the main west tunnel is in 57 ft., and still shows good ore in its face.

SUCOR.—The new shaft, east of the hill, is now down 340 feet. The little shaft progresses faster and is now down 37 feet.

WOODVILLE.—The Ramsdell mill is kept running steadily on ore from this mine, and there is plenty on the dump.

CALERONTA.—The main tunnel is progressing rapidly, being worked from both ends—from the shaft and from the outlet.

KOSSUTH.—The face of the main west drift, 200-foot level, continues in fine ore which shows more extensively as the drift progresses.

IMPERIAL.—The main drift on the 1,300-foot level is making steady progress, with strong indications of soon reaching the west wall of ledge.

EMPIRE.—The main east drift on the 1,900-foot level is being steadily driven ahead.

Agassiz's Death.

Dr. Morrill Wyman, of Cambridge, has concluded his work on the autopsy of Professor Agassiz, and makes the following report:

This autopsy made in the interests of science, is in accordance with the wishes of the great naturalist, expressed several years ago.

Cambridge, December 13, 1873.—Autopsy by Drs. R. H. Fitz and J. J. Putnam; present, Drs. J. B. S. Jackson, J. Wyman, C. Ellis, M. Wyman, S. G. Webster.

Frame large. Fat tissue abundant. Cranium, brachycephalic, falling off abruptly from the middle of the sagittal suture. Greatest antero-posterior diameter, 197 mill. met.; greatest lateral diameter, 163 mill. met.; these measurements made before the removal of the skin. Depth of frontal bone, measured externally at the median line, $5\frac{1}{2}$ inches = 135 m. m.; length of sagittal suture, 5 inches = 128 m. m. The walls of the skull were thick and heavy; the dura mater exceedingly adherent to the bone and remarkably thick. The pia mater moderately transparent. Along the arachnoid veins were white lines indicating chronic thickening; the veins themselves rather more injected than usual. The cerebral sulci were deep and wide. On each side of the median line, near the anterior ascending convolution on the left, and the posterior ascending convolution on the right, was a depression which might have held a prune stone, or a little more. The brain tissue around was diminished without evidence of disease. The arteries at the base of the brain showed evidences of extensive chronic disease of their lining membrane, with narrowing of the caliber of the carotids. The basilar artery was apparently a continuation of the left vertebral alone, the right vertebral being represented by an exceedingly small vessel which united the basilar with the inferior cerebellar, the latter being merely the prolongation of the exceedingly small right vertebral. The left vertebral was larger than usual, larger even than the basilar. In these unusually arranged arteries were very important changes.

Commencing at an inch below the anterior edge of the Pons Varolii and extending downward, the walls of the left vertebral artery were stiff, in part calcified, and its lining loose. At half an inch from the point just mentioned, immediately over the left olivary body, was a reddish-yellow opaque, friable plug (thrombus) completely obstructing the vessel; still lower was another more recent, but probably ante-mortem, plug. The first was one quarter of an inch long, and the second four inches long. A third plug, an inch long, was above the first and touching it. Opposite the middle of this point there was arteriosclerotic degeneration of the basilar artery. The walls of the carotids were also in part calcified. The posterior part of the right cerebellar lobe (the side on which the vertebral artery was exceedingly small) was softer than usual, the corresponding foliations swollen and indistinctly defined, indicating disease of this part, probably consequences of the changes in the arteries.

The weight of the entire brain was 54.4 avoirdupois ounces, or 1,495 grammes; allowing a diminution in the weight of the brain from the age of 35 to 40 years, at the rate of one ounce avoirdupois for each ten years elapsed, the greatest weight of the brain may be estimated at 56.5 avoirdupois ounces.

Weight of right anterior lobe (separated with the fissure of Rolando for a guide), 234 grammes; weight of left anterior lobe, 233 grammes. Heart large, muscular fiber firm and of good color. The attached portion of the aortic valve rigid; the mitral opening large. In the left ventricle at the lower third a firm organized clot of the size of a peach stone attached to the wall at the anterior portion near the septum; around this clot a more recent one had formed, its center softened and granular. From this, probably, some small portions had been carried by the blood to the arteries in the base of the brain, doing their part in obstructing them and causing the fatal changes above described. The lining membrane of the heart, where the clot was attached, was much thickened, and the muscular layer at the same part very thin, near the apex not visible to the naked eye.

The lungs were adherent to the ribs on both sides of the chest, the evidence of old inflammation. The other organs were healthy.—*Corr. N. Y. Tribune.*

McGARAHAN AGAIN.—Wm. McGarahan is considering the proposition of introducing a bill to instruct the Secretary of the Interior to restore to the records pertaining to the grant covering the New Idria quicksilver mine, giving it to the right owners. The patent was signed by President Lincoln, and afterward defaced with the certificate that it had not been legally issued. McGarahan is here ready to take any action that may be necessary. His case is now pending in the Supreme Court of California.

STILL ANOTHER TUNNEL.—It is proposed to excavate a tunnel 4,000 feet long, through King's Mountain, Kentucky, for railroad purposes.

A California Lily.

In our engraving we present another of our beautiful native wild flowers, for which California is so famous. The technical name of the plant is *Lilium Bloomerianum* var. *ocellatum*, Kellogg. It was illustrated and described in the proceedings of the California Academy of Sciences for the year 1873, by Dr. A. Kellogg.

There are two varieties of *L. Bloomerianum* found growing together in the interior; one with bold, distinct and well defined dark dots and spots, with longer sepals more attenuated above; the other with ocellate or nipple-like blotches, being broader and of more continuously oblong form. The same distinction into masculine and feminine forms is observed among these maritime lilies. The Island lily has slightly scabrous stems, and more discolored-scabrous under surface to the leaves, and are always scabrous along the mid-rib beneath; whereas the Sierra Mountain lilies are mostly glabrous—sometimes pubescent on both mid-rib and nerves, but never scabrous; they also sport more leaves in the whorls, etc.; these also are broader, hence the greater num-

CALIFORNIA LILY.

ber of nerves; the numerous flowers are usually (if not always) alternately distributed on longer and more divaricate peduncles. The slightly purplish scales of those of the mountains become very remarkably purple on the islands. The enormous gregarious hulk, with its numerous stems, is a peculiar feature not observed in the thousands of specimens hitherto examined.

Found by Mr. W. G. W. Harford, of U. S. Coast Survey, on Santa Rosa Island, growing on the west side of deep sheltered ravines, trending nearly north and south, hence, only where they get the morning sun; but are shaded from the ardent meridian, or post-meridian heat, which burns the leaves and kills them on opposite exposures of the same locality. They are found growing in loose gravelly detritus of sweet, freshly made soils, on the high and dry well-drained or leaching benches, or steeper declivities; where thus sheltered they thrive the best, mid fogs and fierce cold winds.

The seeds of this lily can be procured of Miller & Sievers, florists, 27 Post Street, S. F., by those desiring them.

An English domestic gas-making apparatus consists of an iron retort fixed over an ordinary kitchen range, so that gas is distilled during the usual processes of cooking. The coke may be used to support the fire. The gas passes through a condenser to a petroleum chamber, thence through four perforated floors covered alternately with layers of lime and sawdust, and finally to a reservoir of the usual construction.

Mining Syndicates.

A syndicate may be loosely described as a "limited company for bringing out joint-stock schemes." There are very many promising mining properties not in a position to be brought before the public, owing to a multiplicity of causes. Here a syndicate steps in, purchases up all the varied interests, it may be, lays out some money on the property itself, and then places the undertaking as a going concern, before the public. It is obvious this is a perfectly legitimate, and with due caution, a comparatively safe operation, as much so as a man who purchases wood and nails, and makes a box. We quote the following from a contemporary:

"One of the most remarkable commercial features of the day is the formation of 'Syndicates,' the name of which gives little information to the uninitiated as to the nature of the operations conducted. Our friend Johnson only gives the word in the verb form, but a somewhat older dictionary-maker, Bailey, has 'syndick,' 'a person deputed to act for any corporation or community,' and this appears to be the origin of the word now so familiar in

Sargent's Amended Mineral Land Bill.

Sargent's Mineral Land Bill has been greatly modified, on the suggestion of the proper office at Washington. The breeze which it excited in the Legislature, we think, had more to do in bringing about the change than the official suggestion, for it is not the habit of Senators to how meekly to departmental advice. It must be painfully apparent to Mr. Sargent, by this time, that he can introduce no measure which will not be subjected to the closest scrutiny by his constituents. As a consequence, there is no alternative for him but to out loose from them altogether or submit to their wishes. The modification of the bill in question can be regarded in no other light but that of a confession of original error. The bill, whether so intended or not, in its first form, would have enabled the railroad to acquire the title of vast bodies of land in California and Nevada, which might turn out rich in all kinds of minerals.

The bill, as it now reads, applies practically only to lands in California and to possible placer mines and gravel deposits there. If it should become a law, it will be possible to acquire claims like these to the extent of 160 acres at a time. That is to say, if no placer mines or gravel deposits are apparent at the time of entry, absolute title to this amount of land can be secured. We do not think that this is a good bill or a wise measure. It is an entire reversal of that system of mining rights which has heretofore prevailed, and which we inherit from a country which has had more experience in mining than ours. If there be good farming land in what is known as the mineral belt, which cannot now be taken up because of the general reservation for mining purposes, a contingent pre-emption might be permitted—a pre-emption subject to the right of discovery and entry on this part of miners, upon paying for the actual damage done.

The government of Spain never relinquished its right to mineral deposits wherever found. It did not work the mines itself, or take out the ore; but it charged a royalty upon the proceeds. There can be no doubt that the minerals likewise belong to our Government, but it never has asserted its right or charged a royalty. It has left the pursuit perfectly free and open to all who might choose to engage in it, contenting itself with the benefits resulting from the general prosperity. This Mr. Sargent now proposes to reverse. The effect of this bill will be to allow the interposition of private ownership between the Government and its right to the minerals. The change is altogether too violent and radical. It would be the reverse of the practice, not in Spain, but in England, and other civilized countries. We do not believe that any thoughtful Statesman would ever propose legislation so entirely at variance with precedent and custom, unless the evils of this old system had become so glaring as to amount to a demonstration of its wrongfulness. Nothing of this kind has occurred in the case under consideration. We have little more argument on the side of this proposed change, than that Mr. Sargent wishes it. It must be admitted that this is neither very cogent, nor very convincing reasoning. Certainly, it will be considered very weak besides that other fact of a possible reaction in favor of California mines and mining.

Of that reaction, those who are experienced in matters of this kind, profess already to see the signs. Perhaps the rush Nevada-wards was too sudden, and partook more of the character of adventure than of a sound, scientific, and good business operation. Our own mining capacities had not been fully tested.

Ignorance of the principles of scientific mining presided over most of the ventures which had been made. The return wave, if it ever sets in, in ever such small volume, will bring back much experience, a varied and important knowledge of mining, in many branches, and skill in prospecting and developing. If ever anything like this should take place, how would it operate to have all the mineral belt taken up in 160-acre lots? We believe schemes like these have heretofore been common in California. There are noses for speculation so sharp as to sniff a monopoly years ahead. We think, therefore, that it is much better that mineral matters should be allowed to remain as they are. There is no evil that has been developed by the existing system which can not be remedied by far less radical legislation than Mr. Sargent proposes.—*Bulletin.*

UTILIZATION OF SLAG.—A marked feature in many of the Swedish smelting districts is that the outer furnace walls are built of slag. This utilization of the waste cinder is practiced throughout the country by running the slag into brick-shaped moulds directly from the furnace hearth; and they are then used in the external walls of the calcining arrangements and the cooler portions of the other masonry.

In his work on orchids, Mr. Darwin says: "There must be moths with proboscis capable of extension to a length of between ten and twelve inches, because there are certain of these plants with nectaries at least eleven inches deep."

financial circles. The term is now applied to a body formed for the purpose of occupying a middle position between persons who are the owners of property or interest and the general public. An active agent discovers a good property that may be greatly improved if more capital can be employed in it; he makes a conditional contract for its purchase by a certain time and a certain price, and then sets to work to 'syndicate' a company, fixing the capital required for the purchase at perhaps two, or even three times as much as he has undertaken to give, the difference being the reward of his enterprise. Collieries, mines, and shipping are among the objects as yet specially favored by the syndicating process. It is obvious, that by such an operation valuable property may be brought into the market."

We understand that several gentlemen of eminence and experience in mining are about to form themselves into a syndicate. It is not our place here to go into details, but we are warranted in saying that the names of the parties appear to be influential, and of a character to insure success; representing, as they do, varied mining interests—coal, iron, lead, copper, and slate. The year opens with much brighter prospects for home mining enterprise than many of its predecessors; the difficulties in the labor market appear to be clearing away, and we trust we have seen the last of the disastrous strikes, unfortunately but too frequent of late; and with money at a low and steady rate, there is every reason to suppose that the year 1874 will prove a prosperous one for home mining.—*London Mining Journal.*

USEFUL INFORMATION.

Transparent Paper.

A German invention, recently patented, and which may be useful to draughtsmen and others, has for its object the rendering more or less transparent of paper used for writing or drawing, either with ink, pencil or crayon, and also gives the paper such a surface that such writing or drawing may be completely removed by washing without in any way injuring the paper. The object of making the paper translucent is, that when used in schools, the scholar can trace the copy and thus become proficient in the formation of letters and outlines without the instruction usually necessary; and it may be used in any place where tracings may be required, as by laying the paper over the object to be copied it can be plainly seen. Writing paper is employed by preference, its preparation consisting in first saturating it with benzine, and then immediately coating the paper with a suitable rapidly drying varnish, before the benzine can evaporate. The application of varnish is by preference made by plunging the paper in a vat of it, but it may be applied with either a brush or sponge. The varnish is prepared of the following ingredients: Boiled bleached linseed oil, 20 pounds; lead shavings, 1 pound; oxide of zinc, 5 pounds; Venetian turpentine, $\frac{1}{2}$ pound; mix and boil eight hours. After cooling, strain and add white gum copal, 5 pounds, and gum sandarac, $\frac{1}{4}$ pound. Thus prepared, the paper will be found to possess all the requisites for use, as stated above.—*Exchange and Review.*

THE REFINING OF COTTON SEED OIL.—Dr. Dotch communicates to the *Scientific American* the following method and proportions for refining cotton seed oil: 100 gallons of the crude oil are placed in a tank, and 3 gallons of caustic potash lye, of 45° Baume, are gradually added and well stirred for several hours; or the same quantity of oil is treated with about 6 gallons of soda lye of 25° or 30° Baume, and heated for an hour or more to about 200 or 240° Fahr. under perpetual stirring, and left to settle. The clear yellow oil is then separated from the brown soap stock, and this dark soap sediment is placed into bags, where the remainder of the oil will drain off; and the sediment has a marketable value of 3 or 4 cents a pound for soap makers. The potash lye has to be made in iron pots, but the oil and lye may be mixed in wooden tanks.

A DURABLE PASTE.—Four parts by weight of glue are allowed to soften in 15 parts of cold water for some hours, and then moderately heated till the solution becomes quite clear. Sixty-five parts of boiling water are now added with stirring. In another vessel 30 parts of starch paste are stirred up with 20 parts of cold water, so that a thin milky fluid is obtained without lumps. Into this the boiling glue solution is poured, with constant stirring, and the whole is kept at the boiling temperature. After cooling to drops of carbolic acid are added to the paste. This paste is of extraordinary adhesive power, and may be used for leather, paper, or cardboard with great success. It must be preserved in closed bottles to prevent evaporation of the water, and will, in this way, keep good for years.—*Druggist's Circular.*

ELECTRIC SEA LIGHTS.—Frank Leslie has in his establishment an electric apparatus for electrotyping and photographing. On a dark, slightly foggy night last summer he put the apparatus on the roof of his building, and the light given was strong enough to show shipping in the harbor two miles away, and to enable citizens a third of a mile away to read newspapers as easily as by daylight. Electric lights should be carried at the mastsheads of all steamers, and would cost scarcely \$25 per night. The apparatus requires for its working an engine of seven-horse power, but it could be readily attached to the engine of the vessel. A French electrician has recently invented an apparatus that is said to give a light nearly four times as intense as that furnished by Mr. Leslie's machine.

TESTING BREAD FOR ALUM.—Harsley says: Take a wineglassful of water, place it in a porcelain dish, add a teaspoonful of tincture of Campeachy wood (prepared by digesting two drachms of freshly cut wood in five ounces of alcohol) and the same quantity of a concentrated solution of carbonate of ammonia in water. Dip into the pink-colored solution a piece of bread to be tested for alum, withdraw it after five minutes, and lay it on a plate to dry. If in one or two hours the bread becomes of a blue color, it contains alum; if it contains no alum, the red color will entirely disappear.

UTILISING PETROLEUM.—In Canada a burner is in use by which residuum of crude petroleum is used instead of wood or coal in brick kilns. By a simple contrivance, says the *Oil Journal*, the nozzle of the burner is made to throw the flame directly downward at the first firing, and after burning the head, as it is termed, this nozzle is replaced by a straight one, the change being effected in a few moments. The flame is thereby thrown into the arch any required distance, burning the whole kiln from one end, and doing it in much less time than by the old method.

MICE.—An exchange says these pretty little pests may be driven away by scattering camphor gum in their haunts.

VEGETABLE GLUE.—Gum arabic solutions are frequently employed instead of glue and mucilage, but are objectionable on two accounts. First, they render the unsized paper transparent, and if a piece of common printing paper is attached to any dark or printed surface the color shines through, and besides it does not attach it firmly to other paper. Neither can paper be attached to wood or pasteboard. Paper pasted on metallic surfaces with gum arabic usually separates from it in a short time. As a cement for glass, porcelain and earthenware it is utterly useless. We are informed on good authority that all these disadvantages are overcome by simply adding an aqueous solution of sulphate of aluminum, two grammes of the crystallized sulphate of aluminum being sufficient for 250 grammes of concentrated gum solution prepared from two parts gum to five of water. The salt named dissolves in ten times its quantity of water, and is added directly to the gum solution. A solution of alum does not answer as well as the simple sulphate of alumina, which can be prepared from alum by precipitating the alumina with ammonia, washing thoroughly on a filter and dissolving in sulphuric acid. The vegetable glue thus prepared will not, of course, ferment, sour or mould, which will be appreciated by those using it.—*Ex.*

EXPERIMENTS by Galletly show how dangerous it is to allow greasy refuse to lie, even in small quantities, in warm places. He found that such waste, dipped in boiled linseed oil, and wrung out, required, at a temperature of 170°, only 105 minutes at the most to take fire, and that the bulk need not be very great, as a match-boxful, at 167°, took fire in one hour. With raw linseed oil it required four or five hours; with rape oil, at 170°, over six hours; with castor oil, at 185°, over a day; with olive oil, 1½ hours; and with sperm oil it would not take fire at all. The heavy coal and petroleum oils were found so retard oxidation by excluding the air. Silk waste did not take fire, but gunpowder placed in it was fired in an hour; and in cotton, under similar circumstances, only after 1½ hours.

CEMENT FOR IRON.—A correspondent of the *English Mechanic* says that he has used the following recipe with the greatest success for the cementing of iron railing-tops, iron gratings to stoves, etc., and with such effect as to resist the blows of the sledgehammer: take equal parts of sulphur and white lead with about a sixth of borax; incorporate them so as to form one homogeneous mass. When going to apply it, wet it with strong sulphuric acid and place a thin layer of it between the two pieces of iron, which should then be pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the iron will have the appearance of having been welded together.

PREPARATION OF FLOOR WAX.—Two ounces of pearlsh, 10 ounces of wax, and about half a pint of water are heated to boiling in a dish, which is frequently agitated, until a thick fluid mass is formed, from which, upon removal from the fire, no watery liquid separates out. Boiling water is now cautiously added to the mass, until no watery drops are distinguishable. The dish is again set on the fire, but its contents are not allowed to boil, otherwise myricin would separate out, 8 or 9 pints of water being added, little by little, with constant stirring. Coloring matter may be added if desired.—*Nessler.*

CHAMOTTE FLOUR.—This is pulverized chamotte stone, found in the kaolin or porcelain earth near Halle, Germany, and its equivalent in many other localities. Chemical analysis proves that it is a silicate of alumina, colored with some oxide of iron. It contains 85 per cent. silica, 11 to 12 alumina, and 2 to 3 of iron. It is of course therefore very fire-proof, and may probably be replaced by many other ingredients possessing similar virtues, such as pulverized asbestos, soapstone, etc.—*Manufacturer and Builder.*

PRESERVATION OF MUSHROOMS.—Dr. Remsch, in *Les Mondes*, proposes to cover the fungus with a film of collodion and place it in an airy position. He states that the contraction of the mushroom is equal in every way, and that the chemical and anatomical constitution remains the same. An exact form, preservative against insects and germs, and the keeping of the substance for future experiment, are the advantages obtained.

RENDERING MOULDS CONDUCTORS.—In order to render moulds of plaster or gutta-percha, used in electrotyping, conductors, the use of a solution of 1 gramme silver nitrate, 2 grammes water, 2½ grammes ammonia (sp gr 0.96), and 3 grammes absolute alcohol is recommended; before the coat is quite dry, it is exposed to a current of sulphuretted hydrogen.

SPILLER recommends a mixture of pulverized iron borings, kaolin, and syrupy silicate of soda as a lute for fixing on the heads of stills which are required to stand a high temperature. We should judge the same might be found useful in other situations, such as the joints of cast-iron furnaces, for instance.

It is reported that hemp, when the blossoms are just opened, is an infallible preservative of textile fabrics against the attacks of moths. The stalk, with leaves and flowers, is cut when blooming (about July), and dried in the shade. It is said to preserve its properties for several years.

A pure white vinegar can be made, it is said, from the juice of watermelons.

GOOD HEALTH.

Experiments on Gastric Digestion.

Experiments on dogs with gastric fistula, consisting in introducing given quantities of albumen enveloped in muslin into the stomach, confirm Schiff's previous statements that the energy of gastric digestion is in a high degree dependent on the physiological state of the animal as to hunger, or exhaustion of the stomach by just completed digestion. In regard to the latter, he found that the stomach was able to digest only a very small quantity of albumen, as compared with a stomach in a normal state of digestion. The difference could only be in the condition of the pepsin. Schiff has made a number of experiments to determine the digestive power of the stomachs in different conditions. He finds that the digestive power does not depend on the mere quantity of pepsin, but to a great extent on the relative quantity of water and acid in the artificial infusion. The ordinary quantity of water employed to make an infusion of the mucous membrane of the stomach is inadequate to bring out its full digestive power.

Various experiments are recorded, having for their object to determine the maximum degree of dilution. The research is not yet complete, but a remarkable result has been arrived at, viz., that the stomach of a dog in good condition requires 200 centilitres of water to bring out its full digestive powers. Such an infusion has been found to be capable of digesting 60,000 grammes of albumen.

Schiff's former researches with infusions of stomach led him to state that an infusion of one stomach might, under very favorable conditions, digest from 150 to 180 grammes of albumen—an amount which was considered by several physiologists as too high. The present results, therefore, are the more likely to draw attention.—*Druggist's Circular.*

ARSENIC IN HYDROPHOBIA.—In a late number of the *Correspondenz-Blatt* Dr. Guisan gives a number of cases showing the value of arsenic as a prophylactic in hydrophobia, and even as a remedy also after symptoms are marked. He relates that a rabid dog, between the 7th and 9th of June, hit thirteen persons in various towns of the canton of Fribourg. All were recommended to be treated with one-twentieth of a grain of arsenic morning and evening, as a prophylactic measure. Eight submitted to this prophylactic measure, and none were affected. Four declined, or were not allowed to take the arsenic. Of those four, two remained unaffected, and two died. One began the arsenic treatment, but speedily left it off; she was attacked, but at a much later period, and died. Dr. Guisan recommends not only the internal employment of the arsenic, but that the wound should be dressed with it.

SLEEP NECESSARY.—"A man who would be a good worker," says Henry Ward Beecher, "must be a good sleeper. The quality of mental activity depends upon the quality of sleep. Men need on an average eight hours of sleep a day. A lymphatic man is sluggish, moves and sleeps slowly. But a nervous man acts quickly in everything. He does more in an hour than a sluggish man in two hours, and so in his sleep. Every man must sleep according to his temperament—but eight hours is the average. Whoever by work, pleasure, or sorrow, or by any other cause, is regularly diminishing his sleep, is destroying his life. A man may hold out for a time, but the crash will come, and he will die. There is a great deal of intemperance besides that of tobacco, opium or brandy. Men are dissipated who overtax their system all day, and undersleep every night."

CAMPFOREIN.—During the recent cholera epidemic in Vienna, a new remedy called *campforein* was used with great success in the hospitals. It is prepared simply by passing chlorine gas into pure turpentine oil until saturated; it gives a thick, heavy oily fluid of brown color, with a strong smell of chlorine. It must be freed from muriatic acid, which may be done by washing with water. The remedy is applied by placing a portion in a flat vessel and holding it to the patient to inhale. This indicates that oil of turpentine is the best absorbent of chlorine gas, and therefore can be employed with advantage in operations and other cases where chlorine is evaporated in large quantities.

A GOOD PLAN.—R. Hampson proposes that physicians in prescribing unusual doses, that is, in excess of the maximum adult dose of the Pharmacopoeia, or exceeding those commonly administered, should affix to their prescriptions some sign by which the person dispensing the medicine will understand the formula to be intentional, and be relieved from much anxiety. In many instances much delay and perplexity would thus be obviated. Under the existing system a feeling of oppressive personal responsibility obtains in the mind of every careful druggist, when called upon to prepare ordinarily dangerous prescriptions.

As the result of more than thirty experiments on the feeding of animals on meat taken from tuberculous creatures, M. Collet concludes that such flesh does not develop tubercles in healthy animals. Where other experimenters have obtained opposite results, he believes that they have experimented on animals already diseased, or have allowed portions of tuberculous matter to gain admission to the lungs of the animals in the air they breathed.

Replantation of Teeth.

Dr. J. O. Smith writes to the *Dental Cosmos* that a recent article in that periodical leads him to state that in his practice replantation of teeth has nearly ceased to be an experiment: Within the last three years I have successfully performed the operation on five teeth (two for one patient). In each case the tooth was badly decayed, and the root ulcerated. After extracting and treating the tooth socket, I treated the root, and filled not only the cavity but the nerve-canal in the root, and replaced the tooth, and without an exception each operation has been a perfect success.

The first patient whose tooth I treated in this way was a young man with whom I was very intimate; he had an ulcer, which gave him much trouble, on the superior incisor. It had been filled several times with different materials without satisfactory results, and he was obliged to have it extracted, and as an experiment I offered to undertake the operation of replacing it, after removing the ulcer and properly filling the tooth. The operation consumed about seventy minutes. There was much sensitiveness about the tooth at first, which soon subsided, and about a year afterward he had the other superior incisor treated in the same manner.

It is now over two years since the last operation, and to use his own words, "They are the best teeth I have." Since then I have performed the operation on three different patients, and every case has proved a perfect success.

WHO SAYS WE ARE DEGENERATING?—A few years ago, at the Eglinton tournament in England, it appeared that the famous knights of three and four centuries ago must have been smaller even than the Englishmen of to-day, for it was impossible to put on their armor. And now come vital statistics to prove that we are more hardy and longer-lived than our fathers. The statistics kept at Geneva since 1560 show that the average term of life has been steadily lengthening. At that time the average was only 22 years; it is now 40. In the fourteenth century the average mortality in Paris was 1 in 16; the rate has been reduced in our day to 1 in 32. In England, less than two centuries ago, the mortality was 1 in 33; now 1 in 42. The laws of life are better understood; the comforts of life more widely distributed, and habits of living improved; even consumption, the fatal malady of our New England climate, is yielding slowly to a wiser method of treatment, and the annual percentage of deaths is smaller than fifty years ago. If, by sound system of diet or exercise, the constitutions of New England girls could take on a higher vitality and vigor, the outlook for the future would be hopeful.—*Ex.*

INSECTS IN MEDICINE.—Insects had a prominent place in the *materia medica* of former days, and were administered with as much confidence in their efficacy as is now given to the medicinal plants of the garden or the tinctures of the apothecary. They were generally given in the form of pills. Five gnats were equal to three grains of calomel. A lady-bird was a sovereign remedy for colic and measles, and a cockchafer for hydrophobia, and the plague. Ants were considered to be invaluable against leprosy, and of great efficacy in strengthening the memory and giving wonderful vigor to the frame. An Italian professor declared that the finger imbued with the juice of a little insect having the pretty name of *rhinobatus antidontalgicus*, will retain the power of curing the toothache for a year!—*Four. of Chemistry.*

SUCCEDANEUM FOR SKIN-GRAFTING.—Under the heading of "Skin-Grafting Superseded," the *Medical Press and Circular*, referring to Dr. Fiddes's statement that no skin need be taken, but merely a few epidermic scales, editorially suggests a professional trial of a popular method of healing old ulcers by means of the "skin of a new-laid egg." The egg must be fresh laid; and the membrane, which is easily detached from the inner surface of the shell, is to be smoothly spread over the ulcer. Our contemporary has lately heard of a case in which this method "was completely successful after years of ordinary treatment had failed." It is not stated whether the cicatricial tissue manifests any tendency to grow feathers in such cases.—*Cincinnati Lancet and Observer.*

BONE FELON.—Of all painful things, can there be any so excruciatingly painful as a bone felon? We know of none that flesh is heir to. As this malady is quite frequent, and the subject of much earnest consideration, we give the last recipe for its cure, which is given by that high authority, the *London Lancet*: As soon as the disease is felt, put directly over the spot a fly-blistar, about the size of your thumb nail, and let it remain for six hours, at the expiration of which time, directly under the surface of the blister, may be seen the felon, which can instantly be taken out with the point of a needle or a lancet.

ONE CURE OF DYSPEPSIA.—If you do not want to become dyspeptic, you must avoid the habit of gormandizing outside of regular meals. Give the stomach an occasional rest, and it will stand out the longer under the repeated pressure of huge meals and indigestible confections. All the stomach needs is occasional rest. Hearty meals and incessant lunches furnish ample cause to account for most cases of dyspepsia.—*Manufacturer and Builder.*

BROMIDE of calcium, in doses of from 15 to 30 grains, is recommended by Dr. Hammond as an excellent hypnotic. It must be kept in the dry state, as the solution decomposes quickly.

MINING SCIENTIFIC PRESS

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Morris' Settler and Amalgamator; Locomotive Bell Ringers; How Mark Twain Got "Beat," 97. A California Lily, 102. Economical Mine Management and Its Results; New Loan to the Sutro Tunnel; Sargent's Mineral Land Bill, 104. A Future Rival to California; "Flea Seeds," The Victoria Spring Bed, 105. Legislation About Mining Stocks; That Quicksilver Bill; Patents and Inventions, 108.

ILLUSTRATIONS.—Morris' Settler and Amalgamator, 97. California Lily, 102. "Flea Seed," Victoria Spring Bed, 105.

MECHANICAL PROGRESS.—The Wield Gun; New Agricultural Implement; An Ancient Lath; Partha as Fuel for Locomotives, 99.

SCIENTIFIC PROGRESS.—How do Insects Hear? Aniline Colors; Effect of Gold on Iron and Steel; New Use of Manganese; Collodion Film; Chemical Telegraph; The Age of the Earth; Decorating Wood by Printing; Determination of Potassa; Sulphate of Magnesia in Dyeing; Startling Agriculture Extraneous; Carbolic Acid and Cresote, 99.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 100.

MINING SUMMARY from various counties in California and Nevada, 100-101.

USEFUL INFORMATION.—Transparent Paper; The Reboiling of Cotton Seed Oil; A Durable Paper; Electric Sea Lights; Testing Bread for Alum; Utilizing Petroleum; Vegetable Glue; Cement for Iron; Preparation of Floor Wax; Chamotte Flour; Preservation of Mushrooms; Rendering Moulds Conductors, 103.

GOOD HEALTH.—Experiments on Gastric Digestion; Arsenic in Hydrophobia; Sleep Necessary; Camphorine; A Good Plan; Replantation of Teeth; How Says we Degenerating? Insects in Medicine; Succedaneum for Skin-Grafting; Bone Felon; One Cure of Dyspepsia, 103.

MISCELLANEOUS.—Bullion Product of Nevada; Quartz Mines of Sierra County; The Plume Business; Shipbuilding on the Clyde; California Mines; Iron Manufacture in the Colonies; Yuba County Copper Mines; Klamath River Deposits; The Nevada Ice Company's Works; Montana Quartz Mines; In Luck, 98. Agassiz's Death; McGarran Again; Mining Syndicates; Sargent's Amended Mineral Land Bill; Utilization of Slag, 102. The Sticken River Country; Fort Worth; Silver Mines; Utilization of Mineral Waste Products; Resources of Utah; How Sargent's Bill will Work; Analysis of Soft Soaps, 106. Cornucopia Mines; Accidents in Coal Mines; Marine Schools; The St. Louis Mine Patent, 107.

That Quicksilver Bill.

We are glad to see that the Press of the State takes the same view of the bill to regulate the price of quicksilver, as that taken by us in our last issue. A good many of our exchanges consider the whole thing a burlesque, while it is at the same time universally condemned. The proposition is an absurd one, and totally impracticable. The only way out of it is for some of our big mining men to take their money out of stocks and invest some of it in cinnabar. The mountains of the Coast Range abound in cinnabar ores, and a large number of claims are partially opened, and only want the aid of capital to develop them. If these mines are opened and worked, the product will increase, and the price naturally fall.

Another way, as the *Bulletin* suggests, as to abolish the tariff on quicksilver, which at present prices amounts to not less than fifteen cents on every pound consumed by the miners on this coast. We notice that most of our exchanges pitch into the "monopoly," which, by the way, has not been in existence since last April. The New Idria and New Almaden product fell off last year considerably. The Redington increased its product, but all of them combined, with the numerous newly-discovered mines did not produce within two thousand flasks as much as was produced in 1873. All the small mines came into the market with their quicksilver, and as they could undersell the monopoly price, it was useless to keep up the combination. Moreover, the natural laws of supply and demand raised the price above even the heavy figures formerly charged by the monopoly. The troubles in Spain have retarded progress at the Almaden mine, the principal producing mine out of California.

With the decrease of production the consumption has increased in our mining States and Territories alone, fully 50 per cent. Any one can easily see that it would not need any monopoly under these circumstances to raise the price of quicksilver. It raised itself and the only way to lower it is to open and work more mines. We do not think it at all probable that the Bill introduced in the Assembly

regulating the price of quicksilver in California at 35 cents per pound will ever become a law. In the first place it would be absurd and would be a bad precedent for fixing the prices of other products. Again, it would operate in such a manner as to shut down the mines now running, prevent others from being opened and would shut down half the mills and mines in the country. We need cheap quicksilver, but must take a better method to procure it than the Bill proposes.

Economical Mine Management and Its Results.

We desire to call the attention of miners to an example which merits their attention, showing the good results from the economical and practical management of mining property. It shows at the same time that large companies with many officers cannot do as well with mines as a few owners can who devote their personal attention to their business.

The Gold Hill mine, owned by David Coughanour and Thomas Moultrie, is on Granite creek, three miles from Placerville, Idaho. They have a 25-stamp mill, 5 of Hungerford's concentrators, 4 Wheeler pans and 2 settlers. The mill runs night and day, Sundays and all, and during the past three years the total stoppage of the mill has not exceeded 10 days. The miners do not work on Sundays, but have plenty of ore out for the mill to crush. The mill is situated in a ravine and a tunnel has been run in on the ledge both ways, so that the quartz never sees daylight until after it has been crushed. The tunnel running each way from the ravine is right in on the ledge and is 3,000 feet long. The ore has been stoped out to the surface, as the ledge is well defined the whole length. The deepest place where the surface is 300 feet. The quartz vein is very soft and the walls hard, so that they seldom have to do any blasting, which of course is a great saving. They crush from 35 to 40 tons of ore per day, and the total cost of mining, milling and all is only \$4 per ton.

This gold mining property was formerly owned by several other parties, all of whom made a failure of working, and abandoned it. The mill itself originally cost, at the time of high freights, \$120,000. At that time Mr. David Coughanour, an old miner, but a ship carpenter by trade, was wharf sawing in the neighborhood. He and Mr. Moultrie, when the mine was abandoned by the former owners, succeeded in buying the whole property, mostly "on time," for \$25,000. At the time he got the mine he was down to bed-rock; but by untiring perseverance he has developed a splendid mine, and made it pay handsomely at the same time.

They have at work now on the property about fifty men, whom they pay sixty dollars in currency per month, and board, during the winter; and, in the spring, when there is water for the placer mines, they pay seventy-five dollars in currency per month and board. Wood is bought and stacked up for four dollars per cord in greenbacks; and they have plenty of water for steam purposes, etc. In the coming spring, the owners intend to sink on their ledge where it crosses the gulch, and where they will have breasts both ways. The boiler they now have has sufficient capacity for the new engine, hoisting works, etc. The ledge has been worked continuously the length of the tunnel—three thousand feet—and they have not come to the end of the pay rock. They have now on hand nearly five thousand tons of sulphurets concentrated, which they intend to work up at some future time. They have never worked any sulphurets, and they have accordingly accumulated at the mill.

Mr. David Coughanour, the principal owner, is the manager of the property. He works as hard as any of the laborers, and could not be distinguished from them in dress and appearance at the mine. He is much liked by all who know him, and is a plain, practical man. Mr. William Coughanour, his nephew, formerly a school teacher, looks out for the finances and superintends the mill. He is handy with tools, has rigged up a lathe, etc., and turns off the old tappets, makes repairs, and is a handy man for such a place. Mr. Moultrie, formerly, we believe, a drayman, is an invalid and resides in this city, visiting the mine occasionally.

Any one who visits this mine, will say that it is the best managed one he ever saw. Everything goes like clockwork and in a systematic manner. It is worked on economical business principles, as a mine should be worked. They buy their provisions, supplies, etc., in this city in the summer when freight is low, and pay cash for everything they get. Their success shows what industry and perseverance, combined with good common sense, will do. They have merely brought into the business of mining the same methods pursued in ordinary business, which few people do. True, their mine is favorably located, but others failed in the same place. We don't believe there is another mill in the country that has not stopped more than ten days in three years. They clean up five stamps at a time and keep the rest running. There are plenty of other mines in this State, and others on the Pacific slope, that would pay to work as well as the "Gold Hill," if they were managed as well. We wish we could record more instances of the same kind.

New Loan to the Sutro Tunnel.

The Sutro tunnel was in, at last reports, 5,555 feet, and the work was progressing as well as usual. We notice the publication of a prospectus of the company in London, in which Messrs. McCalmont Bros. & Co. are authorized by the Sutro Tunnel Co. to receive subscriptions for £600,000 sterling, or \$3,000,000 in gold, 8 per cent. first mortgage convertible bonds of that company. The bankers who have charge of this business, are the same who so successfully managed the London loans of the Reading R. R. Co. The bonds will be of \$1,000 or £200, each bearing interest from the 1st of April, 1874, at 8 per cent. per annum, payable half-yearly on the 1st of April and 1st of October in each year. The principal will be redeemable at par in 29 years by an accumulative sinking fund of 1 per cent. per annum, applicable by yearly drawings, to be made in London under the superintendence of the Trustees, the first drawing to be made in London, October 1st, 1874, the company having the power to increase the sinking fund if it shall see fit.

The principal and interest of the bonds are to be payable at the holder's option, in London, at the office of Messrs. McCalmont & Co., in sterling; or in New York, at the office of Messrs. J. & W. Seligman & Co., or in San Francisco, at the Anglo-Californian Bank (Limited), in gold; free in all cases of all Federal, State, or Municipal taxes in the United States. As a valuable privilege, holders of bonds will be entitled at any time before the expiration of six calendar months after the opening for traffic of the main tunnel from its mouth to the Comstock lode, with a double track railroad, shall have taken place, and shall have been officially and publicly announced by the company, to convert the bonds now offered into shares of the company of an equivalent nominal amount at par—that is to say, 100 shares of \$10 each, fully paid up for each bond of \$1,000 or £200 sterling—upon depositing the bonds with the coupons not due at either of the places appointed for payment, with a notice addressed to the company of the desire to effect the exchange. The bonds will be issued, bearing interest from 1st April, 1874, at the price of 82 per cent., payable by instalments as follows: 5 per cent. on application; 15 per cent. on allotment; 15 per cent. on 2d March, 1874; 15 per cent. on 1st June, 1874; 32 per cent. on 15th September, 1874. Parties desiring to anticipate payments, may do so on allotment, or on either of the above dates, under discount at the rate of 5 per cent. per annum.

The distinctive features of this undertaking are well known on this coast. The company is entitled, by Act of Congress, to a royalty upon the produce of all the mines benefited by the tunnel. It will also possess the traffic from a whole mining district, in which there are already more than a hundred miles of underground workings, so that it will not be dependent on the success of any particular mines. In order to provide ample funds for the completion of the tunnel and railway, and a margin in addition for the construction of mills, reduction, and other works of a magnitude commensurate with the future of the enterprise, a first mortgage has been made of the tunnel, railway, water rights, franchises and lands to Mr. Robt. McCalmont, of Philpot-lane, and Mr. Isaac Seligman, of Angel-court, Throgmorton street, London, as trustees, to cover a total nominal sum of £1,600,000 or \$8,000,000 bonds.

It is believed that the proceeds of the present issue will be sufficient to open the tunnel and railway to the Comstock lode, although it is anticipated that at a later date, in order to obtain the full benefit of mineral lodes as developed, further issues may be made to erect reduction works, and make other extensions and improvements of the company's property. But in any case no further issue of bonds will be made by the company before 1876, and then only at a higher price than the present issue, except by consent of the trustees of the mortgage. The net minimum revenue accruing to the company under the laws of Congress from royalties, transportation, etc., and based on the present production of the mines, is estimated at £370,000 per annum, being more than twice the sum required to provide for the interest and sinking fund upon the entire mortgage of £1,600,000, should that amount ever be issued. This revenue is entirely irrespective of much larger profits expected from mining developments, and concentration and reduction works.

The chief office of the company is in this city. The Board of Directors is composed of the following gentlemen, four of whom are nominees of the trustees of the mortgage:—Mr. Joseph Aron, Mr. Charles W. Brush, Mr. John B. Felton, Mr. S. Heydenfeldt, Mr. Edward N. Hooper, and Mr. Thomas C. Wedderspoon, of Messrs. Cross and Co.; and Mr. Ignatz Steinhart, of the Anglo-Californian Bank (Limited). The legal advisers of the company in London are Messrs. Freshfields, 5 Bank Buildings, Lothbury, E. C. The authorized share capital of the company is \$20,000,000, of which \$16,000,000 have been issued, and the proceeds expended in the acquisition of the franchises and lands, in bringing together the necessary machinery and plant, and towards the construction of the tunnel and railway, and in the provision of a sum which has been lodged with Messrs. McCalmont Brothers & Co., sufficient to provide for the interest and sinking fund of the present issue for three years from the 1st of April, 1874, before which period it is expected that the works themselves will be productive.

Sargent's Mineral Land Bill.

Considerable discussion has been provoked by Sargent's Mineral Land Bill, and a good many people have mixed up that introduced by him with one introduced by Mr. Ward, of Illinois. Senator Sargent on the 11th inst., presented in the Senate the resolution of the California Legislature, instructing Senators and Representatives in Congress to oppose the bill introduced by Mr. Ward. After reading the resolution he said:

"The reason I desire to call the attention of the Senate to this resolution is to say that by some blunder of the press or telegraph the bill which was introduced by Mr. Ward, and to which I am opposed, believing it to be injudicious, believing that it would be subversive of the mining interest of the mining States and Territories, was credited to me. It was telegraphed to the people of the Pacific Coast that I introduced this bill, and for which I was freely criticised and denounced as being the author of the bill in which my long knowledge of mining matters would seem to implicate me. In order to set this matter right, I would say that I have not introduced any such bill, and I am not in favor of it. I am not in favor of compelling miners to apply for patents for their claims, except at their own discretion, under the existing laws. I would say that the criticism which has been made on me in consequence of the erroneous position I have been placed in, is unjust to me. The surreptitious and anonymous communications sent to me I do not see fit to characterize as they deserve. I move that the resolution be printed and referred to the Committee on Mines." The motion was agreed to.

Both Page and Luttrell appeared before the House Committee on mines and mining on the same day, while they were considering the Sargent and Page Mineral Land Bill. The Mineral Land Bill providing for the protection of settlers and miners in the mineral district of California, and for a uniform price of \$1.25 per acre, was taken up and finally discussed. Luttrell said he approved of the bill. It was a necessary measure in order to secure a good population in the mining districts where farming and mining go hand in hand. He thought the provision to exclude railroad companies from deriving any additional benefits was not strong enough, and therefore he asked that the following amendment be added at the close of the first section to read as follows:

And provided that nothing herein contained shall be so construed as in any case to enlarge or modify any grant heretofore made to any railroad company or corporation, or to allow any such railroad companies to take, in satisfaction of any such grants, any placer mining land.

Page said:—I accept the amendment proposed by my colleague, although the Committee are aware that the whole object of his amendment is secured by the first provision already in the bill; but I am willing, however, to grant him this, so his constituents may be certain that he is not acting in the interest of the railroad company.

General Negley, who has some constituents in Pennsylvania, who own mines in California, and who have written to him on the subject, said he fully accepted the bill with one proviso, which he offered and it was accepted. It is as follows:

"Provided, That none of the provisions of this bill shall be construed to apply to, or affect in any manner, any land to which there is an adverse claim, or any land title which is now in controversy or being litigated in a State or Federal Court, or any of the Departments of the Government."

The Committee then agreed to report the bill with the amendments proposed, which was done as soon as Congress opened, and the bill was ordered re-committed and printed. It is thought that the bill will now pass when the Committee report.

AN OVERWORKED BOILER.—A good lesson is taught in the verdict of the coroner's jury in the case of D. M. Folsom, who was killed last week, by the explosion of a boiler at the corner of Stevenson and 7th streets. The verdict was as follows: That the deceased came to his death from injuries received from the collapse of a boiler furnace, and that said collapse was by over-pressure of steam. That through ignorance and a want of proper inspection laws, the boiler had been frequently worked to four times the pressure which should be allowed as a factor of safety, thereby injuring and decreasing its original strength, so that it was liable to collapse with less than the pressure at which it was tested when manufactured. Signed: W. W. Hanscom, Albert Whipple, George W. Dickie, F. J. Curry, W. Hawkins, M. Greenberg, James Aitken, J. W. Farren.

MINT STATISTICS.—The annual assay of reserved coins from the Mints at Philadelphia, San Francisco and Carson, began on the 11th at the Mint in Philadelphia. The pieces for assay amount in all to \$50,000 in value, and it will require a session of at least three days. The total coinage of the three Mints during the present fiscal year was as follows: Philadelphia—pieces, 30,142,930; value, \$20,786,228. San Francisco—pieces, 1,851,300; value, \$17,061,500. Carson—pieces, 529,440; value, \$841,455. Total for all Mints—pieces, \$32,523,670; value, \$38,689,186.

A Future Rival to California.

The auriferous gravel deposits of California, though practically inexhaustible, and covering an immense tract of country, require so much capital to work, that poor men can do little with them. The old surface placers which panned out such immense sums to individual miners are long since worked out, and it is only occasionally that we hear now of claims of this character. All old miners, however, have a fondness for shallow placers, very naturally too, so whenever any new mines of this kind are struck, there forthwith commences an exodus from other localities to the favored one. The Stickeen River mines are most looked to just at present and big stories are told of the country where the mines are situated, but its remoteness, hard climate, short season and other disadvantages deter many from going who otherwise would do so. Notwithstanding these drawbacks, however, quite a number of men are preparing to visit the country in the spring. Gravel miners possess, also, a charm to the capitalist, who of late has found out that he has a surer return in that class of mining property than in any other. For this reason a number of hydraulic mines have of late been disposed of to our English cousins.

The hydraulic mines of California have obtained a world-wide reputation, and nowhere else are they of such extent and richness. During the past year, however, we have heard whispers of magnificent tracts of auriferous gravel, situated in the United States of Colombia. The mineral resources of this country are entirely undeveloped and although it has always been known that extensive mines existed there, the presence of auriferous gravel was not suspected. The country contains silver, gold, platinum, copper, lead, iron, mercury and antimony, and some precious stones. With the exception of the salt mines at Zipaquira, little mining of any account has been done. Until within the past year or two, little has been done with the gravel, the existence of which was not, in fact, known until lately. Now, three or four companies are prospecting and working, and others are about to engage in the business.

We had a conversation this week with Mr. Thomas H. Follingsby, who returned from the country referred to recently, and also with Mr. Morales, the Colombian Consul in this city, and learned some facts from them which may be interesting to our readers. Mr. Follingsby, who is an old California '49er, has been down there some three years and has prospected the country pretty thoroughly. He says that the belt of auriferous gravel covers the country from Maricao on the Atlantic side to Barbacoas on the Pacific. This mining country is perhaps 1,200 miles long. The hills are pretty steep generally, and there is an abundance of water. The formation is precisely like the Californian gravel country, with the same red hills, sharp gravel and quartz, etc. In some places these hills of gravel run continuously for a hundred miles, and the belt is some sixteen miles wide. As far as he could ascertain, the gravel is from 100 to 200 feet deep. He himself discovered wet diggings in the State of Santander, to which place he is about to return with a complete hydraulic mining outfit of pipe, nozzles, etc. In this locality he says he was able to get about half a cent to the pan from surface dirt over a large extent of country. The diggings were full of boniders, just as they are in California. There is not much iron in the country. There is no very tough cement, but all the gravel he came across was free, and easy to wash.

Mr. Follingsby has also been in French Guiana, where the mines are rich, but the climate very bad, indeed, and very unhealthy. He says that although on the seaboard in Colombia it is sometimes unhealthy, when you get into the back country, at an elevation, the climate is salubrious, and as healthy as it is here. The mines can be worked all the year round, as there is great abundance of water in most localities.

A few companies are now working in the gravel mines referred to. One company was formed in this city and a man sent down to test the mines last year. The mines were on private property, and the owner came here and made a contract with certain parties in this city. Three hydraulic chiefs were taken down and a few experienced hydraulic miners went with the party. After they got running, they are reported to have averaged two pounds of gold per day with one nozzle and a head of water with 200 feet fall. At all events the manager returned here and went back again last month with 10 hydraulic chiefs, 8 for his company and 2 for other parties. They also took a lot of pipe, bolts, rivets and machinery with them. They already had three chiefs with them though they used only one in testing the ground. This company is working in the State of Cauca, in Barbacoas county on the Pacific side.

The consul also informs us that he has sent down three hydraulic chiefs and accompany-

ing machinery and pipe, for a company formed in New York, who sent here for their apparatus. The mine worked by this company are in the State of Tolima, on the west side of the Magdalena river, on the Atlantic side. This company was called the Cordillera Mining Co. of New York, and they are now at work, having started in last summer.

Another New York company started work in the State of Tolima in 1872, and are now doing very well. They, however, are working some old quartz mines.

Another company organized by two Californians, Col. Baker and Mr. Wilson, who fitted out in New York, are now at work on a bar on the river Saldana in Coydima in the State of Tolima. They have a bar some three miles long and are working it by pits, using pumps in their claim. They are reported to have struck regular '49 diggings, and in some places washed out \$63 to the pan.

News of these companies have said much about their prospects or what they were doing, having kept rather quiet on this subject. This company that went from here took several old California hydraulic miners with them, and all of them ought to test this country pretty well. That other mines have been worked there in a slight degree is well known, in the days when the country was called New Granada. Quartz has been worked in both Canan and Antioquia. Along the river Saldana in the State of Tolima, there are several rich gold mines already discovered, such as the Cayaine, the Chapparral and the Amoya mines. The richest emerald

VICTORIA SPRING BED.

mines in the world are found in the State of Bayesen on the western side, at a place called Muzo. Some of these are being worked by a French company under a contract made with the Government. On the river La Plata or Papayan, in the State of Antioquia, are several rich mines, where the natives pan out gold in a battea, whenever they feel sufficiently energetic. On the whole, according to the accounts of the country, it affords a good field for miners, and the Government is desirous of encouraging them to work the mines. In our next issue we will endeavor to give further particulars as to water supply, mining laws of the country, etc., which would be likely to interest our readers.

IMPROVED STEAM BOILER.—Harvey W. Rice of Haywoods, Alameda county, has recently patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, an improved steam boiler to be used in connection with threshing engines for utilizing straw and other light substances for fuel, by which he claims to accomplish complete combustion of the fuel without smoke or sparks from the smoke-stack, thus avoiding any liability of creating loss by fire in the harvest field. By his construction of the boiler, the tubes and the tube sheets, inside of the shell of the boiler, can readily be removed at any time, so as to be cleaned or repaired at slight expense. Mr. Rice has constructed two or three of his improved boilers, and reports that they work to his entire satisfaction, and he feels confident that when the merits of his invention become known to threshers, it will be universally adopted.

SINGLE RAIL RAILWAY.—In our last issue we mentioned some facts concerning a single rail railway in Georgia. Mr. Crawford, room 60, Grand Hotel, in this city, has the model of a single rail railway, something like the one described, which the curious can see by calling on him.

An injunction has been issued in Pioche by District Judge Fuller, to restrain the Newark Mining Company from working certain ground. The injunction was issued in the suit of the Washington and Oreole company.

"Flea Seeds" Cynips Saltatorius.

We present this week the engraving of an insect and shell from which it emerged, for the purpose of showing our readers an object which has attracted considerable attention for the past year or two in this State. They were first

"FLEA SEED."

brought to notice by the curious jumping qualities possessed by what was supposed by some persons to be mustard seed, and many theories were advanced as to how the thing was done some of which were quite amusing.

Genus Cynips—L Cynips Saltatorius, (nov. sp.)

Black, shining. Head broad between the eyes, which are very prominent. Antennae 14 jointed, the 1st and 2d joints being much swollen, and the 3d joint longer than the other two, the remaining joints are long, simple and nearly equal. Thorax densely but finely punctured, very globose in front, projecting so far as to almost hide the head. Abdomen globose, shining. Ovipositor cases, short, spatulate received into margined groove in the body. Ovipositor itself flesh color, curved inwardly toward its middle. The abdomen is 6 jointed. Terminal joint of palpi, hatchet shaped. Tarsi very hairy throughout, the anterior pair with six and the remainder with seven joints. Coxae very globose. Tibiae long, with large and powerful spines at the base.

The Victoria Spring Bed.

The accompanying cut shows an improved spring bed, manufactured by W. H. Smith, 151 New Montgomery Street, in this city. Its prominent features are its cheapness, lightness and elasticity. The bed is composed of 192 steel springs, yielding and pliable like watch springs, the helices united by metal clamps, and the whole so arranged that pressure, applied upon any one portion of the surface of the bed, is equally distributed and sustained by all of the springs. This imparts to the bed an even elasticity and general softness, which is a peculiar characteristic, preventing that sinking down of the bed in one spot, and that down-hill feeling of the surface, or sloping towards the place where the greatest weight rests—defects that are common to this ordinary spring beds.

Another striking advantage of this bed is its remarkable flexibility. As shown in our engraving, it may be rolled up like a blanket, forming a convenient package for transportation, and it may be carried about the household with the utmost facility.

Its extreme lightness is a distinctive and important quality, the total weight of a first-class double bed being only 35 lbs. A child may carry it; any woman may lift it with ease. Housekeepers will appreciate this quality, for they can remove and place the bed whenever they require, as easily as if it were a bolster.

Another excellent feature is its security against corrosion, the springs being inlaid with a water-proof fire-enamel, which renders the bed serviceable in any climate, hot or cold, dry or damp.

Both sides of the bed are alike; it can be used either side up; has no attached frame of wood or slats, but is soft, flexible and yielding in every part. In summer time it forms a cool and luxurious couch.

This bed is noiseless and durable. Rolled up for transport, as shown in our engraving, it forms a light, compact bundle of steel springs, which may be sent to any part of the world without risk of damage. At each place where the springs are joined together a piece of leather is inserted inside of the band so as to prevent any noise or scraping. Different sizes of beds are made to suit different bedsteads.

PATENTS & INVENTIONS

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS, AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch, Dated Washington, D. C., Feb 10, 1874.

FOR WEEK ENDING Jan. 27, 1874.

CAR PROPELLER.—Fayette Mace, Jackson, Cal.
FINER BARS FOR HARVESTERS.—Victor N. Collins, Dixon, Cal.

APPARATUS FOR CONVERTING MOTION.—Romulus R. Stevens, assignor to self and Lewis M. Cutting, Stockton, Cal.

SHIRT.—Ismael Zacharias, S. F., Cal.

PLANK ROADWAYS.—Cornelius McGowan, S. F., Cal.

COMPOSITION FOR DRAIN PIPES.—Francis J. Bondryl, assignor of one-half interest to J. Mihy.

SHEARS.—Edward Nnnan, S. F., Cal.

AIR COMPRESSING APPARATUS.—Wm. Johnston, Lima, Peru.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

The Stickeen River Country.

The following Report of exploration of the Cassiar District—a locality now attracting considerable attention among miners—is published in the Oregonian of the 31st ult:

To the Honorable the Chief Commissioner of Lands and Works, British Columbia: Sir—From Fort Wrangel to the mouth of the Stickeen river, the distance is about five miles; from the mouth of the river to the Big Bend, distance about eighteen miles; and the average course east. From the Big Bend to the Great Glacier seven miles—average course north by east. From the Great Glacier to the Hudson Bay Company's post, distance about thirty-eight miles; average course north by east; portion of this part of the river is a great deal cut up by sloughs, snaggy and shallow in the fall of the year. From the Hudson Bay Company's post to Salmon creek, six miles; average course west; also a portion of this part of the river is cut up by sloughs, snaggy and shallow. From Salmon creek to Little Cañon, about seventeen miles; average course north. From Little Cañon to Klutchman's Cañon, nine miles; average course, north by east. From Klutchman's Cañon to Clearwater river, about fourteen miles; average course northeast by north. From Clearwater river to Collins' bar, eight miles; average course north by east. From Collins' bar to Shakesville, about seven miles; average course northeast by north. Three and a half miles above Shakesville there is one riffle, not navigable for steamboats at low water; with high water it is good; and with middling stage can go through this slough, leaving the riffle to your right. From Miller's bar to Telegraph creek, foot of the Great Cañon, distance ninety miles; average course north northeast.

The ice leaves the river from the 24th of April to the 5th or 6th of May. From that time, suitable river steamers can run the river until the first or middle of October, some seasons they may run later, from Collins' bar to the first North Fork.

Vegetables and good potatoes are raised to good advantage. From the Little Cañon up, the snow falls light, from two to four feet. From the cañon down, snow lies, after it has settled, from five to nineteen feet deep in places on the river bottoms. On the Upper Stickeen, the spring opens early; the snow disappears in the latter part of March or the first of April. The weather from the first of May, and through the summer months, is at times excessively warm.

When my sons and I arrived at the foot of the Great Cañon, on the 22d of May, 1873, where we expected to get an Indian for a guide, after a day or two's delay, we started without a guide; as there were no Indians on the Stickeen at that time of the year, we could gather very little information about the trail. The trail follows the Stickeen river for about twenty-five miles, along a bench country, cut up by numerous deep gulches, including the first and second North Forks. At the second North Fork, we were detained two days and a half building a bridge; then the country is tolerably level and dry for twenty miles; then traveling through swamps for twelve or fourteen miles further we came to a mountain which we were obliged to climb; we traveled on these mountains for about fifteen miles, and found ourselves getting into a slate range, which we followed for ten miles or more. This ridge of mountains runs about north and south. The waters of these mountains, as you will perceive by the map, run into the second and third North Forks of the Stickeen river. Then coming to a large valley, running northeast by north, followed this valley for twelve or fourteen miles. There is a large creek running through the center of this valley, with numerous small creeks and gulches emptying into it. I have since proved that this creek is the headwaters of Dease's creek. Not knowing the exact locality of the lake, we turned a little more to the eastward, and struck Dease's lake, about midway between Dease's creek and the head of the lake, on the 13th June, with double packs to each man. A day or two before we got to the lake, we crossed a creek which I prospected, and found a few fine "colors;" cached our provisions; went up the lake and started back to the Stickeen through the valley; arrived at Miller's bar on the 17th June. The first forty miles on the road to Dease's lake, from Stickeen, the feed for animals is good and extensive; but the balance of the way, the feed is not so good, and limited.

Left Miller's bar on the 20th for the lake, with double packs each. Anxious to find out the best practical pack trail, I took the mountain trail, eastward of the third North Fork, which is the trail the Indians travel to Dease's Lake. To the Upper Stickeen, I found this part of the country much higher than what I anticipated; and also numerous swamps and deep moss. Patches of snow lying along the trail in the first part of July.

We arrived at the lake again on the 7th of July. On the 8th we started down the lake. On the afternoon of the 9th we arrived at the mouth of Thibert creek. I went up a short distance and prospected a little; found a few fine colors, and came back to camp. Next morning I went up the creek again; found Mr. Thibert and his two partners, who were all the men who were on the creek; prospected some that day, and returned to camp. Next morning we started to pack our provisions on the creek, which took us several days. On the 15th July, we located our claims on Thibert creek, and got ready to work. On the 25th, I and my son went prospecting on a creek which

we call Delure creek; it empties into Thibert creek. I prospected there until the 30th; found a little gold but not in paying quantities. I ran a cut in one place; found a little gold in the gravel, but none on the bed rock, as the rock was smooth washed. In other places I could not get to the bed rock on account of water, as the creek was high.

Thibert creek has turned out very good, but there is a great drawback on this creek—that is frost—in some places on the shady side of the creek the ground is frozen right down to the bed-rock.

The Rath Co., Collins Co., Reynolds Co., Discovery Co., and the Waldon Co., are considered the best claims on Thibert creek. These companies have made from two to four ounces a day to the hand; all working with rockers, except the Waldron Co., who had sluices.

Not being well and having a sore leg, I was unable to travel. On the 19th of August I sent my two oldest sons out prospecting. They arrived on Dease's creek on the 20th, and on the 23rd staked off the Discovery claim, and came to Thibert creek on the 27th, with a prospect of 20 cents to the pan, having prospected the creek about three miles, and found paying prospects all the time. But this did not start the miners from Thibert creek; they said it was only a few spots of fine gold; but according to what my sons told me of the creek, I was satisfied there was good digging on this creek and sent them over again on the 29th. On the 2d of September, I sent my youngest son and an Indian with packs of provisions; when they came back again, I started over, and found my sons running up a drain and washing the gravel with a rocker, which paid them five ounces a day; they had been rocking then two days. I also went up the creek and prospected. Being satisfied that the creek was rich and extensive, I returned to Thibert creek, and informed the miners that the creek was good. Nearly all of them went over to Dease's creek and located ground. All found big prospects, that will pay from ten to one hundred dollars a day with sluices.

On the 24th of September, the weather turned cold, with a northeast wind, and continued so until the 29th; then it started to snow, with a northeast wind; all the miners leaving the creek. It continued cold, and snowing heavy, until the 1st of October; we then packed up and left. Found Mr. Rath and brother at the mouth of the creek, and traveled out together; weather very cold, and blowing a heavy wind, with snow. On the 3d of October it moderated. By this time the snow was from 20 to 30 inches deep; the same day it commenced to rain. On the 7th we arrived at Buck's Bar.

Dease's Lake opens from the 15th to the 25th of May.

Yours Respectfully, WILLIAM MOORE.
Victoria, B. C.

PORT WRANGLER.—This place, which is now attracting no little attention as the embryo American city in the extreme Northwest, and the commercial entrepot to the recently discovered gold placers in the Cassiar country, is located near the north end of Wrangel Island, and is about five miles from the mouth of Stickeen River. It was, years ago, settled by the Russians, who built a trading post on what is known as Etaline Harbor. Soon after Mr. Seward's purchase of the country, the United States authorities built a large stockade fort near the site of the old Russian House, which they occupied until 1870, when the buildings were sold to W. K. Lear, by order of the War Department. They have been occupied by that gentleman since that time. Mr. Lear has established a thriving trading post and has carried on a lucrative business with the Indians of the coast and the Stickeen. The town already contains sixteen substantial buildings, and preparations are being made for further improvements. A vessel is now loading at the Sound with lumber, and a substantial wharf is to be built in time for the spring trade. In Monday's dispatches it was announced that the Post-office Department had established a Post-office at this place, to be known as Fort Wrangel, with William King Lear as Post-master. This will prove a great convenience to those parties who design visiting the new gold fields.—Oregonian.

SWOCK MINES.—A correspondent of the Walla Walla Union writes as follows of the mines on the Swock river: Several claims that have been opened on the Swock are now being worked with encouraging results. The weather is about as mild there as in this valley. Persons have been coming in and going out all winter. The snow has not been to exceed twelve or thirteen inches at its deepest, and at this time there is not more than six or seven inches, and should the present weather hold a few days longer the whole country will be rid of snow, except on the highest mountains and the intervening gulches. Five persons a few days ago passed up through the valley from below en route for the diggings. This would appear to be timely. It shows that there are some persons who have faith in these mines, notwithstanding the many counter rumors afloat to the contrary. Those who are fixed for it can mine now just as well as any time. There is no freezing of nights, and the days are warm and fine. The old ice is about the only drawback there is to successful mining at present.

It is a notable fact that in only one or two of the many recent wedding receptions in New York has wine been served. And it is supposable that the participants enjoyed themselves themselves none the less from the fact.

Utilization of Mineral Waste Products.

There are numerous useful applications of mineral waste that might be cited. Immense heaps of refuse, or "tailings," as they are technically termed, accumulate where mining operations are carried on upon a large scale, as in Australia and California. These contain a good deal of metal, which is now frequently economically recovered. The Chinese especially manage to make profits out of old waste heaps. A mine owner at the Sandhurst gold-field, in Victoria, sold the right to wash a large heap of tailings to the Chinese three times, and each time the men seemed satisfied with the result of their labors. There are immense heaps of tailings containing auriferous pyrites in Victoria, which if properly stacked and operated upon on a large scale, would yield nearly all the gold they contain, at but little cost of money or labor. The yield of gold thus obtained in Victoria from 1869 to 1871, by operating on about 8,200 tons, was at the rate of rather more than two ounces fourteen pennyweights per ton. At one large establishment twenty-five tons of pyrites on the average are now treated per week, the yield being at the rate of more than three ounces six pennyweights of gold per ton.

Some few years ago the Greek Government sold for a mere trifle to two foreigners their right over the rubbish heaps at the Laurium mines, which were first worked several thousand years ago, by the King of Athens, from the profits of which Pericles is said to have built the Parthenon. A company was formed to work them, for it was soon found that even the debris, which had been cast aside by the ancients as worthless, possessed great value. Extensive beds of scoria, the refuse of the silver and lead mines worked during eight centuries by the Athenians, now yield to modern metallurgic skill some 7,000 to 8,000 tons of lead annually, which contains silver in the proportion of about one-half per cent. The company now conduct their operations on so large a scale, that a town containing 4,000 inhabitants has sprung up on what was formerly a solitude; a railway has been constructed to the nearest port, and a small vessel plies twice a week between Argosteria and Piræus, for the transport of the argentiferous tailings to the roasting furnaces, of which there are twelve at work.

When sulphur became scarce and dear, owing to the monopoly in Sicily, our manufacturers who depend so much upon sulphuric acid, looked about where they could supply the demand, and pyrites, a waste mineral substance, was seized hold of, and now we import upwards of half a million tons annually from abroad, of the value of more than £1,400,000, besides a quantity obtained at home. The residue of the iron pyrites, after extracting the sulphur, is used in blast and puddling furnaces.

There exist in various parts of the globe sea-beaches and beds of titaniferous iron-sand, a material formerly valueless. Now it has begun to be utilized in various ways as a molding sand, for making paint, and the manufacture of high-class steel.

Other instances of the useful application of formerly waste substances that might be cited, are the petroleum oils, now forming so extensive an article of commerce, the asphalts, ozokerit, asbestos, etc., to say nothing of the immense trade in old soap iron, old lead and copper, and the recovery of tin from tin clippings. The slag and scoria of metals have now many industrial applications. The alkali and other wastes recovered from our chemical manufactures form now very profitable industries.—Artisan.

Resources of Utah.

In an article on this subject the Utah Mining Gazette says: The Territory of Utah contains an area of 70,000 square miles, and is situated between 37° and 42° of north latitude, and 109° and 114° west from Greenwich, and has a population of over 100,000 souls.

The principal products are minerals, of which nearly every variety has been found in greater or less quantities. Free gold has been discovered in Bingham, and is found in connection with other metals, in many of the ores of the different districts. So far, however, gold has not been discovered in sufficient quantities to make it an important product. Copper also is found in several of the mining districts of Utah, viz: Ophir, Tintic, Bingham Cañon and Bear Valley. Iron ores of excellent quality are plentiful in Weber and Cache Valleys, and Iron and Washington counties. The smelting, however, of iron ores on a large scale, has not yet been commenced, although arrangements are being perfected to engage in the business at an early date.

Coal of good quality is found in many parts of the Territory, and the last returns from the Surveyor-General's office, show that some 45,000 acres of coal lands have been surveyed in Castle valley and along the Weber river; besides which there are immense deposits in Sanpete county, in Southern Utah, and other sections.

We have also gypsum, niter, alum, bismuth, cinnabar, pyrolusite, marble and fire-clay. Of the last named article, extensive deposits have been found in Brigham cañon; and clays suitable for pottery ware, abound in the neighborhood of Sanpete and Ogden. Building stone of every description is plentiful, limestone forming the chief rock of the country.

Utah is traversed by a great mineral belt

about seventy miles in width and several hundred miles in length, running in a north-easterly and south-westerly direction, and covering a wide range of metalliferous deposits. Valuable discoveries have been made in chlorides and horn silver, varying from \$500 to \$2,700 per ton.

How Sargent's Bill will Work.

Under the head of "A Bad Section to a Bill" the following is communicated to the Stockton Independent:

Senator Sargent has introduced into the Senate of the United States a bill providing for the disposal of the greater part of the public mineral lands in California. This bill was introduced some while ago, but was so clearly objectionable that its author amended it, but as amended, it is so plainly defective that it should never become a law. The present methods of procuring title and settling conflicting claims to mineral lands are perplexing and uncertain enough without the introduction of any other element of confusion. The Senator is himself a miner and very familiar with mining laws, and the wants of that class of our people, but he nevertheless greatly mistakes the wishes of the miners when he would give the force of law to the fourth section of his bill. That section is as follows:

"Section 4. That all affidavits and proofs required by law to be made before local land offices in mining or preemption cases may be taken before any officer authorized to administer oaths, and when filed with the Register and Receiver shall have the same effect as if taken before those officers. Effect shall be given to this Act by regulation to be prescribed by the Commissioner of the General Land Office; provided, that when such affidavit or proofs are taken at any place other than within the land district, it shall be by the Clerk of any Court of record in the United States."

It is true enough that the present laws in reference to taking evidence and making affidavits in preemption, homestead and mineral cases, work a hard hip in certain individual instances, but it is the same hardship that is wrought by all laws of a general nature, as the revenue laws and the laws concerning jurors for instance. Taxation, from its very nature cannot be reduced to a system of practical uniformity any more than it is true that all jurors within a given jurisdiction can live within a mile of the Court House, or go home and remain with their families over night while discharging the duties of jurors. But the exceptional cases of hardships do not prove that taxation may not approximate uniformity any more than they establish a reason for dispensing with jury trials altogether.

Under existing laws and the instructions of the land department there is something like certainty as well as dispatch in the settlement of disputed claims to mineral lands, whereas under Senator Sargent's no claimant will be able to guess, much less see, the end of his dispute. Now, under this section four of the proposed law, the officers or persons who will be authorized to take evidence in contested preemption and mineral claims, are District and County Judges, County Clerks, County Assessors, Notaries Public, Justices of the Peace, Police Judges and ministers of the gospel, and so on, who, as a rule know about as much about the prescribed course of procedure in such matters as they do about the "Moabite stone"—always excepting District and County Judges and ministers of the gospel, though these exceptions are hardly worth mentioning. We will take not a very extreme case, by way of illustration, and just see for a moment where the Senator's law would end up: Say the land in dispute is on a sixth section; it is claimed by A as State school land; by B as a pre-emption; by C as a homestead, and by D as mineral. Locate the land within the limits of Poker Flat. Well, having laid a foundation for a considerable dispute, A having got a State patent, sues B and C in ejectment, and their time expires on the 23d day of August, 1874. The county seat is at San Andreas. But, in the meantime, B has cited all the rest to appear before the County Assessor at Mokelumne Hill on the same 23d of August, 1874, to show cause why he shall not be allowed to make final proof as a preemption claimant; still, in the meantime, C has cited all the rest that he intends to commute his homestead into a pre-emption and make final proof before Justice Numskull at Ragtown on the same 23d of August, 1874, while D, taking advantage of this crooked law, cites all the rest to Whisky Hill, where, before Deacon Stiggins, on the self-same day, he proposes to clearly show that he is entitled to purchase the land as mineral. Well, to proceed, on the same 23d of August, 1874, at San Andreas, A gets judgment in ejectment against all the rest by default. B at Mokelumne Hill, shows his right as a pre-emptor. C, at Ragtown, commutes his homestead, and at Whisky Hill D establishes his right to purchase the land as being mineral. Thus far each claimant has succeeded well, he has, in fact, got along swimmingly, but now comes the rub. On the evidence and record made in the four different tribunals the Register and Receiver are required to decide which of the claimants has the better right to the land, and if it can be shown that they can do so without any difficulty, we will support the bill, otherwise we shall have to vote against it.

ANALYSIS OF SOFT SOAPS.—According to the analysis of M. Herm, these soaps were found to contain Prussian blue, resin, starch and sulphuretted hydrogen, besides the fatty acid and alkali. The method of analysis is given somewhat in detail.

Cornucopia Mines.

A correspondent of the *Enterprise* gives the following condensed description of the mines in Cornucopia District, Nev:

Leopard.

This mine is the discovery and "brag mine," around which the others cluster. The Superintendent, Wm. Garrard, is pushing the work of development rapidly, and his reward in ore increases every day. He calculates by spring to have five hundred tons of ore that will mill \$800 per ton beside any quantity that will mill from that figure downward.

Grant Hussey Tunnel.

This mine is situated directly east of the Leopard and immediately adjoining. The tunnel is in about one hundred feet, at the end of which they are sinking a shaft in the ledge. The ore taken out is of excellent quality—working and assaying better than its looks would indicate. This mine employs four men.

Handy's Claim.

The shaft in this mine is down about eighty-five feet in good ore. There is considerable ledge water in the shaft which is a good indication. This claim conflicts with the Leopard.

Cope Mine

Is owned by Cope, the discoverer of Cope District. He is working this mine when the weather permits. Plenty of ore on the dump. This mine also conflicts with the Leopard.

Chloride.

This Chloride is situated northeast of the Leopard and has been leased to Grant, Plummer and Anstin, who are engaged in sinking a shaft on the ledge. The ledge is small, (18 inches in width,) with well formed and perpendicular wells. The ore is splendid, showing considerable horn silver. The shaft is down twenty-seven feet. Some of this ore was shipped to Winnemucca last week for reduction. Returns not yet known.

Black Diamond.

This mine is directly east of the Leopard, distant a quarter of a mile. They have abandoned their shaft temporarily and commenced a tunnel. In about thirty feet; calculated to strike a ledge at about seventy-five feet further east.

The Constitution

Has commenced a drift from the bottom of their shaft yesterday. They struck the ledge and cut through it. The ledge is very hard and appears to have considerable mineral in the ore.

The Carrie Mine

Is being worked by Messrs. Hutchinson & Terry. The incline is down about forty feet, having excellent ore in abundance from the beginning. They have several tons of ore on the dump which assays \$500. The Carrie is destined to be one of the leading mines of this district.

The ore of this district is uniformly free from base metal and exceedingly easy of reduction. The general character of the ore is sulphurets, not chlorides.

Surrounding Districts.

Bull Run—Little is known about this camp. They have some excellent mines there, one of which, the Blue Jacket, was sold two weeks ago for \$15,000 to parties in Eureka. They propose commencing work on it immediately and have already shipped considerable stores to the mine. Some day this camp will be a lively place.

Cope district has probably seen its best days. Still there are good mines there that will pay very well for the working, if managed properly. Tinscarora is situated at the head of Independence Valley. Placer mines abound, worked principally by Chinamen, who make from \$3 to \$5 per day out of them.

The Surrounding Country.

In no portion of the State is there better land for stock raising. All the year round the hills are covered by bunch and rye grass. Bull Run basin is one large meadow, from which numerous herds of cattle and horses obtain sustenance. Independence Valley in summer is covered with thousands of head of cattle. During the severer portion of winter they have to be driven south, as the snow covers the valley to the depth of eighteen inches.

Game.

Game abounds throughout the country. In winter, ducks of all descriptions, hare, rabbit, sage hens, prairie chickens and blue grouse. Let me here make an observation to the sporting men of Virginia and California. I see by the papers that they are importing game birds for propagation from the East at great expense, while here we have the finest game birds in existence, prairie chickens, etc., which belong to this country. They thrive and multiply rapidly in just such a climate as surrounds Virginia. Why don't these men, who love fine shooting, procure some of these birds and turn them into the sage lands of the Carson? The expense would be nominal compared with what it is to bring them from the East, with much more gratifying results, as they are already acclimated.

Beef.

Beef of the very best quality can be bought by the quarter here for 7 and 8 cents per pound. Such beef as you cannot procure in Virginia without paying an exorbitant price. There is a joint-stock company here (of which Abe.

Edgington is a member) whose cattle roam through the country and number thousands.

Mills.

Now is the time for some enterprising company to bring in a mill; the roads are in their best condition, better than in summer or fall; in two months more the roads will be almost impassable, owing to the deep mud.

Mill Sites.

The river Owyhee runs within three miles of this place, and affords excellent water power, with plenty of wood at hand. Deep Creek is two miles distant, easy of access from this place and would furnish plenty of water for a good mill.

Wood.

Wood is abundant within fifteen miles, easily hauled, with good roads for hauling.

Every one is anticipating good times this summer. I sincerely hope for the benefit of the camp that parties holding conflicting claims will compromise for their own good, and the good of the camp.

Accidents in Coal Mines.

They are divided broadly into five groups or categories, viz., explosions of fire-damp, falls of coal from the "face," as it is termed, of the seam, or from the roof; accidents in shafts from ropes or chains breaking, overwinding, etc., miscellaneous accidents underground, such as explosions of gunpowder, suffocation from gases, accidents from trams and tubs, etc.; and accidents on the surface by machinery, boilers bursting, etc. The total number of deaths in England from all these causes amounted last year to 1,060, the majority of which were due to separate accidents. In the first category, explosions of fire-damp, the deaths numbered 154; in the second, falls from the face or roofs of mines, they numbered 456; in the third, accidents in shafts, they numbered 155; in the fourth, miscellaneous underground accidents, they numbered 217; and in the fifth, accidents on the surface, they numbered 78. It will be perceived that of all these classes of accident by far the most frequent is the second, that of falls of coal, either from the face of the seam, upon which the men are at work, or from the roof of the mine. Falls from the roof are stated to have been more than usually numerous last year, owing partly to the large number of inexperienced hands employed in the collieries. It seems that it requires many years' experience to enable a man to gangle the safety of a roof, and to render a dangerous place really secure. But, apart from the question of inexperience, many deaths might have been averted if the timbering of the working places had been carefully watched by the persons in charge. We are glad to see that the inspectors of mines are pretty generally of opinion, that if the provisions of the new Mining Act, which came into operation on January 1, 1873, be fairly carried out, a material reduction will be effected in the number and nature of accidents under this head; the owner, agent and manager being now held responsible for the security of the roof and sides of every "traveling road and working place."—*American Artisan*.

MARINE SCHOOLS.—Sargent, from the Senate Committee on Naval Affairs, has reported a fifth amendment to the bill to encourage the establishment of Marine Schools, as amended by the Committee. It provides that in order to promote nautical education, and to educate officers and seamen for the merchant and naval marine in scientific and practical navigation, and in arts, trades and occupations pertaining to seamanship, the Secretary of the Navy shall be empowered to supply, upon the written application of the Governor of a State, or the authorities of the cities of New York, Boston, Philadelphia, Baltimore and San Francisco, a suitable vessel, with all her apparel, together with charts, books and instruments, if the same can be conveniently spared, from the Public Marine Schools, in each of the above named ports, and the ships and materials so furnished may be loaned to said cities or States in which they are situated, upon condition that said States or cities establish at their own expense nautical schools for the education of youths desirous of entering the merchant or naval marine, or, if already in service, of improving their nautical education. The President of the United States may detail naval officers to act as superintendents or instructors of these schools. In conclusion, the bill provides that no person shall be sentenced to or received at such schools as a punishment, or commutation of punishment, for crime.

THE ST. LOUIS MINE PATENT.—A dispatch from Washington says: The decision in the case of the application of the St. Louis Mining Company of Nevada for a patent, has been delayed in the Land Office, and further testimony has been offered which will have little effect in changing the condition of the case. The application is not considered as made in good faith, and is looked upon as an attempt to get possession of neighboring mines. The St. Louis is a new name for the Hidden Treasures Company.

Work on the cinnamon mines, recently in Oregon discovered in the Coast Range of mountains, has been suspended on account of the snow, which is seven feet thick and quite wide around there.

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.
PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the *MINING AND SCIENTIFIC PRESS*. We transact every branch of Patent soliciting business, obtaining Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. **ADVISE AND CIRCULARS FREE.**

Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent, Price \$3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LEICHTENBROS. & MANSUR, San Francisco. 10v25-1y

That Obnoxious Mining Bill.

Ward's Mineral Land bill, compelling miners to expend \$500 and buy their claims for \$10 per acre within one year, to which we have frequently referred, is universally condemned. Our representatives in Congress are opposed to it, and the Legislature has instructed them to oppose its passage. The whole press of this coast condemns the bill, as does every mining man with whom we have conversed. We suggested at the time of making our first comments on the bill, that as the bill would make considerable business for the lawyers, perhaps Mr. Ward was one who had business in view for his friends. The Washington correspondent of the *Bulletin* says concerning it: "It is understood to have been presented by the Illinois representative at the instance of a well-known mining lawyer of San Francisco who may have not been unmindful of prospective fees in the rush for patents and the scramble of litigation which would follow its enactment. The same gentleman is said to be the originator of a movement now on the tapis to extend the land surveys over Alaska, with a view to acquiring titles to sundry extensive tracts of coal land in that region."

"That accounts for the milk in the cocoanut." However, the bill is not very likely to pass, as Mr. Page is a member of the Committee of mines and mining, to which it has been referred. All of our representatives are opposed to it, and moreover it has occasioned such a storm of indignation that the members of Congress will look into it carefully, and must see its impracticability. Concerning this bill a practical miner writes to us as follows:

I have been reading Mr. Ward's bill, and if it passes, in effecting the object proposed it will promote the depopulation of all the mining States and Territories to a great extent, because, after we have expended \$500 in development of a location, we find ourselves without the means to defray expenses of procuring a patent. In fact it often requires much greater developments before we can feel assured that we have a mine valuable enough to justify the expense even if we had the funds. After we have complied with the law under which we locate, we feel that the property belongs to us already without the sanction of a patent, which we may or may not desire, and the Government would be acting in bad faith with us now to undertake to withdraw rights and privileges heretofore granted. So far as it affects prior locations, I very much doubt whether Mr. Ward's bill could legally apply; with it in force, the time would be short before the matter would become the subject of judicial investigation, when the question would arise as to whether the Act did not impair the obligation of contracts, in violation of the Constitution of the United States.

So far as new localities are concerned, of course we are bound to submit to such laws as are in force at their date, but with such a law as Mr. Ward would give us, we would seldom hear of a new discovery, for prospecting would cease, as the inducements would all cease to exist.

From your issue of Jan. 24th, I find you have commenced ventilating the accursed thing, and I hope the whole Press of this coast will join you in it. Your remarks are in perfect accord with the sentiments of all miners, who will be glad to find the subject receive further attention in the *MINING AND SCIENTIFIC PRESS*.

LEATHER.

SAN FRANCISCO, Wednesday M., Feb. 11, 1874.

Leather is quiet and firm. A similar feeling rules in the New York market. In 1873 California shipped to New York alone 83,000 Hides. We think that the day will soon arrive when such shipments of raw material from the State will cease. We have every facility for tanning our own leather here—good sites, large supplies and low rates; and a variety of native animals. As it is our Country Leathers are comparatively low, and do not fully represent our capabilities. Findings and Linings are moderately active.

Of real merit, if brought plainly before the public when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the *Press*. Superior Engravings Made, at reasonable rates, by artists in this office. up-1f

SAN FRANCISCO METAL MARKET.

WEDNESDAY M., Feb. 11, 1874.

Metals generally are quiet. Braziers' Copper has declined. Tin Plates are firmer. Cast Steel is in slightly better request. An exchange says that during the past year there has been a considerable increase in the use of American Lead for all purposes except ordnance, and a corresponding decrease in the importation of ordinary foreign Lead. While Missouri has produced a little more than in previous years, and Galena its usual amount, the Nevada and Utah mines have been greatly developed. The percentage of Gold and Silver in the bullion produced by mines in these last named Territories is so high that the Lead in its secondary consideration.

SHAREHOLDERS, TRUSTEES, AND SECRETARIES OF ALL MINING COMPANIES.

Should see to it that their Notices are advertised legally in the *MINING AND SCIENTIFIC PRESS*, at much less cost than the usual rates of daily publications. Every person interested in the property of legitimate mining enterprises should favor such practical economy. Send for circular of convenient notes for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Mining and Other Companies.

Due to the time necessary to mail the present large edition of the *M. & S. Press*, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Buena Vista Petroleum Company—Location.

Location of principal place of business, San Francisco, California. Location of works, Kern County, California. Notice is hereby given that at a meeting of the Board of Directors, held on the 28th day of January, 1874, an assessment of No. 22, at one dollar per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 430 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 18th day of March, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, J. M. SPINNEY, Secretary.

Office No. 430 Jackson street, San Francisco, Cal.

Diamond Silver Mining Co.—Notice.

A meeting of the stockholders of the Diamond Silver Mining Company, of Placer County, California, at the office of the company, No. 430 Jackson street, San Francisco, California, on the 18th day of February, 1874, at one o'clock P. M., at Sherman's Building, No. 606 Montgomery street, Room 12, for the election of Trustees for the ensuing year. The subject of levying an assessment upon the capital stock of the company will also be determined.

By direction of the Board of Trustees, W. M. SPINNEY, President. O. M. MILLER, Secretary. San Francisco, Cal., January 12, 1874. ja-5t

Commercial Coal Mining Company, of

San Francisco. Principal place of business, City and County of San Francisco, State of California. Notice is hereby given that at a meeting of the Board of Directors, held on the 10th day of December, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A. E. Crocker	135 and 136	50	25 00
A. E. Crocker	138 and 141	75	37 50
H. Forrester	179 and 188	100	50 00
H. Forrester	192 to 206	255	127 50
J. Forrester	4	100	50 00
S. B. Hanson	128	10	5 00
W. E. Peck	175 and 176	20	10 00
H. E. Shepherd	185 and 186	175	87 50

And in accordance with law, and at order of the Board of Directors made on the 10th day of December, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the

of the company, No. 402 Montgomery street, Room No. 23, city and county of San Francisco, California, on the 23rd day of February, 1874, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

S. B. HANSON, Sec'y. (By F. N. W.) Office, 402 Montgomery street, Room No. 23, San Francisco.

Cupel and Tiger Silver Mining Company.

Principal place of business, San Francisco, Cal. Location of works, Wallapai Mining District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 25th day of October, 1873, the several amounts set opposite the names of the respective shareholders as follows:

HEALY & JEWELL, Agents.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY
CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick- silver. 1870.

This rare book on the treatment of gold and silver
ores without quicksilver, is liberally illustrated and
cramped full of facts. It gives short and concise de-
scriptions of various processes and apparatus employed
in this country and in Europe, and explains the why
and wherefore.

It contains 142 pages, embracing illustrations of fun-
naces, implements and working apparatus.

It is a work of great merit, by an author whose repu-
tation is unsurpassed in his specialty.
Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), in- cluding the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, em-
bracing the subjects treated. Its authority is highly
esteemed and regarded by its readers; containing, as it
does, much essential information to the Miner, Mill
man, Metallurgist, and other professional workers in
ores and minerals, which cannot be found elsewhere
in print. It also abounds throughout with facts and
instructions rendered valuable by being clearly ren-
dered together and in simple order. It contains 120
diagrams, illustrating machinery, etc., which alone are
of the greatest value. PRICE REDUCED TO \$5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final cast- ing of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of
information, applicable to all vein miners and workers
in precious metals, affording hints and assistance of
exceeding value to both the moderately informed and
the most expert operator.
Price, \$5 in cloth; \$5 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, \$2.

Sulphurets; What They Are, How Con- centrated, How Assayed, and How Worked, with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867, cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, \$1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at
the most reasonable rates by Dewey & Co., Mining and
Scientific Press Office, S. F.

For medium and sandy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.
Its EXCLUSIVE use saves from 30 to 60 per cent. in expense, besides doing the work in half the time
required for black powder.

The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

General Agents, No. 210 Front Street.

v22-3m16p

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the ad-
vertisement of Mr. F. H. Fisher. Said Fisher has been
beaten in every suit to which he has been a party (re-
specting Patent Rights on Hydraulic Machines), whether
as plaintiff or defendant.

His patrons have already paid over Five Thousand
Dollars for license to use machines purchased of the
self styled

"Only Reliable Party in the Business
Who Protects His Customers."

Fisher's Machine is worthless unless the discharge
pipe is furnished with appliances, the patent for which
is owned by Messrs. CRAIG, and which Fisher is en-
joined from making.

The Machine itself is also an infringement on another
patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured
under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my
Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction,
and do not want to pay for it twice over, buy an im-
proved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,

Or R. R. & J. CRAIG,

304 Montgomery st., San Francisco.

WILLIAMSON & CORY, Marysville.

Dutch Flat, August 10, 1873.

Number 8.

A Quicksilver Pump.

At some of our large quartz mills, where heavy quantities of quicksilver are used, great difficulty is experienced in providing proper pumps for raising it. Mr. Martin P. Boss, of Bullionville, Nevada, has recently invented a pump to raise this metal, which he has patented through the SCIENTIFIC PRESS patent agency. The difficulty in pumping this metal is from its great weight, and consequent action in keeping all lifting valves of whatever material open, by floating them up, and thus preventing the pump from working. By Mr. Boss' construction of the pump, he is enabled to so arrange the different parts that no leakage or waste of metal will occur, and the valves will work well.

By referring to the accompanying engravings the operation will be understood. Fig. 1 shows an elevation of the pump. Fig. 2 shows the pump in detail and the manner in which the quicksilver is drawn from the settlers into the pump, and forced into the tub ready for use again. A is the barrel of the pumps, within which the piston, B, moves through a suitable stuffing box, C. D is the induction pipe, having below it a chamber, E, within which the valve, F, works. Any suitable form of valve may be employed, being made to open downward, but Mr. Boss prefers to use a ball of iron, and the chamber, E, serves as a cage within which it works. A passage, G, opens from the bottom of the chamber, E, into the pump cylinder below the piston. Another passage extends from the opposite side of the pump cylinder and opens into the chamber, I, which is situated below the passage, H. This chamber has also a downward opening valve, J, and from below this valve a passage, K, opens into the discharge pipe, L.

The whole of this mechanism may be bolted by means of lugs into the bottom of a basin or tray, which is easily secured wherever desired. By means of this the inventor is enabled to catch any quicksilver which may leak from the pumps. In those now in operation, the valves, valve-seats and plunger are of steel; the seats screw in to allow removal for grinding in valves. Instead of being attached to a tray at the bottom, it is cast to an upright bed-plate, which has a pulley and crank at the other end. A suitable receptacle is placed underneath to catch leakage. This bed-plate is bolted to a post, the extreme length of pump being four feet four inches, so that it occupies a very small space.

In operating the pump, the quicksilver is run into the bowl, S, (Fig. 2,) attached to the settler. Its discharge-pipe rises one inch above the level of the settler-bottom inside. The quicksilver runs into the strainer, T, from the bowl, S. From the strainer, T, it falls into the tub, U. The pipe, A', from the tub, U, will always stand full, as the pipe, D, with which it connects with the pump is on a level with the bottom of the tub. V is an air-vent to avoid suction. The pump being operated, the metal runs up the pipe, L, into a reservoir, W, one foot above the level of the pans. The pipe, B, leads from this under the floor and back of the pans, branches from it discharging into the measures, Y or Z, through an iron cock. The discharge from the measures, Y or Z, to the pans may be regulated by iron cocks, c', or by the wooden plugs shown in Y.

The operation is as follows: The piston of the pump being drawn up, the quicksilver will be drawn into the pump barrel from the tub, U, and pipe, A' through the pipe, D, valve, F, and chamber, E. When the piston is again forced down, the valve, F, floating upon the quicksilver, will be immediately closed and the valve, J, will be forced open, thus allowing the quicksilver to escape into the passage, L. The valve, J, will also be floated by the quicksilver and the two valves will thus be kept to their seats. By this action the quicksilver is raised up into the receptacle or reservoir, W, at a height above the pans which admits of its being drawn off as before described, by its own gravity.

A quicksilver pump of this description has been in use in one of the Raymond & Ely mills for over six months, and one has lately been put in the other mill of the same company. Parties desiring further information can address Martin P. Boss, Bullionville, Lincoln county, Nevada.

The Comstock Mines.

The county assessor, of Storey county, Nevada, furnishes to the Gold Hill News an

Fig. 1

Boss' Quicksilver Pump.

Operation of Boss' Quicksilver Pump.

abstract statement from the assessment rolls of the proceeds of the mines of the county for the quarter ending December 31st, 1873. We take the following figures from it: The Belcher

mine produced 41,674 tons of ore, the gross yield of which was \$2,871,133 06; net yield, \$1,896,647 46. Consolidated Virginis, 11,296 tons; gross yield, \$644,582 27; net yield, \$342,326 46. Caledonia, 1,583 tons; gross yield, \$22,148; net yield, \$4,429 60. Chollar-Potosi, 9,358 tons; gross yield, \$163,029 46; net yield, \$32,605 89. Crown Point, 33,940 tons; gross yield, \$1,347,891 15; net yield, \$539,156 46. Empire, 3,180 tons; gross yield, \$44,609 60; net yield, \$8,921 92. Hale and Norcross, 5,405 tons; gross yield, \$37,425 03; net yield, \$17,485 01. Silver Hill, 864 tons; gross yield, \$5,935; net yield, \$593 50. Sierra Nevada, 5,160 tons; gross yield, \$32,917 13; net yield, \$3,291 71. Justice, 2,252 tons; gross yield, \$18,016; net yield, \$1,801 60. Woodville, 700 tons; gross yield, \$14,160; net yield, \$7,510. Total net yield, \$2,854,769 61 for the quarter.

THE SIGNAL SERVICE BUREAU.—With the approval of the Secretary of War, and at the suggestion of Professor Henry, the signal officer has assumed charge of the system of meteorological observations hitherto conducted by the Smithsonian Institute. Volunteer observers heretofore reporting to the Smithsonian Institute are requested to continue their labors, reporting to the signal officer. Stamped envelopes with blank forms of instruction will be supplied on application to the chief signal office; and whatever aid can properly be given by the War Department to facilitate the researches of voluntary observers who have heretofore reported to the Smithsonian Institute will be cheerfully tendered. In recognition of their assistance it is proposed to furnish such observers, as may by this arrangement become correspondents of the Signal Office, with copies of the various papers published by it. Monthly records of observations made since January 1, 1874, in the form hitherto addressed to the Smithsonian Institution, may hereafter be mailed, addressed to the chief signal officer at Washington.

MAP OF SIERRA COUNTY.—The high relief topographical map of Sierra county and a portion of Plumas county on a scale of 1½ inches to the mile, referred to in a recent issue, was made by Charles W. Hendel, U. S. Deputy

Burning Quartz Before Crushing.

We see by our English exchanges that some experiments have recently been tried with what is called a new process of treating quartz, discovered and patented by Mr. E. Reading, of Sydney, Australia. As far as the experiments have gone, they are said to have been highly successful. It is described in brief as follows: The treatment consists first in burning the quartz; and, then, whilst red hot, plunging it into a bath prepared with acids. The effect of this is to utterly destroy the silica in the quartz, and to render it perfectly friable, so much so that it can be readily reduced to powder by the Chilian mill, without the intervention of the ordinary crushing battery. Besides this, the silica being destroyed, what had previously been stone is converted into an earthy matter, which is carried off easily by a gentle flow of water through the basin of the mill. The sulphurets, too, are all destroyed, and the quicksilver continues bright and lively, taking up every particle of the gold, however fine.

We do not think that there is much of anything new in this process, nor is it of any practical value. It is now over seventy-five years since Professor Trunks, of Bavaria, discovered that silicates were soluble in caustic ley, under a high pressure of—say about five atmospheres. The process has been carried on in various parts of Europe on a large scale, and this dissolved quartz is used in a liquid state for fire-proof paint—or other purposes. Instead of "destroy" the silica, Mr. Reading probably means "disintegrate" it.

It is a common thing for miners in this country when running an *arastra*, to burn the quartz, and then "slack" it in water before grinding it. This is, of course, only done on rich, selected rock, where a few hundred pounds at a time are worked. It never could pay to do it on a large scale, as the fuel would cost more than it came to. The writer, in pounding up selected rock on a mortar, operated with a spring pole, always burnt and slacked his quartz before crushing, as did the other miners in the same locality. All those who run *arastres* did the same thing, as it made a very great difference in the time required to crush it. In these cases, however, only selected rock of a high grade was crushed.

Burning the quartz and subjecting it to a bath of acids would be even more expensive than burning it and dropping it in water. It would, therefore, be impossible to apply the "improved process" in other than exceptional cases; and, where a large quantity was worked, it would be impracticable altogether. It has been shown that quartz can be dissolved, and the gold in the rock set free, but it is not by any means practical, and never went any further than experiments. Somebody must get up a cheaper process than the one referred to, before quartz will ever be worked in any other way than it is now.

OCEAN SOUNDINGS.—The U. S. Steamer *Tuscarora*, now engaged in taking deep sea soundings in the Pacific, arrived in Honolulu on the 2d inst. They took 62 soundings in a direct line between San Diego and Honolulu, the soundings averaging 40 miles apart. The greatest depth was found near the Islands—3,054 fathoms, or about 3½ miles. The soundings were all made with Belknap's improved apparatus, attached to a piano wire. The quickest time made was in a sounding of 2,562 fathoms, in 1 hour, 28 minutes, 8 seconds; the next best was at a depth of 2,936 fathoms, in 1 hour, 50 minutes 47 seconds. These times include the total time occupied from the moment the sinker left the surface of the water, until a specimen of the soil was brought up from the ocean bed.

MASTODON.—It is stated that in the State of Antioquia, U. S. of Colombia, while some men were digging in search of a salt spring, they came upon the skeleton of a mastodon, the tusks of which weighed over 40 pounds each.

MONTANA has made an appropriation of \$5,000 to facilitate the exhibition of Montana products at the Centennial Exposition of 1876.

Mineral Surveyor for this State, assisted by his friend Dr. Thiessen. They have been at work on this map for over two years. The latter mentioned gentleman is also busy preparing a work on the diseases of the skin.

CORRESPONDENCE.

A Miner's Opinion on Mining Laws.

EDITORS PRESS:—In your issue of the 24th of January, you invite discussion from the mining community about this Ward amendment to the mining bill of May 10th, 1872. I am not quite certain that this is the last amendment to that bill; I used to keep track of them all, but have given up discouraged and disgusted. Sometime when they are done with making amendments to the mining bill, I shall want you to send me these laws, but there is no use spending money for them at present. There are so many representatives in Congress that want to get their names up that we miners (who are helpless anyhow) will have to gain and bear these showers of amendments trusting to the justice and integrity of the Executive to put his veto on all such impracticable bills. Who this man Ward is I don't know, politics not being my forte; this much I do know, that if he is an honest, well-meaning man, he don't know from personal observation anything about the subject he is treating of; if he is serving base purposes of other unscrupulous parties knowingly to himself, his nearer acquaintance can't be desirable to the producing portion of the community.

We hope, and trust there are a sufficient number of practical men in Congress to prevent such men as Mr. Ward, either through ignorance of facts in the premises, or through their insane desire for notoriety, to commit such a palpable public injury as to depopulate, in a great measure, by legislation, many of our mining camps, put a stop to further prospecting and development of our unknown mineral resources. Now, if this amendment should pass as it now stands it will really amount to that much. It will cause serious injury not only to the poor miner but also to the community at large—farmers, merchants and others will feel the weight of it. Mining companies already in operation will have a dearth of labor, and often be obliged to send to other places for workmen to the serious injury of their operations. They might think that capital will do the prospecting. Well, that may be so in a measure, if they don't get tired of it too soon, but even so as you say, they won't buy a "pig in a bag." The *Chronicle* is advocating the idea of extending the time to two years, but that won't do either, it is only keeping the blister on a little longer. It will prevent poor men, and for that matter sensible rich men too, from going into heavy prospecting, which in a majority of cases becomes necessary in order to find out whether they have got a mine or not. Ten dollars an acre is not unfair for mining ground, a person don't want many acres; anyhow, at least the present size of a mining claim is about right as to maximum, whoever can't pay for that much allow him to take less if you please, but if so, in order to make it fair to all parties, and to guard against "schenanigan" on the part of the patentees, compel them to include a certain amount of ground on each side of the center of the lode as to minimum.

In surveying claims a line should first be run from the point of discovery and notice following the center of the lode, to the two ends; perpendiculars on this line will strike the side lines, and if done correctly must of course prove accurate. This mode would be in strict conformity with the law, will add no extra labor for the surveyor, and will be found more comprehensive to the holder.

The sticking point about obtaining a patent is the amount of money it costs to obtain it, for poor folk particularly, where they are still only prospecting. There is surveyor's mileage, together with his other, at present, lawful charges, which, if not exorbitant, are at least so high that a poor prospector can't pay them, and, consequently, what? Is that man to be considered ineligible to hold his claim, for which he may have spent years of hard toil and endured privations, and upon which he has worked faithfully, under the former fair representation of the United States Government? Is this government, because it has the power, going to take away from him or them the sacred rights embodied in their former promises, enactments and laws? I think not; I think we are not going to be degraded as low as that. I have seen a picture of a woman who held the emblem of justice in one hand, and in the other she held an open book, on the leaves of which, in broad, plain letters, was written the word "Constitution." Now, if Constitution and Justice walk together, I say this bill of that man Ward is unconstitutional with a vengeance.

I have been looking at the picture of that woman again, and I presume she is meant to represent the blind goddess; but she is hoodwinked. Is there any need of a bandage over a blind person's eyes? Men will, as you and I know well enough, prospect for years in one mine, just as they are able to work. When they get "broke," they will go and hire out to others, if they can, to replenish funds for another start, always in hopes that eventually pay-day will come to remunerate them for their toils and hardships. Alack and alas, how often have we seen these hopes die in fruition, after strong men have spent their best years in vain! Mr. Editor, they say a rat even will fight, if he gets cornered. I wonder if it ever got into the

sagacious heads of some of those wise men in the East that miners even might get cornered and be forced to defend themselves, and fight for the rights and privileges under which they have already obtained constructive title to their mines. Do they expect good, sensible American citizens to stand tamely by and see themselves "robbed" of the fruits of hard toil and labor, just because they are unable to comply with unreasonable demands for more money through such infamous legislation; or do they mean to drive us out of the country, so they can have it all to themselves? They have perhaps no idea that it might cost Uncle Sam more to enforce this bill as it stands than the nation will benefit by it, providing there is not some measure taken in connection with any such bill so that a poor man can obtain his patent as well as the wealthy one.

Most everybody would like to obtain a patent or some kind of certain, confirmed title to their claims, could it be done within their means. Why don't the government appoint some special surveyors to go around from one district to another and survey claims for a fair remuneration above expenses, say twenty dollars per claim, or even less, if possible. Tax the mines thereafter according to their intrinsic value, products or otherwise, but make the tax on the poor prospector as light as possible. The original Mining Bill was pretty fair and does credit to its originator. Some modification might be necessary, but it should be proposed by parties conversant with the subject, by such as Jones or Kemble from this State for instance; they both possess the confidence and esteem of the people, besides they are known to be versed in mining matters. What can this Chicago man know anyhow? Commissioner Drummond, I believe, places a fair and honest construction upon the mining bill; at least I have not seen anything to the contrary. He is generally spoken well of in the mining camps. Of course he can't please everybody; that would be impossible, as his decisions must be adverse to somebody. It is almost amusing, I should say preposterous, to read the figures of some of these smarties, about how the sale of the mineral lands of the United States is going to be made to liquidate the public debt. Well, it is to be laid to their ignorance we will say. I feel pretty confident this Ward bill will not pass, it is too glaring a monstrosity. I don't think the Government wants to keep our mineral resources from being developed. It is the poor adventurer who finds new districts by wandering over these uninhabitable deserts, often suffering from hunger, cold and thirst. This State, even, still contains far more mines than have been found, and is a fair field for prospectors, providing they have not to buy a "pig in a bag." Pardon me for giving you the trouble of reading these rambling remarks, but you have yourself to blame by inviting it. In appreciation of your good-will towards miners, I hereby send you \$4 for a year's subscription for the PRESS. All miners ought to read the PRESS anyhow, as it gives a great deal of useful information difficult to obtain otherwise. H. SCHULLEN.

Spruce Mountain, Elko Co., Nevada.

Hydraulic and Lode Mining.

EDITORS PRESS:—It is a fact known only to well informed miners on this coast that our hydraulic mines are only in their infancy—just beginning to be prospected. None of them are daily heralded in the stock market to be "bullied" or "beared" on the street, or in the Board to suit the "vain tricks and dark ways" of stock manipulators. Those owning them are satisfied with their investments, their dividends, and future prospects. Those purchasing and developing them have gone into no blind speculation, whereby the work of a crew of men for a week or a month would disclose the fact that there was not a mine; and then from month to month, and year to year, levy assessments to hunt for one, by which means the unsuspecting are fleeced to keep up well furnished offices and a well organized band of high-salaried officials.

Three-fourths of the lode mines on this side of the Rocky Mountains were never worth the name of a mine—have never paid a dividend, and never will. A discovery is made of a hauler, or seam of quartz, between the rocks at or near the surface—rich often, in gold or silver—it dazzles and bewilders the gain-loving mind—everybody rushes in and takes stock at fabulous prices, not knowing whether the seam or bonder extends ten or a thousand feet deep. An organization is effected by the election of three or five trustees at high salaries, a high-toned office with luxurious furniture is rented somewhere in the vicinity of California and Montgomery streets. A clerk or secretary is there during office hours—the trustees drop in almost daily—Sundays excepted, to enjoy quietly their Havanas, and rack their over-worked brains in figuring up the amount of assessments necessary from month to month to enable the trustees, aforesaid, to pay themselves their salaries, their office rent, fuel, stationery, and keep so many men at work at so much per day. And so it goes from month to month, and year to year—the stockholders coming "down with the dust, in the vain hope to save what they have already expended; or, on the encouraging report of the gentlemanly superintendent, who 'shows plainly' on paper—that there are 'splendid indications ahead.' Had the money that has been foolishly expended on this kind of mining

been invested in hydraulic mining—if I could not pave your streets with gold—I could insure that your banks would have plenty of money to loan at seven or eight per cent. per annum; instead of one to one and a quarter per month, "interest payable monthly."

Let any man with a practical eye travel through our gravel ranges from Trinity to El Dorado, see the territories of gold-bearing gravel waiting to be washed away by the waters in the streams on either hand, and the golden nuggets swelling the commercial arteries of the world; building cities and manufactories, cultivating the hundreds of thousands of unbroken acres, and rearing homes of happiness and palatial magnificence from where the waves leap against the shore to away up the sides of the Sierras, and he will be astonished to see how this age has gone mad, in a blind hunt for the imaginary, when the real was so plain before them. With a hydraulic mining experience of more than twenty years, I am not able to call to mind a single failure when conducted under the system of high pressure with approved nozzles. To invest in a gravel mine is as plain as to buy a lot in your city—everything is in sight—you can measure its width, depth and length. You can within a fraction tell the number of cubic feet or yards it contains; after a cheap test, you can tell within a few cents how much it will pay per cubic yard; you can closely estimate the cost of separating the gold from the earth, in fact, you can measure it like a pile of lumber and tell how much it will pay per thousand feet.

Now, if hydraulic miners would from time to time give statements to the press of the number of cubic yards of earth that they wash from one clean-up to another; the gross yield per cubic yard, and also the cost in water, labor, etc., per cubic yard, and the net products per cubic yard; they would not only create a fund of valuable information for themselves but assist each other and benefit mankind in the development of mines that would yield handsome dividends instead of levying ruinous assessments. Thousands of acres wait development.

HYDRAULIC MINER.

That Mining Bill Again.

EDITORS PRESS:—In your issue of Jan. 24th, I notice editorial comments on the provisions of the new mining bill lately introduced in congress by J. D. Ward, of Chicago.

It is not necessary to state here the objectionable features of the bill. They are or soon will be, well known to the whole mining community of the Pacific slope. Should it become a law for one year only, the country would not recover from its effects in the next ten. It is difficult for us to form any conception of its objects. It benefits no particular class, not even the capitalists. For they never precede the prospector, and only become mine owners by the right of purchase. As a law it will

Strike a Fatal Blow

At the interests of that large class of enterprising industrious miners who spend the half of the year in working for wages that, they may prospect or work on their own mines the remaining half. It is their fearless energy and enterprise that have in the last ten years opened up all that vast region from the eastern slope of the Rocky Mountains to the shores of the Pacific Ocean, and made the world acquainted with the unparalleled mineral resources of more than one million of square miles of territory, which, but for them, would still be a *terra incognita*. Should this bill become a law it will affect these men as a class, far more than any other, as it in reality takes away all their heretofore acquired rights to mining property, thus at one blow robbing them of the fruits of years of patient toil, for not one in ten of them is able, to comply with its provisions. The result is easily anticipated; thousands of them will abandon the business altogether for some other that offers greater inducements, thereby partially depopulating the already sparsely settled districts of the mineral States and Territories.

Cost of Mineral and Agricultural Lands.

The miners as a class are satisfied with the law of 1872, although it unjustly discriminates against them as compared with agriculturists. The total cost of agricultural lands is less than \$2 per acre; let us see how this compares with the cost of mineral lands, and for a fair example we will take the Eureka Land District, comprising the counties of Lander, Eureka, White Pine and (I believe) Elko also, in the State of Nevada. From the passage of the first mining law of Congress to the present time there have been 240 applications made for U. S. patents to mineral lodes. The average area of each survey is about 6 acres. The lowest cost of any patent under the new law is \$220; the highest under the old law was \$300; the average is about \$260, or \$43.33 per acre. To this we may add the \$500 improvements required by law, amounting to \$83.33 per acre or an actual outlay of \$126.66 per acre before the miner can obtain a title to his mine, and all this expenditure is not really so much added value to the property. Of all the mines in the above district only seven have paid more than the expenses of working; and not over fifty have been self-sustaining. Thus one hundred and eighty-three have cost their owners by law \$139,080, and returned nothing. But this is not the whole showing of expenses without returns. A number of them have had sums spent upon them varying in amount from \$20,000 to \$350,000; or, perhaps, about \$1,500,000 in the aggregate. How does that

Compare with Agricultural Lands?

But the discrepancy does not stop here. Every dollar expended on the farm gives a return; either in the added value of the improvements, or in crops that go to the support of the farmer and his family. Not so with the mine. It often requires years of patient toil, and a large outlay of money to make it profitable; and, in many cases, disappoints after all. Its ores may be rich in valuable metals, but it requires costly mills or furnaces to convert it into marketable bullion. And, even after all this trouble and outlay of money, the ores may prove refractory, and resist every effort to convert them into a marketable commodity; but the farmer's grain can always be cheaply converted to flour. This is no fancy sketch, but actual fact, as hundreds of deserted districts, thousands of abandoned mines, and numbers of decaying and deserted mills and furnaces can fully attest. But then the question may be asked: "What induces the miner to spend his time and money in so unprofitable a business?" The answer is plain: the merit of splendid successes is the *ignis fatuus* that lures him on; or, how does he know but he may be the next lucky one, and find Crown Points or Belchers?

All the actual paying mines in the State of Nevada both past and present scarcely number a score even though the product of the State be \$35,000,000 annually. A great many more will doubtless pay with cheaper transportation and cheap and improved methods of reduction for the ores, but until that time comes, the miner must wait with what patience he can. He will be fortunate indeed if the wise Solons of the East do not legislate him out of the country and give it over once more to the wandering tribes of Indians. There are fertile valleys in California and rich prairie lands in the West, that will surely reward his toil with subsistence. It seems to be a pet idea with some of the pseudo-political economists of the East that the mines of the Pacific slope should in some way be made to pay the national debt. They had better come out and try the business themselves for a few years. They will be fortunate indeed if they are able to pay their own debts after a fair trial, let alone the nation's. I would suggest that they turn their attention to the fruit and pea-nut stands of the eastern cities; perhaps by a judicious system of taxation they would realize as much revenue as they would be likely to get from the sale of the few paying mines on the Pacific slope; or, perhaps, they had better make a study of the laws of those countries that practically give the mines on the public domain to any one who will work them and make their wealth available as a medium of commerce. They might learn a useful lesson from their superior political economy.

Treasure City, Feb. 2d, 1874.

Stickeen and Cassiar.

The following items concerning the above mines, which may be of interest to the public, especially to those who have caught the "gold fever," we obtain from the *Victoria Colonist* of a recent date:

A large number of miners—probably 100—are preparing to leave by the *Oler* for Cassiar. Twenty miners are expected from Portland on the *California*. Both steamers will have full cargoes of goods for the new mines.

The number of toboggans and snowshoes now being made in this city by Cassiar-bound miners is very large. Dogs, too, are being trained for the purpose of drawing sleds over the ice and snow. Yesterday we met a party of three miners, in the suburbs, each dragging a toboggan heavily weighted with stones to represent provisions. They were accustoming themselves to dragging heavy loads, with a view to hauling their "grub" and tools into the mines before the soft weather shall have set in.

We have a word or two of caution for miners who contemplate making an early start for the new diggings. They are going too soon. They will find the river frozen, the cold intense, the snow deep, and suffering and privation of every kind will assail them at every step of their journey. There will be no comfortable cabins to receive them on their arrival at the Forks, and then they must sit down and consume their little stock of provisions until travel into this diggings becomes safe, when, even if they have preserved their health, the purchase of new supplies, at enhanced rates, will be necessary before they can venture to start for the mines. For these and many other considerations, we have no hesitation in saying that the miners are going too soon, and we fear that many will have to regret their imprudence.

COPPER.—The *Foothill Tidings*, says: A few miles below here in the direction of Wheatland lies a belt of copper veins which twelve or fourteen years ago created quite a furor in the mining world of California. For several years past the copper fever has run low and most of these old claims were abandoned or had passed into other hands. Some time ago Mr. G. F. Deetken, long a famous worker of sulphurets in this city, took charge of the business for a San Francisco company and erected smelting works at Spenceville, in the face of the discouraging fact that in several other places in California such trial has been made without success. We are glad to learn that this enterprise is likely to be crowned with complete success; that a few days since Mr. Deetken shipped to San Francisco a ton and a half of pure copper, the first of a series of shipments which will add greatly to the business of this section and bring out many old claims now unproductive.

MECHANICAL PROGRESS.

Little Engines.

There is no difficulty in making a small steam engine. Such a device has commonly been the first *chef d'œuvre* of the ambitious machinist's apprentice, and a California mechanic at a recent fair in San Francisco, mounted upon the top of a post a motor with a three-quarter inch cylinder, made from the first silver smelted in Nevada. We speak now of bona fide engines, those with slide valves and other essentials, not of the small toys that of late have been sold for \$1, and proved how interesting for amusement a scientific and useful fact may be. But there is no good reason why a little engine of some kind should not be found a paying article in every household. In cities it should drive sewing-machines, and in rural regions operate the churn and the wood-saw.

There is, indeed, much more attention now given to this matter than was the case a few years since. Not long ago the French technical journals described a petroleum furnace with a self-adjusting wick, giving a uniform heat to a small tubular boiler which fed steam to a small steam-engine. One of the exhibitors at the American Institute Fair has introduced a machine on a somewhat similar plan for sewing-machines. In this, petroleum burners heat a vertical boiler, and an oscillating cylinder connects its piston-rod direct to a crank on the shaft of a machine. Doubtless many modifications of the principle may be made, and the present low price of petroleum would seem to encourage the use of this fuel for small motive power. But the objections to steam are manifest, and although not insuperable, are of sufficient weight to render it well worth while to consider whether some other means cannot be used in its stead for giving the moderate power now a decided desideratum for many purposes.

In this the employment of illuminating gas, mingled with atmospheric air, has attracted attention for the third of a century past. For several reasons, perhaps among others the accumulation of sooty deposits from imperfect combustion, this has not met with much favor. Possibly the cheapness with which, it is alleged, hydrogen gas may be manufactured by novel processes, may supply a superior substitute for carburretted hydrogen, and Brown's gas engine of forty years ago (dependent for its operation upon the explosion of mixed hydrogen and air, and proved a failure on a grand scale in pumping and boat propulsion) be revived again with more of practical utility, but less of sanguine notoriety than of old.

It has been claimed by manufacturers of hot-air engines that a calorific motor of small size would "fill the bill" in the matter under consideration. But if we may judge of the inordinate sizes in proportion to the work done, of those used in coffee and spice warehouses for grinding in sight of the public, the assertion referred to may well be doubted. The safety of this motor is a strong recommendation for it, and it is to be regretted that no one has yet seen fit to test the capabilities of a hot-air engine occupying a space of, say one cubic foot, and heated by a petroleum flame.

There remains, in addition to the methods mentioned above, the use of electricity as a motive power; a matter debated with much ridicule on the part of those adverse to its use and with much earnestness on that of those who believe in its final success. On the one hand the cost of running an electric motor and the failure of many an apparently promising project are urged as unanswerable arguments against the feasibility of electricity for any such function; on the other, it may be pointed out that long ago, Prof. Page ran a heavy locomotive at nine miles an hour with mechanism imperfectly put together, and that there is no limit to the possibilities of applied science and practical mechanics. Between the two the impartial observer may be justified in saying, "wait and see;" but none can deny that a light motor is one of the needs of the times, and that, consequently, it is the duty of some one to produce it.—*Newark Manufacturer.*

IMPROVED WOOD FENCE.—The stakes are used in pairs, set at such an inclination toward each other that they intersect or cross, and are placed at the usual distance apart to form a panel of fence. A rider is supported in the angles formed by the intersection, and an upright is placed centrally between each pair of stakes, with a rider extending across the top ends thereof. Braces are attached to the stakes at one end, while the other end rests beneath the lower angle of the latter, on the rider. The uprights are connected with the stakes by elats, and placed at an angle of fifteen degrees with the surface of the ground. Rails rest on these slats, and their ends lap past each other by placing them on opposite sides of the uprights. The fence is said to be straight, and proof against unruly stock, as well as high winds.

HINGED FIRE-LIGHTERS.—In the matter of fire-lighters, it might be thought that there was no room for "improvement," but an ingenious gentleman seems to think that if they had "hinges," above all things it would render them more handy. We fail, however, to perceive the utility of the appendage, which seems to us to be allied to the fifth wheel of a coach.—*Iron.*

Another Type Writing Machine.

A patent has recently been issued to Mr. John Galloway, of New York for an improved writing machine, which the inventor describes as follows: There is a roller, of sufficient size to receive a sheet of the paper to be used, and covered with cloth. This is mounted on a horizontal shaft which revolves in bearings attached to the frame. The paper, in connection with the colored paper or cloth from which the color is obtained for the impression, is rolled around the roller, and its edges are secured by a clamp. To the inner end of the roller is attached a spiral thread, which works between the pins of a shaft, so that the roller may be moved longitudinally upon its shaft at the same time that it is carried around thereby. By suitable means, the teeth of the shaft may be turned down out of gear with the thread, so that the roller may be pushed back at once, when required. By suitable construction the roller is rotated by the upward movement of the forward parts of the frames, the downward movement of said parts raising a push pawl one tooth. A pawl which is pivoted to the frame, has its engaging end resting against the teeth of the wheel, to prevent said wheel from being turned back by the friction of the pawl as it is raised. A long block or hand piece is perforated longitudinally to receive a slide upon the forward bar of the movable frame. Upon the inner side of the forward end of the sliding block is formed an arm which projects through a slot in a plate, the ends of which are secured to the side bars of the frame. In the plate, at the upper and lower edges of said slot, are formed notches, and the free end of the arm is so formed that it may fit into the upper or lower notches, according as it is inclined upward or downward. Upon the top of the slotted part of the plate are formed the alphabet, the nine digits, a comma and a period, which characters are arranged in two rows, one corresponding with the upper and the other with the lower row of notches. Upon the lower side of the sliding block are formed two rows of raised type corresponding with the characters, and which project at such an inclination, that when the arm is in the notch of either the upper or lower row of notches, the corresponding row of types will be in proper position for making the impression. In using the machine, the paper is placed upon the roller and the block is grasped with the hand, and is moved to bring the arm successively into the notches corresponding to the letters of the word to be formed upon the paper. As the arm is brought into each notch, the block is forced down, and the letter is printed upon the paper. At the end of each word the roller is caused to rotate twice the usual distance, and thus forms a space between the words.

Safety Hoisting Apparatus.

English patentees claim certain improvements in apparatus to be used with cages for mines and shafts, for the prevention of accidents through overwinding or breakage of the winding rope. These consist in attaching two ordinary diagonal suspension chains to the winding rope or chain, and from these suspending the cage. The supporting catches to which the diagonal chains are attached are not permanently secured to the cage, but are held vertically in position at each side of the cage by means of latches turning upon horizontal pins, each latch having a handle or tail end projecting horizontally when in ordinary use. The guides between which the cage travels terminate at a suitable height above the mouth of the pit, and are furnished with strong bolts, which project in such manner as to catch and depress the tail ends or handles of the latches, should the cage be overwound or raised too high. The catches are thereby set free from the cage, and pass away with the winding rope. In departing, each catch lifts into a horizontal position an arm, which is hinged at its upper end to the cage, and which, when it is in its ordinary vertical position, transmits the weight of the cage to the supporting catch. Each hinged arm has a stop to prevent it from rising above the horizontal line. Upon the said cage attempting to fall after the release of the supporting catches, the horizontal hinged arms catch upon the top of the vertical guides and support the cage in safety. Each of the aforesaid supporting catches is made in two pieces, the upper piece being hinged to the lower piece. The upper piece has an external hook or catch at its upper end, which, when the rope breaks, is forced by a spring into gear with ratchet shaped teeth formed upon the inner face of each guide bar, but as long as the rope or chain is unbroken, and the cage hangs therefrom, the tension of the diagonal suspension chains counteracts the force of the spring, and holds the upper catches out of action.

COTTON SEED PLANTER.—In view of the interest now being taken in cotton raising in this State, all implements connected with the growing of that crop should be studied. A new planting machine is claimed to be an improvement in the class of planters having a furrow opening plow and covering devices arranged, respectively, in front and rear of a hopper, from which the seed is centrally discharged as the machine advances. The improvement relates to the arrangement of plows or shovels in rear of a centrally discharging hopper, whereby one distributes or disperses the seed after being deposited in the furrow, and the others cover it.

SCIENTIFIC PROGRESS.

Can Electricity be Profitably Employed as a Source of Power?

The *Technologist* thinks not, and offers an entirely new line of argument to support its belief. If our esteemed contemporary will satisfy us that frictional electricity is more cheaply produced than that resulting from chemical decomposition, we will accept the inference. But we think that is, to say the least, not proved. The *Technologist* says:

There was recently on exhibition in one of our industrial expositions a series of pumps, worked by exhaust steam, over which was placed the startling announcement, that, by means of them, water might be raised to a given height in quantity sufficient to drive a water-wheel which would give out more power than the steam-engine itself! The placard was well calculated to attract attention, but then nobody believed the statement printed on it, for the simple reason that no engine, far less the exhaust steam from one, could ever pump up water enough to drive a wheel which would give out half the amount of power of the original motor. The waste in pumping and the loss caused by want of efficiency in the water-wheel would be sure to consume the other half. Now it happens curiously enough that there are in common use two methods for producing dynamic electricity—one being the voltaic battery and the other any form of mechanical power. In regard to the latter, it is evident that the same principle holds true in regard to it that is at the same time true in regard to the water-wheel and steam-engine above mentioned. If electricity, which has been produced by the agency of mechanical power, be applied to the driving of an electro-motor, the latter can never be made to give out as much power as has been exerted by the engine employed to produce that electricity. In other words, no one could be found so foolish as to employ a steam-engine to produce electricity for the purpose of operating an electro-motor intended to drive machinery. It would evidently be vastly more economical to drive the machinery by means of the engine itself, without the intervention of any complicated apparatus.

This proposition is so self-evident that it requires no elaborate demonstration; but from it follows the very obvious conclusion—that, if by means of the steam-engine we can produce electricity more cheaply than we can by the voltaic battery, then it is evident that the battery can not compete with the engine, as a source of power, no matter how perfect may be the electro-motor through which the energy derived from the battery is applied. Hitherto, it has been claimed that the only difficulty in the way of applying electricity as a motive power, consists in the absence of a properly constructed electro-motor; but if it can be proved that electricity can be produced more cheaply by means of steam than by the consumption of zinc, then it is clear that even a perfect motor—that is to say, one that utilizes all the electrical energy, and converts it into mechanical power—can not enable the battery to compete with steam.

Here, then, is a crucial test which is easily applied. And we believe that the results already attained do not leave the question in any doubt. In the case of the electro-deposition of metals, as well as the production of the electric light—two instances in which the comparison between the engine and the battery may be made with great accuracy—it has been found that the engine is the most economical. *A fortiori*, it should be far more economical as a source of mechanical power.

IRON IN PLANTS.—So far as investigations have shown, iron forms no essential part of the plant or animal, yet without it all growth and assimilation cease. If seeds are placed on a little cotton-wool in a solution containing all that is essential to plant growth, with the exception of iron, they will sprout and grow until the iron contained in the seed itself is exhausted, the plant then quickly bleaches and ceases to grow. If a little phosphate of iron, which is almost totally insoluble, is added to the solution, and occasionally stirred up so that it may be kept in suspension and thus come in contact with the root, the plant quickly revives and continues its growth. Iron is an essential constituent of chlorophyll, the green coloring matter of leaves. Although found in all plants, and constituting an essential part of their food, it has never been thought necessary to supply it to them artificially, all soils being supposed to contain sufficient for their wants. But no one can have failed to observe the greater luxuriance of vegetation on the strong iron soils derived from the old red sandstone than on those granite soils which are comparatively free from it.—*Journal of Chemistry.*

Still another chemist, Mr. Wodermann, of England, claims a new process of producing aluminum without using metallic sodium or potassium. He also proposes a method of direct production of caustic soda from sodic chloride. Why do these wonderful discoveries never get beyond the newspaper item stage?

Meyer deduces, from long-continued experiments, 95.8 as the atomic weight of molybdenum.

The Philosophy of the Sand Blast.

At first sight, the cutting of a diamond or other hard substance, by another so much softer as sand is, seems flatly contradictory to common experience. Still, to any one who has ever fired a rifle ball against a rock, the fact that a flying soft body will bruise or crush a harder one is neither surprising nor new. The possible perforation of a pine board by a tallow candle, fired from a musket, is an illustration of the same fact, familiar to every school-boy. In the sand blast, however, the effect seen is so manifestly disproportionate to the momentum of the individual particles that the explanation usually given in the grosser cases fails to hold good. Grains of sand, of very unequal size, appear to do precisely the same work when moving at the same rate, thus directly contradicting what has hitherto been an unquestioned law of impact.

Whence arises the discrepancy between what is and what might be expected? To answer this question, an English investigator has reconsidered the laws of impact, and finds that one of great significance and importance has heretofore been overlooked. It is this: At the moment of first contact, the pressure between impinging bodies is independent of their size.

This law has been undetected heretofore, simply because the laws of impact have been considered mainly with reference to the centers of gravity of the bodies, while little or no attention has been paid to the points of impact and what goes on there between the instant of first contact and the time when the center of gravity is changed. Even with the compact bodies, it takes time for the pressure to extend to the inner particles.

Hence, on the instant of impact, it is only those particles in contact which are affected, and the rest of the body might be removed without altering the effect. In other words, the effect of impact is independent of the quantity of matter behind the particles which actually impinge.

That the effect of the sand blast is—as this law indicates—a hattering, not a grinding action, is clearly shown by the microscope. A polished glass surface, that has been exposed for an instant to the blast, is spotted with points from which scales of fractured glass have been broken away in irregular directions. Each spot appeared as if a pellet of glass had been driven in by the collision, and the wedge-like action thus set up had driven away the surrounding glass. The polariscope confirms this inference. When thus tested, each spot shows a colored halo, proving that the surface of the glass is under strain.—*Sc. Am.*

THE DETECTION OF DEATH.—The late Marquis d'Orche, one of whose friends was buried alive, left a sum of 20,000 francs to the French Academy of Medicine, to be given to the inventor of a simple process of ascertaining when death has really occurred, and a further sum of 5,000 francs to be awarded to the discoverer of a scientific method of verifying death. Altogether 102 essays were sent in for adjudication. Most of the papers contained such absurd suggestions that the list was practically limited to 32 competitors. The large prize was not awarded, but the 5,000 francs were divided between four competitors. No new facts, likely to enlarge the domain of forensic medicine, have been elucidated by these investigations.—*Sc. Am.*

A mining engineer, P. De Royster Ricketts, of New York, has introduced improved processes and apparatus for effecting the separation of tin from tinners' waste. The scrap tin or tinners' clippings are first to be treated in hydrochloric acid of the strength of 20 deg. Beaumé, until the bath becomes exhausted; and then the gradual addition is made, to the bath, of nitric acid, of the strength of 40 deg. Beaumé, in conjunction with chloride of potash, either pulverized or in the condition of a concentrated solution. Or the tinners' waste is to be treated with hydrochloric acid until about two-thirds of the tin is dissolved therefrom, when they are to be introduced into a bath of mingled hydrochloric and nitric acids and chloride of potash, until the remainder of the tin is eliminated in solution.

EXPLOSION OF CHLORINE AND HYDROGEN.—A correspondent of *Nature* gives the following simple method of showing the explosion of chlorine and hydrogen by artificial light: "Equal volumes of the two gases, prepared separately by the usual methods, were mixed in a stout test tube and confined by a greased cork. This was placed upright on a little wooden stand, and kept in its place by a brass clip. About an inch of magnesium was suspended in a small tin shade by means of a wire clip. The magnesium being placed near the tube and lighted, the gases united with a report, jerking the cork to the ceiling, but in no case breaking the tube."

GARDENERS have long affirmed that the moon's rays give great activity to the growth of mushrooms. M. Charbonnier, of Paris, states that he has observed in his aquaria a very remarkable growth of cryptogamous vegetation under the influence of the light of the full moon.

The cultivation of science spreads steadily. A scientific society has recently been established at Buenos Ayres, Mr. A. Luise Huergo for its first president. According to their programme, the members have arranged for carrying out several branches of original research.

Exports of Gold and Silver for 1873.

The following table shows the description of treasure exported from this Coast in 1873:

	BARRE.	COIN.	DOLLARS.
January.....	\$198,684	\$ 227,412	\$1,680
February.....	69,964	1,465,329	3,290
March.....	129,237	1,776,302	3,000
April.....	\$34,845	1,152,696	6,380
May.....	129,429	229,766	4,920
June.....	308,664	285,936	3,680
July.....	385,687	218,768	2,550
August.....	836,707	200,686	2,920
September.....	34,174	788,162	2,050
October.....	43,168	1,324,439	9,400
November.....	329,938	1,182,696	36,800
December.....	26,344	363,902	14,730
Totals.....	\$2,889,871	\$9,077,492	\$78,445

New Incorporations.

The following company has filed certificates of incorporation in the County Clerk's office, San Francisco, Cal., Feb. 14:

LORD BYRON MINING AND SHIPPING CO.,—Feb. 14.
 Object: To freight and ship high-grade silver-bearing ore from Fort Mohave and other places on the Colorado river to San Francisco, to sell the ore or reduce it to bullion, or to a practical commercial form. It is also proposed to work mines in Arizona and erect reduction works, to trade in merchandise and other products. Trustees—Wm. H. Cummings, Wm. B. Ever, D. C. Carson, Leander Ransom and J. B. Whitcomb. Capital stock, \$3,100,000, in 31,000 shares.

Meetings and Elections.

EMERALD HILL M. Co.,—Jan. 13. Trustees—Fenn. K. Horton, C. P. Hurley, John A. McGlynn, John M. Johnson, George Secretary, John B. Oliver, Henry A. Fox, B. D. Murphy and T. W. Colburn. The Board organized at the election of Penn. B. Horton, President; John M. Johnson, Treasurer; F. Mulge, Secretary, and D. C. McGlynn, Superintendent.

SAN FRANCISCO MICROSCOPICAL SOCIETY.—President—H. G. Hanks; Vice-President—Dr. A. B. Stone; Recording Secretary, C. Mason Kline; Corresponding Secretary, H. C. Hale; Treasurer, F. P. Bellman.

JUTROE M. Co.,—Feb. 16. Directors—A. P. Minear, J. T. Hill, E. Hestres, J. Clem. Uhler and J. P. Jackson. At the commencement of the year there was only \$8 in the treasury. Five assessments have been collected amounting to \$147,000, and about \$14,000 has been received for bullion. The total receipts have been \$168,906, and the disbursements \$149,037, leaving a profit on hand. Other assets consist of supplies valued at \$7,327. The liabilities amount to only \$441.

said to be rich. The Yellow Jacket has let a contract to sink the main shaft 100 ft. deeper. The contractors have commenced. The Trus Blue, a recently incorporated company hailing from Stockton, have also commenced work on their mine near Camp Flores. Miller & Co., Anderson Flat, are ready to commence sinking. The Woodhouse is also making vigorous preparations. Considerable pay ore remains on the dumps of different mines until the roads harden.

DISCOVERY.—Messrs. Donn & Brown have lately discovered a quartz ledge, near the Good Hope mine at Mosquito, that prospects well.

WHISKEY HILL.—A recent clean-up in the Whiskey Hill Tunnel Mining Company's claim near Jenny Lind, after a run of only thirty days yielded \$5,000.

SAN BRUNO.—The lowest tunnel in the San Bruno mine at Mosquito has been run a distance of 40 ft. in the finest chert of pay ore yet developed in the district. The ledge is 26 inches thick in the face of the tunnel, and the entire vein shows free gold. Stopping will be commenced next Monday.

EVERLASTING MINE.—*Citizen*, Feb. 14: Work at this mine progresses favorably. The main shaft is down over 270 ft., and the company are now engaged in running a drift, 80 ft. from the surface, with the hope of striking the lead where the former proprietor found good rock at a depth of 45 ft. They have now some 35 ft. to run before expecting to reach the lead and the rock is very hard and solid.

EL DORADO COUNTY.

STRUCK IT.—*Mountain Democrat*, Feb. 14th: The Oregon Hill Mining Co., a little distance south of town, at a depth of 300 feet, have this week struck the ledge, which is between three and four feet in width, is solid, and looks remarkably well. Those familiar with the class of rock developed are confident that it will pay from fifteen to twenty dollars per ton. We are glad to note the present fine prospects of the company, not only on personal account, but for the interest of the whole community, as it shows there is good pay in our ledges and a full and rich reward for those who have the pluck and means to go deep down below the surface. With the exception of the old Pacific, the Oregon Hill Mining Co., we believe, are deeper on their ledge than any other company in this vicinity.

REMARKABLE YIELD.—We mentioned last week that there was being crushed the rock taken from the shaft, sunk from the bottom of the tunnel in the Ida Mitchell mine. The new company had crushed all that came out of the shaft, quartz, talc, slates and every thing else, and that is what makes the yield remarkable, it being an ounce per ton. There are few mines that would yield this. Had the rock been sorted, as is generally done, and none worked but pure vein ore, the yield would without doubt have been at least double or three times as large.

ROSE.—The owners of the Rose mine have a hundred tons of rock ready for the mill, which will commence crushing the same on Monday next, weather permitting.

GEORGETOWN ITEMS.—Barklage, of Georgia Slido, uses between 700 and 800 inches of water daily at the Jones Hill mine. He uses a fifteen inch pipe and a "giant" with a four inch discharge orifice.

DOW & McCONNELL have tunneled into Mam-eluke hill to a distance of 800 ft. in search of a gravel deposit.

The Bryant brothers are also tunneling Mam-eluke hill, and they are now washing out pay dirt. The gravel deposits in that vicinity are supposed to be very extensive, and they are rich beyond doubt.

Bennett and Swift are rapidly deepening their cut. A transverse section of the cut shows a great number of parallel seams of decomposed quartz varying from one inch to a foot in width.

Mr. Altars is prospecting a ledge of asbestos which is full of gold bearing seams. This is a curiosity in the way of mining and more will be said regarding it as soon as the ledge is developed.

When Chas. Wentworth cuts into the hill 40 ft. further, he will have reached the seam that he seeks.

CINNABAR.—*Amador Ledger*, Feb. 14: The latest reports from the recent cinnabar discovery in El Dorado county are very favorable; as far as work has progressed 8 feet of ore was drifted through, which it is estimated, from tests made, will yield 10 per cent. After passing through the 8 ft. ledge, the workmen came to a "horse;" drifting through this, rich ore was found, of a foot or two in width. Pursuing the course of the drift, the workmen cut through another "horse," and came on to a vein of ore of remarkable richness, being two feet wide, and the weight and appearance of the ore will justify an estimate of 60 per cent. of quicksilver. There can now be no question as to the great value of the ore as far as developments have been made, and if the ore should prove abundant, as present appearances indicate it will, the discovery will prove of immense value.

NEVADA COUNTY.

KENTUCKY.—*Tidings*, Feb. 14: The stamps at this mill have been dropping some of late; enough to show that with more men at the breasts so as to furnish as much ore as the mill could use up fair, clean ups could be made and the expenses at least, of the mine and mill cleared. The situation of the mine is a bad one on account of water at this season of the year and the pump is not able to keep the

lower levels clear, so the work of drifting and taking out rock is confined to the 100-foot level.

PLACER COUNTY.

YANKEE JIM ITEMS.—*Cor. Argus*, Feb. 14: The Georgia Hill Mining Co. let off a highest on Saturday last, at two o'clock p. m., 310 kegs of powder were fired and proved a perfect success. It is estimated that 35,000 cubic yards of gravel was loosened. They will be ready to work in about ten days.

PLUMAS COUNTY.

A HUON ENTREPRENEUR.—*Notional*, Feb. 7: The Dutch Hill Co. are making arrangements for work on a canal, to bring the waters of Deer creek to their extensive mining claims at Dutch Hill. The undertaking is a large one, as it is necessary to have something like 40 miles of ditch and pipe, and they propose to construct it of a capacity, at the head, of 2,000 inches of water. This will insure them 1,000 inches at the claims. They already have a large lot of iron pipe on the way, and will commence work as soon as spring opens.

NAPA COUNTY.

QUICKSILVER.—*Cor. Register*, Feb. 14th: P. H. Lillie brought down 15 flasks of silver from the Sonoma mine on Monday. Charley McOrory brought down 14 on Saturday from the Missouri; showing that our mines are beginning to pay. Messrs. Lillie & Stratton have struck a rich prospect near the Great Western. They took over a load of tools and provisions on Wednesday.

SAN BERNARDINO.

GOON ORE.—*Guardian*, Samuel H. Baird, a proprietor in one of the recently discovered mines in Holcomb Valley, put in a blast 6 inches deep, 30 feet above the surface. The rock was white quartz; and from one of the chips brought in here an assay was made, averaging \$600 to the ton. Even in this rock, this high above the surface, free gold was plainly discernible. In one piece of rock, about three pounds in weight, a small particle of gold was lodged in the surface, as large as a small pea.

SISKIYOU COUNTY.

OAK BAR.—*Yreka Union*, Feb. 14th: Owing to the high water in the Klamath river, all the mining operations in the river claims at Oak Bar have ceased and the machinery has been all taken out of the different claims. During the period of high water the miners will prospect and work around in the gulches and small streams contiguous to Oak Bar. The country is very rich in that section, and we expect to hear of considerable gold being taken out.

TRINITY COUNTY.

MCGILLIVRAY DISTRICT.—*Journal*, Feb. 14: Jos. McGillivray is running both the McGillivray and Stoddard mines on Trinity river, to their full capacity. His Cañon Creek ditch furnishes a full supply of water for both claims, and bed rock is being stripped at an unprecedented rate. Several clean-ups have been made; and we are assured that these mines fully maintain their former reputation for richness.

CLEANING UP.—Some of the miners in the neighborhood of Junction City have lately made partial clean-ups. Heger & Haas realized more than \$500 from their under-currents and all are well satisfied with the results.

Nevada.

WASHOE DISTRICT.

OPHIR.—*Gold Hill News*, Feb. 14: The north cross-cut on the 1,300-ft. level is still pushed ahead, the face in fair grade ore. Sinking the winze from this level to connect with the up-raise from the 1,465-ft. level is making good headway, the bottom still in good ore. The up-raise from the 1,465 ft. level is also still in rich ore. The winze from the 1,465-ft. level to connect with the up-raise from the 1,700-ft. level has passed through the body of quartz and low grade ore into what appears to be a continuation of the west ore body, the ore in the bottom being of excellent quality, and gradually increasing in richness as a greater depth is attained. The main drift south on the 1,700-ft. level is being driven ahead to connect with the winze from the 1,465-ft. level, and thus ventilate the lower levels of the mine.

BELCHER.—Main incline down 98 ft. below the 1,400 ft. level, in hard blasting ground. The main drift north from the incline, on the 1,400-ft. level is in 62 feet, the face in very hard rock. The south drift, on the 1,100 level from the incline, is in 152 feet, and the main south drift from the incline on the 1,300-ft. level, is in a distance of 212 feet, the face in quartz of a very promising character. The south winze, on the 1,300-ft. level, is down 127 feet, the bottom in hard blasting rock. Preparations are rapidly being made for the opening of the 1,400-ft. level. Daily yield of ore, 525 tons. The ore steps throughout the mine are looking splendidly, and promise a rich yield for the future.

CROWN POINT.—The main south drift on the 1,500-ft. level is pushed vigorously ahead, the face showing ore of increasing richness. The flow of water from the face is gradually lessening. The north winze on the 1,400-ft. level is down 32 feet, making a vertical depth reached of 22 feet, the entire depth in very rich ore. Daily yield 400 tons of ore, mostly from 1,000, 1,200, and 1,300-foot levels.

LADY WASHINGTON.—The new shaft is down 184 feet, the bottom in soft picking ground, the sinking progressing at the rate of three feet a day.

SIERRA NEVADA.—Sinking the new shaft is progressing three feet per day. The ore breasts

are looking well and yielding the usual amount of milling ore. The mill is in fine condition and is kept steadily running, crushing ore from the mine.

CHOLLAS POTOSI.—Daily yield of ore, 40 tons, the assay value of which is \$32 per ton. The dumps are again all full, and should this present stormy weather continue, the extraction of ore will have to be discontinued until the roads will admit of getting the ore to the mills.

SOUTH COMSTOCK.—New shaft down 32 feet. It has passed through the hard quartz strata mentioned last week, and is now in a softer stratum of decomposed gypsium, etc.

INDEPENDENT AND OMEGA.—The shaft is down to a depth at which it is expected every day that a body of water will be tapped. The sinking is making good headway. The tunnel is cleaned out and repaired to the ledge, and a body of fine looking quartz has been opened, containing spots and streaks of ore that gives some excellent assays.

NEW YORK CONSOLIDATED.—The main shaft is down 480 ft., the entire bottom is a mixture of clay and quartz. The shaft in sinking the last 100 ft. has passed through ten different spots or streaks of quartz, the last found in the bottom assaying more than any heretofore encountered.

JULIA.—Two crosscuts east, on the 1,000-ft. level, have been started to prospect the ledge, which so far as the crosscuts have penetrated, shows a fine body of milling ore.

UTAH.—But little progress has been made with the main west drift on the 400-ft. level during the week on account of tapping and drawing the heavy body of water from the old upper works, and foul air encountered in the face of the drift.

EDGEMO.—The main west tunnel has passed through 90 ft. of vein matter, with no sign of west wall as yet.

GOULD & CONRY.—The main east drift on the 1,700-foot level is pushed steadily through the body of porphyry intervening between the east and west ore veins. The north drift on the 1,700-foot level is driven vigorously ahead, following the line of the west vein, the face in quartz of a very promising character. At the sixth station the old east drift has been cleaned out and repaired, and prospecting the ore vein again commenced.

OVERMAN.—Sinking the winze from the 1,000-foot level to connect with the main west drift on the 1,200-foot level is making steady headway, the bottom still in ore.

ROCK ISLAND.—Still sinking the winze, but progress is somewhat impeded by increase of water. It is down now about 25 feet and the bottom is in good looking quartz, some of which is milling ore.

LEO.—The vein matter is six feet in width, a good portion of which assays well.

SUCCESS.—Sinking the new shaft east of the hill is making rapid headway. The ore in the east drift on the 180-foot level of the little shaft in the cañon, still continues to show improvement in quality.

SCORPION.—Sinking the new large shaft for working this mine will be commenced about the 1st of March. The prospecting done in the old upper tunnel in 1861 showed some rich ore, and seems to guarantee the finding of a much larger body at a greater depth.

GLOBE CONSOLIDATED.—Sinking the main incline is making rapid progress, the rock in the bottom blasting finely.

CONSOLIDATED VIRGINIA.—Sinking the main shaft is making steady headway. It is now down 72 feet below the 1,300-foot level. Sinking the north winze on the 1,300-foot level has been resumed, the bottom still in good ore. The stopes and ore breasts on the 1,300, 1,200, 1,000-foot levels are looking splendidly throughout, and promise a rich yield for the future. Daily yield, 200 tons of ore, mostly from the 1,200-foot level.

HALE & NOACROSS.—The main south drift is in 42 feet from the incline, following the line of the ledge. Crosscut No. 2, from the main north drift on the 1,900-foot level, is in 38 feet, the face in hard blasting porphyry. Daily yield of ore, 40 tons.

BALTIMORE CONSOLIDATED.—The past week has been mostly spent in cutting out for the water tanks at the 640-foot level and making preparations for putting in the second lift pump.

IMPERIAL.—The south winze on the 700-foot level is down 63 feet in quartz of a very promising character. The north winze on the same level continues to show improvement.

KNICKERBOCKER.—The new hoisting machinery was all started up last Wednesday morning, everything working to the utmost perfection. Draining the water from the shaft has been commenced.

CALEDONIA.—The drain tunnel, to connect with the shaft at the 300-foot level, is pushed ahead from both ends.

DAYTON.—About fifty tons of ore are being shipped daily to the Woodworth mill on Carson river, notwithstanding the bad state of the roads.

SAVAGE.—The main west drift, on the 1,900-foot level, is still pushed steadily ahead, the face in hard blasting rock.

TYLER.—A south cross-cut has been started from the main west drift on the east side, and running parallel with the ledge.

YELLOW JACKET.—Sinking the main incline for the 1,600-ft. level is making good progress.

MINY.—The erection of the new hoisting machinery is making rapid headway.

DANEY.—Sinking the shaft is making good headway, the rock in the bottom working finely.

FAIRMOUNT.—Still driving the north drift from the main tunnel, following the line of the ledge, the face of the drift still in low grade ore.

KOSKUTH.—Still prospecting through the main west drift at the 200-ft. level.

BUCKEYE.—Sinking the main incline is making the usual good progress.

AMERICAN FLAT.—Nothing doing in the mine. Still waiting on the improvements being made in the Baltimore shaft.

WOODVILLE.—The raise above the 300-foot level is still in good ore.

SCRAO.—The mine is improv'g in appearance daily, the average rock encountered in the winze during the past week assaying \$20 per ton.

OCCIDENTAL.—The stormy weather still delays the erection of the new hoisting machinery.

CALIFORNIA.—Driving the main north drift from the 1,300-foot station of the Virginia Consolidated to make connection with the south drift from Ophir on the same level is making rapid progress.

PICTOR.—During the past two weeks the Superintendent has had his entire forces at work repairing the main tunnel in several places.

OWN POINT EXTENSION.—The new hoisting works, for the development of this mine, are fast being erected and put in position, but it will be a week or two yet before sinking in the shaft can be resumed.

SILVER HILL.—The new station at the 360-ft. level is opened, and a drift started for the ledge. The extraction of ore from the ore bodies lying between the north and the Justice's winzes on the second level is being vigorously prosecuted, the ore continuing of fine quality.

NEVADA.—The main south drift as well as the raise above still continues in the ore body, which shows improvement in both extent and quality.

JUSTICE.—Sinking the main incline below the 400-ft. station, for the purpose of opening a new level.

ALPHA.—The main north drift on the 1,500-ft. level is still pushed ahead.

BULLION.—The main north drift on the 1,700-ft. level from the Imperial shaft is making excellent progress.

JACON LITTLE.—The lower tunnel still continues in ore.

CHAPIN AND EAST COMSTOCK.—Work on the new hoisting works is progressing as fast as the weather will permit.

ELY DISTRICT.

AMERICAN FLAG.—*Pioche Record*, Feb. 7: Drifting has progressed rapidly during the week, running east and west from the ninth station—both drifts in ore. The Flag mill is working about 23 tons a day, and shipments of ore are made daily.

NEWARK.—Sinking and drifting was practically suspended for several days in consequence of necessary repairs to the machinery. Ten tons of very rich ore raised on Friday.

PIOCHE.—The main shaft is now down 600 feet, and sinking is constantly progressing. There will be no discontinuance until the shaft reaches 1,000 feet.

PAGE AND PANAOA.—Working the usual force of men, and running three drifts. Indications continue favorable.

PIOCHE WEST. Still sinking on the ledge through the main winze. Will drift east and west from this winze when it reaches a depth of one 120 feet.

HUEN AND HUNT.—Still pushing ahead on the cross-drift, which is liable to strike the ledge at any day.

CAROLINE.—Still drifting on the ledge, without any change worthy of mention.

SILVER PEAK.—Incline down 467 feet, with the ledge looking well at that point.

CONDOR.—Still drifting for the ledge, with very promising indications.

CHIEF EAST.—Still sinking winze in ore. The mine generally looks well.

PEAVINE.—Still drifting. Vein looks better, and hoisting some ore every day.

INGOMAR.—Still working, without material change.

HIGHLAND DISTRICT.—The Highland Consolidated Mining Company, through G. W. Maylone, foreman, took possession of the Mendha mill and mine, and the other property of the Highland Company. Work on the mines in Highland will be resumed this week, under very favorable auspices. Ample capital has already been advanced to work the mines to a success.

Lower California.

THE JAPA MINES.—*Cor. San Diego World*, Feb. 7th: The miners are all at work, doing well and many of them very well. Alonzo Somers, for instance, weighed the result of about four hours' washing yesterday, and found it worth \$67.50. This is not mentioned as extraordinary, as some of the miners in the Wash Jacobs camp above here, have done better, but simply as a traceable fact for those who are investigating.

The great trouble of our camp has been regular communication and reliability as to supply of provisions and freight. From this time, Jacobs, Cooper & Co. propose to run a regular stage line and are prepared to keep it up, rain or no rain. The necessity of walking from San Diego and packing blankets and grub is now past. The infancy of this camp is also past and its rapid development is beyond question.

Arizona Mines.

Mining matters for the year 1873 do not make as good a showing as they should, for the reason that the assessors in Yavapai, and probably other counties, did not gather the statistics required by an act of the last Legislature. We have only a partial report from the assessor of Mohave county, from which to collect reliable data.

In Mohave county, there were in operation during the past year, four arrastras, three furnaces, and one quartz mill. The mines are but a short distance from the Colorado river, and considerable rich ore has been sent to San Francisco and sold. The mines from which ore has been worked, of which we have knowledge, were the Sixty-three, Little Chief, Cupel & Tiger, Jackson, New Era, Diana, Keystone, Arnold, Sunday School, Silver Hill and Chas. Gross—twelve mines—from which the gross yield is reported at \$66,590. As several of the mines have only shipped a few tons of ore to ascertain its value, the yield is a good indication of the richness of the country. Many very rich mines have been discovered in the country during the year and considerable work done on them, but owing to the lack of mills or other reduction works, little ore has been worked.

In Yavapai county, little progress of note has been made.

There are eight quartz mills, one steam, and three water-power arrastras, and about twenty horse-power arrastras in the county. Five of the mills, owing to Indian troubles, sulphurets in the ores, and the drouth, have been idle most of the time for three years, and the reticence of the owners of those in operation, prevents a statement of the actual results, which we estimate from such information as is at hand, to be about \$55,000 in gold. More details from the arrastras have been received, showing the amount produced by them to be about \$23,000. The year was very unfavorable for placer mining, water being very scarce, except for a few weeks of summer during the prevalence of thunder storms. Yet a few men have been steady at work on each of the auriferous streams, and at the diggings at Weaver and Antelope Hill. The gross amount of placer gold received by merchants at the various points of supply, was but little over \$30,000. Thus our total production of gold for the year will not exceed \$110,000.

No reduction works for treating silver ores have ever been erected in the county, though experience shows that silver is the predominant metal in our mines, even in those which have been worked only for gold.

Since the Tiger silver mine was opened, something more than a year ago, thirty-five tons of ore have been shipped to San Francisco and there sold for \$16,455.14 (cents), a yield of \$470 per ton. Upon the dump at the mine there are about \$800 tons of ore, selected for working, which is estimated to be worth between \$80 and \$100 per ton.

It is known that the mines of Yuma county have been profitably worked, and the ore shipped to San Francisco, but no statement of the amount realized is at hand.

In Maricopa county, parties have been developing several valuable silver mines, but no ore has been reduced that we know of.

Considerable energy has been displayed in Pima county in opening old silver mines near Tucson, and in the eastern portion of the county, in working copper mines. The latter enterprise is evidently a paying one, but no figures have been furnished.

Although so little has been accomplished, our mining community is in better spirits than ever before. The subjugation of the Apaches leaves the field open to prospectors and enables men to work at less expense than formerly. A number of enterprises are on foot, looking to operations on a large scale, with sufficient means, and we are expecting this year, the commencement of a prosperous mining era in Arizona.—*Miner*.

EATING TOO MUCH.—While many people doubtless do eat too much, we believe that some are over anxious lest they should err in that direction. The following passage, from the translation of a recent paper by Dr. Max von Pettenkofer, is worth noting in this connection: "It is only a short time ago that it was customary in physiology to speak of a superfluous or luxurious consumption. According to certain physiologists, as long as the body is able to perform its functions, even though suffering from hunger, to take more food was luxury. But Bischoff and Voigt fully demonstrated by their experiments on nutrition that the result of nourishment so restricted is a state of want—a continual famine incompatible, in the long run, with the normal conditions of life. The body has used of a certain well-being—of a small excess of nourishment in order to preserve its strength and vigor. What just prevents death from hunger is not sufficient. It is as if we were to restrain the organism to produce any more heat than suffices to prevent death from cold, under pretext that all beyond this limit was superfluous and luxury."

ENGLISH LEAD AND SILVER.—The keeper of mining records reports, in this year 1872, 83,968 tons of lead ore, of the value of £1,146,165, were raised and sold in the United Kingdom; and that there was produced from these ores 60,455 tons, 15 cwt. of lead, of the value of £1,209,115, and 628,920 ozs. of silver, of the value of £157,230. Therefore, in 100 tons of ore there were 72 tons of lead, and in a ton of lead 10.4 ozs. of silver.

The Danbury News Man.

James M. Bailey, the "Danbury News Man," whose face is shown on this page is a humorist who has made his appearance in the world of letters within the past few years, and whose witty sayings are read with avidity by all fun-loving Americans. Whenever any one sees a short witty saying with a reference to Danbury or Nelson street, etc., he may be sure it emanated from Bailey's pen. He speaks of every day occurrences of home life in a most ludicrous manner, and the laughable incidents he portrays are so likely to have happened to almost any one, that his stories are more generally appreciated than those of other humorists. Mr. Bailey has lately published a work, containing a compilation of articles previously published in his paper, the *Danbury News*, which has met with a large sale. His quaint style of expression and phraseology is easily recognized after having read one or two of his effusions, and he has already a multitude of imitators, none of whom however, have been able to acquire his peculiarly original style. Mr. Bailey is still a young man, and has become famous within a year or two. Before he began to write, there were not many people who knew that Danbury was in Connecticut or that there was such a paper as the *Danbury News*. He has in a short time made himself and his paper famous. As Mr. Bailey is a new star in the literary firmament, and our readers will not find anything about him in the encyclopedia, we have given his portrait and these few remarks in connection with it, for the benefit of those who were curious to learn something of him.

J. M. BAILEY.

The Idaho Mine.

The *Foothill Tidings* speaks as follows of the Idaho (Grass Valley) mine: Idaho gold bricks are about the most regular articles in this line manufactured in the State just now, so far as we can learn. Every week, for so long a time that the folks at the bank consider it the habit of the mine, and make no ado about it, \$12,000 to \$20,000 worth of these handy little medallions of exchange make their way from the Idaho mill to Findley & Co.'s bank, and thence to the mint, to be fitted up, for general circulation. The stock of this company is not found on Montgomery street—and we think more of the mine because of this—but there is said to have been a sale made in private the other day, to a party who knows the mine well, of fifty shares, at \$750 per share. This is at the rate of \$2,325,000 for the mine, and we hardly think the heavy owners could be bought out for \$1,000 a share. Only a few years ago this mine was in the fix of the Kentucky, Magenta, and others to-day—prospecting by the aid of assessments. And the stock was often sold at nominal rates to obtain money to keep up these assessments. Many, indeed, sold out entirely, fearing they would never get anything after going down over 300 feet without pay. Good miners, who have seen the Idaho through its low, and to its high estate, say they consider the prospect in many of these struggling claims fully as good as it was in this now queen of mines in its assessment paying days. From assessments to dividends, like the step between the ridiculous and sublime, may at any time be almost instantaneously made.

REMOVING SNOW FROM ROADWAYS.—A rather roundabout method of accomplishing this is patented by a Mr. Hart, who proposes a small locomotive engine, which is surrounded at the sides by a casing, with inclined endless belts with buckets, which take up the snow from rotating brushes or wings and convey it over connecting chutes to a separate tank, where the snow is melted by steam connecting pipes and the direct application of heat. The different parts which come in contact with the snow are heated by steam from the boiler, to prevent the clogging of the machine and insure a rapid delivery of the snow to the tank. We hardly expect Mr. Hart's plan to supersede the regular snow-plow on long lines, or to successfully compete with the system of laying down steam pipes, on short ones.

Deep Gravel Mining—Big Blast.

Our distant readers may have little idea of the way banks of earth a hundred feet high are brought down and washed away for the spoils of gold found through them. The editor of the *San Juan Times* visited the American mine in Nevada county a short time since and says:

At the invitation of Mr. Spooner, we went up to the face of the bank and saw the miners tamping the tunnels. After these were all prepared the pieces of fuse were set afire, the small blast, 18 kegs, being lit some eight minutes before the second, which was the largest, being 420 kegs, and this in turn was lit a few minutes before the third and last, which was of 100 kegs. It takes about 20 minutes for a section of fuse, 50 feet, to burn, and while this was doing, all the miners retired to a distance of about 100 yards and awaited the result. Time seemed to move very slowly as we gazed on the lifeless bank, so soon to be in a convulsion.

The only sign of life was a thin wreath of blue smoke emitted by the fire in the fuse as it neared the powder. At last, however, the small blast went off and up went the large cement boulders and out came a puff of white smoke. It had done excellent work. Another suspense followed before No. 2 operated, but when it did come, a dull, heavy noise was heard and we were witnesses to the large bank making one leap up about twenty feet and then pitch headlong into the diggings all broken up and ready for washing. The third did the same and we have the miners' word for it that they all did good work. After it was over with we went to the place and where was before a high bank of almost unworkable cement there now lay a mass of broken up ground ready for easier washing by the pipes. The mine was then running 1,400 inches of water, through five nozzles—two on the west bank, one on the bottom, one in the "new diggings," formerly owned by Banks & Co., and one on the top dirt. Two drifts had already been started for another blast. In one of these they are running eight-hour shifts. The new tunnel is being sent ahead as fast as muscels and giant powder can put it. When it is ready for work, then all of the ground that they now are compelled to leave because of a want of grade to work will be washed into the Yuba. The tunnel is an extensive one and is 260 feet below that they are now using. This is low enough to work all of the ground and have "grade" left.

Lake County Quicksilver Mines.

The flattering prospects of Lake county mines now form the topic of conversation with almost every one we meet. From all accounts we may safely predict a brilliant future for our little county, hid away among ragged and almost barren mountains. Our hills, hitherto supposed to be worthless for anything save the wild home of the bear and deer, promise to pour forth such a quantity of the liquid metal as to place us in the foremost rank of mining counties. From Supervisor J. M. Davis, of Middletown, who is just from the scene of operations, we gain much information concerning our mines in general and of some in particular. The Great Western mine is turning out 250 flasks a month, with prospects of continuing in the same style. The Kearsage mine, in the Pine mountain, has run a six-foot tunnel, cutting the ledge through, and taken out \$2,500 of ore—the character of which is native and cinnabar. An assay of this ore in San Francisco yielded 22 per cent. of quicksilver and \$48 22 of gold to the ton. This mine is owned by J. M. Davis & Co. The American mine is being rapidly developed, with splendid prospects. A new furnace will be erected in the spring, when work will be vigorously prosecuted. The Middletown Consolidated Mining Company have a large body of ore in sight, and intend to push their work on the high-pressure principle next spring. E. W. Bradford has located a new mine, which prospects very favorably. A force of six men has commenced work on the "Big Injin" mine, owned by P. M. Daly & Co. The surface indications of this mine are very promising. Middletown seems at present to be the central point of our quicksilver mines, and they are being developed so rapidly and with such astonishing results that our importance as a mining county will soon have a world-wide reputation. We sincerely hope that time may prove our conjecture, and that our people may fully realize all the benefits of which they now so fondly dream.—*Lake Co. Bee*.

Mr. J. REDDY, an inventor, has introduced a new pick for excavating and other purposes. By the introduction of a socket-head on the end of the shaft of the pick, a taper hole passes through the head and handle, through which a cast-steel blade or tool can be inserted and withdrawn at pleasure, at a saving of time and expense, as a number of cast-steel blades can be taken with a pick. It is said the blade will resist the hardest substance, and the head or body will always remain fit for use.

FEATHER flowers are produced on the Continent; they are delicately dyed and arranged with great skill with reference to form and color. Relatively to the amount of labor involved and skill displayed in the fabrication, these flowers are sold on low terms.

Gold in the Yellowstone Country.

The Bozeman, (M. T.), *Courier* publishes the following letter: In 1848, myself and brother, John Rea, owned the Blackwater Mills in Cooper county, Missouri. An old trapper made it a practice of coming to our mills, and, being a dissipated man, while under the influence of liquor, would tell us wonderful stories of having discovered very rich gold diggings on the upper waters of the Yellowstone river. While trapping for General Ashley, he said, he made the discoveries. In the year 1838 he accompanied Ashley and Sublett's fleet of trapping-boats up the Missouri river to the Yellowstone. The aforesaid trapper was Owen Ruble, well and familiarly known to many people now of Missouri, especially by the earlier trappers and adventurers. Ruble said that himself and six others visited the Yellowstone country on a trapping expedition; when, after reaching the Yellowstone country, the Indians came upon them and killed all the company but himself; he only escaping by a trapper's ingenuity in dodging and hiding from the pursuing savages. He was pursued for three days by the blood-thirsty warriors. After his escape, he took a due south course, and on the second day of his hasty retreat, being weary and thirsty, he stopped at a small stream to refresh himself; and while drinking at this stream he discovered the bottom to be almost literally covered with nuggets of gold; and not having time to gather any considerable amount, he only gathered up a handful or two of nuggets, and put them in his shot-pouch. He then continued his course on south, towards the North Platte river. He there found some French trappers, and continued with them all that winter until early spring, when he returned to Missouri. He declared that there was plenty of gold in that wonderful country, but we regarded him as crazy on the subject, and attached no importance to his, as we thought, trapper's yarns.

In 1864, in company with many others, driven from our homes to seek our fortunes in the far North-West, I left Missouri for Alder gulch, and coming the North Platte route, a little incident, which I need not detail, brought me to the cabin of an old French trapper, living far up on the North Platte river, who corroborated much of old Ruble's report of gold in the Yellowstone country. He went on to say, in conversation with him in reference to this country, that if he could find an old trapper who came to his camp some twenty-three years ago, he could find all the gold he wanted. I asked him where it was. He stated that he did not know the precise locality, but that it was somewhere on the headwaters of the Yellowstone river. I asked him who this old trapper was; he said his name was Owen Ruble. I then told him I knew about Ruble, and of his tragic death. He then gave an account of the gold Ruble exhibited to the hand of trappers then together. He stated that a few days after Ruble came to his camp they all started on a buffalo hunt, and as was their custom, before setting out, every man was required to pour out all his bullets upon a blanket, and divide them equally among them. He says that when Ruble poured out his bullets from his shot pouch there was more gold than bullets, in nuggets of different sizes. "I asked Ruble where he got this gold, and he replied: 'I found it while running from the Indians on the Yellowstone.'" I asked him if he had any idea where the place was where he found that gold? Ruble replied that it was due north from that place, as he traveled due south.

This is a plain statement of facts as they came to me. I have no doubt that there are rich paying gold fields in that country. I hope the expedition fitting out may be successful in finding diggings richer far than any ever heretofore discovered in Montana. WILLIAM REA. Gallatin City, January 26, 1874.

THE PURE STUFF.—At Delano's bank one day this week we had the pleasure of hauling two bricks of pure gold weighing 528 ounces and worth over \$10,000, just in from the Empire mine. This is one of the oldest steady paying mines in this vicinity. It was located by Geo. D. Roberts and others in 1850, as the Ophir Hill lode. Old residents here still call it the Ophir. During its 24 years of existence this mine has had its ups and downs, passed through various hands and yielded several millions in gold. That it is not played out yet, but stands among our best paying mines, is evidenced by the steady production of such little remembrancers as those above mentioned. The shaft is down 1,300 feet on the incline and pay ore is being taken from the 12th, 11th and 10th levels. Mr. Bennalleck, the foreman of this mine, has been for some time prospecting in the direction of what is known as the Rush & Layton ground from the 800-foot level, being assured from certain indications known to practical miners, that something good would result. This week Mr. B. feels himself fully justified in his conclusions; having struck a ledge there showing well in sulphurets and free gold which is two feet thick.—*Foothill Tidings*.

The Co-operative Iron and Steel Works, at Danville, are in successful operation. This shows what may be accomplished by intelligent co-operation on the part of workmen. This company was organized about two years ago.

USEFUL INFORMATION.

Water-Color Decorations on Wood.

Our fathers appear to have had a horror of all plain woods, and quickly covered them up with cloth and woolen velvet and tapestry, or disguised them with painting, while our mothers were not less industrious in hiding such woods from sight by coverings of chintz, lace, and muslin. Nowadays we are beginning to perceive that these sober, quiet woods have a beauty of their own, and that they lend themselves with ready adaptability to the purposes of the furniture-maker, decorator, and designer. On the Continent even the plainest and least attractive of woods are used for furniture and decoration. Where, from a want of color or grain, the surfaces are not sufficiently varied or pleasing, they call in the aid of water-colors, and plant thereon pigments of considerable variety, beauty, and elegance, before these surfaces are submitted to the hands of the polisher.

The application of this mode of decorating is almost universal. It may be applied to pen-holders and work-boxes, to tables and cabinets, and it is our intention to advocate its more extended adoption by giving, from time to time, designs specially prepared for this kind of cheap artistic decoration.

The wood on which the design is to be made should be of as hard a quality, and with as little grain as possible. On the Continent the woods most used for this purpose are the plain white maple, linden, and box; but there are many suitable woods, some of which are of the cheapest kind. The chief point is to select a surface sufficiently close to prevent the colors from spreading, as they will do when the wood is too absorbent, or the colors used are too wet, and one on which has no dark markings or grain to interfere with the design. Having chosen your wood, and had it duly prepared in the form of a panel or table-top, or any other part of whatever article you have to decorate, the design is first drawn in outlines with a pencil lightly, in order that the surface may not be impressed. The white parts are painted on with Chinese white, the dark parts with Indian ink, and the shaded lines with sepia. The remaining portions are left untouched, unless the color of the wood is objectionable, in which case a warm grey would be a suitable tint for them. If the black portions are not uniformly and deeply black, go over them again. When the pigments are dry and hard, the pencil-lines of the design are retraced with Indian ink, and a fine mathematical pen.

The design being thus completed, and again hard and dry, it is ready for the polisher, who should do his work so thoroughly that the polish will resist effectually the action of moisture; which, penetrating to the water-color design, would soon damage, and eventually destroy it. The polished surface should be cleaned with a damp cloth, and well dried, to avoid this risk. —*London Furniture Gazette.*

ALL housekeepers have some time realized the difficulty of lighting a fire in a still, damp morning, when the chimney will not draw, and vigorous blowing proves ineffectual. Science explains the trouble as "caused by the difficulty encountered in overcoming the inertia of the long column of air in the pipe or chimney, by the small column of air that can be forced up through the interstices of wood and coal, at the bottom of which the fire is kindled." This may be remedied by first lighting a few bits of shavings or paper placed upon the top; thus, by the heated air forcing itself into the chimney and establishing there an upward current, the room is kept free from the gas or smoke which is so apt to fill the room; and the fire can then be lighted from below, with good success.

YOUNG engineers will find the following recipe a good one for polishing the brass-work of their engines: Rub the surface of the metal with rottenstone and sweet-oil, then rub off with a piece of cotton flannel and polish with soft leather. A solution of oxalic acid rubbed over tarnished brass soon removes the tarnish, rendering the metal bright. The acid must be washed off with water, and the brass rubbed with whiting and soft leather. A mixture of muriatic acid and alum dissolved in water imparts a golden color to brass articles that are steeped in it for a few seconds.

A NEW MATERIAL FOR INK.—Moigno states that the juice of the *coriari thymifolia*, or ink-plant of New Granada, resists most chemical agents better than ordinary ink. When used fresh, the writing is reddish, but it becomes black in a few hours. It does not corrode steel-pens, and cannot be removed from paper by sea-water, on which account it was used for all public documents when New Granada was under Spanish dominion, under the name of canohi.

M. GAUDIN has been making experiments to supersede borax, which is generally employed in soldering, and the result is that he finds that an excellent flux for soldering iron, and brazing copper and aluminum bronze, is obtained by a mixture of equal parts of cryolite and chloride of barium. Cryolite is a product and export of Greenland, and consists of a double fluoride of aluminum and sodium.

How to Sharpen a Screwdriver.

The screwdriver is found not only in the tool-chest of every mechanic, but in most homes, and in not a few offices. It ranks with the hammer, the saw and the axe, in general utility, and yet very few persons know anything about how it should be sharpened so as to do its work most efficiently; that is, with the least expenditure of power, and the least injury to the heads of the screws.

In driving a screw into wood, the force used to press the screwdriver against the head of the screw tends to aid the latter in penetrating the wood, but when we attempt to extract a screw, every pound of pressure that we apply tends to render it more difficult to get the screw out. It therefore becomes very important that the screwdriver should be so formed that it may be kept in the nick of the screw by the exertion of the very least degree of force; for if it has any tendency to slip out, we can keep it in place only by applying pressure, in which case we run great risk of injuring the nick and rendering it impossible to draw the screw.

If we examine a screwdriver in the condition in which it is ordinarily found, we shall find that it presents a section in which the sides of the wedge, in which all screwdrivers terminate, are curves with the convex sides outwards. Now, the effect of this curving the sides of this wedge, is to render it greatly more obtuse. Moreover, when we turn the screwdriver, the tendency to slip out of the nick is just in proportion to the obtuseness or bluntness of the wedge, and therefore this form is the very worst that can be chosen. In the hands of most good workmen, therefore, we find that the screwdriver ends in a wedge of which the sides are perfectly straight. This is a very good form, but is not equal to a form in which the sides of the wedge are curves, but with the concave sides turned outwards. In this way we lessen the obtuseness of the wedge at the extreme point, and produce a turn-screw which may be kept in the nick by the least possible pressure and twist. To grind a screwdriver into this form, it is necessary to use a very small grindstone, and many of the artificial stones found in market answer admirably. Many mechanics would find it to their advantage to keep one of these small grindstones for the purpose, as it could be run in the lathe with very little trouble. —*Technologist.*

BRONZING ARTICLES MADE OF IRON WIRE.

The following process is commended as the best and cheapest process: Clean the wire perfectly, and then immerse it in a solution of sulphate of copper (blue vitriol) until covered with a coating of metallic copper. Then wash and immerse the articles in the following solution: Verdigris, 2 ounces; sal ammoniac, 1 ounce; vinegar, 1 pint, diluted with water until it tastes only slightly metallic, then boiled for a few minutes and filtered. The articles are steeped in this liquor at the boiling point, until the desired effect is produced; but do not keep them in too long. When taken out, wash carefully in hot water and dry.

FASTENING IRON IN STONE.—A writer strongly recommends the use of zinc instead of lead for fastening iron railings into stone. It is well known that iron corroded with lead is consumed by rust very rapidly and destroyed. The zinc, however, established a galvanic circuit with the iron, and being positive to the iron, sustains all the chemical action and becomes oxidized, while no rust forms upon the iron. While with lead the opposite takes place, it makes also with iron a galvanic combination; but the iron being positive compared with the lead, it undergoes the chemical action, is oxidized, and protects the lead at its own expense.

A NEW material for use in circulating tubes for warming purposes has been suggested. It consists simply of glycerine in which calcium chloride or some other hygroscopic salt has been dissolved, so as to bring the specific gravity up to 1.40 or 1.45. Such a mixture boils at 300° to 320°, and may be used without loss of material in many kinds of apparatus for heating where steam, etc., is employed.

AN ARRANGEMENT FOR GETTING RID OF DELETERIOUS GASES IN THE LABORATORY.—Mohr suggests that such gases be either conducted through a rubber tube into the outside air, or into a Woulff's bottle containing milk of lime and in the second neck of which a funnel is placed containing small bits of charcoal.

SWEDISH FILTER PAPER.—Dr. F. Mohr discourses the use of this article. The author asserts that there are numerous brands of German filter-paper that are far superior, both as regards strength of tissue and small amount of ash, in addition to being very much cheaper.

ACCORDING to a French journal, horses and other animals may be protected from the persecutions of flies by painting with a pencil the inside of the ears, or other parts liable to be bitten, with a few drops of empyreumatic juniper oil.

AS A MEANS of avoiding explosions in the use of hydrogen apparatus, Fresenius says the gas may be passed through a tube containing a number of small discs of fine wire placed between cotton.

GOOD HEALTH.

Law of Transmission.

The *Herald of Health*, in answer to a correspondent, republishes Dr. Hough's observations, with comments, as follows:

1. In general, children of both sexes resemble their mother more than their father in physiognomy, habits, constitution and temperament.

2. Usually boys resemble their mother more than their father, in physiognomy, habits, constitution and temperament. In the same relationship girls resemble their father more than their mother.

3. As to whether there is any constant relationship between the physiological resemblance and a predisposition to the diseases of the person resembled, it is very difficult to decide from the data at hand; but it would appear from the few facts in which any observations were made in this direction, that there was a large percentage of cases in which inherited diseases were exhibited where there was such physiological similitude. In other words, children have resembled one parent in general physiognomy, while they have inherited the constitutional peculiarities and diseases of the other more frequently than where they have derived both these conditions from (one) the same parent.

In general, then, hereditary and acquired diseases and defects are more likely to be transmitted to offspring of the sex in which they originated, and thereafter to be subject to the principle of sexual limitation, either directly from the parent to child, or by interrupted or atavistic descent, from grandparent to grandchild.

Though sons are usually best able to follow the advocacy of their fathers, it is undoubtedly true that men inherit the genius, talent and intellectual excellence and morality of their mother or mother's father, while daughters inherit the same quality from their father or paternal grandmother.

Females more frequently transmit hereditary diseases and defects than males, though they less frequently exhibit them. Males less frequently transmit, and more frequently exhibit, inherited diseases and defects.

The reason that females do not exhibit hereditary disease as frequently as males is because of a higher degree of vitality in them which gives them greater power to restrain the appearance of the predisposition, and an inferior degree of development evolution, retaining in their constitution as germs what in men become fully developed diseases and defects.

POISONOUS COLORS.—In opposition to our expressed opinion that all anilin colors are not necessarily poisonous, some of our contemporaries think that it is better to err, if at all, on the safe side, and to avoid the use of anilin dyes for culinary purposes altogether. We do not object to this advice, and surely those anilin dyes in which arsenic enters as a component part are certainly poisonous. A warning has even been raised against fabrics dyed with anilin colors as injurious to the wearer. This has been contradicted by German chemists, who think to prove that it cannot be so. But then it is asserted that people have been poisoned and no sufficient cause could be found than the wearing of anilin dyed clothes. A writer in California goes even so far as to assert that carmine is a fully poisonous, and hangs up an alarming tableau of the consequences—loosening of the teeth, falling out of the hair, scrofulous eruptions, dyspepsia, insanity and idiocy. It is curious that carmine has from time immemorial been considered utterly harmless, and used by druggists to color tinctures, etc. It is also stated that experiments were made in France, and that a baby died under terrible convulsions after eating four ordinary plates of ice-cream, colored with carmine. Our esteemed contemporary, the *Boston Journal of Chemistry*, remarks justly in this regard, that four ordinary plates of ice-cream are very likely to disagree awfully with a baby, whether it (the cream, not the baby) were colored with carmine or not. —*Manufacturer and Builder.*

PHYSIOLOGY.—Prof. Garrod has set up a hypothesis that nerve force is generated by thermo electricity, generated by the difference in temperature of the inside and outside of the body. The experiments of men exposed for a long time to a temperature equaling the blood heat appear not to favor this hypothesis, because notwithstanding it must be acknowledged that such a temperature is not promotive of health or comfort, the simple fact that man can live in an atmosphere of which the temperature equals that of the interior of the body, is a proof that nerve force does not depend on this. It depends of course on the consumption of food, absorption of oxygen by the act of respiration, and the continual repairs of all the tissues, nervous and muscular, by the materials contained in the blood.

POISONING BY PLANTS AND INSECTS.—A standing antidote for poison by oak, ivy, etc., is to take a handful of quick-lime, dissolve it in water, let it stand half an hour, then paint the poisoned parts with it. Three or four applications will never fail to cure the most aggravated case. Poison from bees, hornets, spider-bites, etc., is instantly arrested by the application of equal parts of common salt and bicarbonate of soda, well rubbed in on the place bitten or stung. —*Boston Journal of Chemistry.*

Topical Application of Heat.

A correspondent of the *Boston Journal of Chemistry* recommends the topical application of dry heat instead of cloths moistened with hot water, fusions of hops or other plants, in cases where these remedies are usually employed. He considers this application much better than moist applications, as the latter, when they become cold, often chill the parts, and require to be frequently renewed and re-applied. In making the application of dry heat he has sought for the best medium, and instead of sand and other substances, of which the weight is objectionable, he proposes to substitute ordinary Indian meal, which is of very light weight and not unpleasant in odor, and holds heat for a very long time. In regard to the heat-holding qualities of the meal he speaks as follows:

"This latter fact I noticed when a mere boy, finding that corn meal would, after grinding, bear several miles' transportation, and, after delivery and deposition in the bins of the granary, would for hours still be warm from the friction of grinding. When, therefore, it is desired to apply dry heat to any person, it is only required to place a quantity of the Indian meal in a baking pan on a heated stove, and stir constantly till thoroughly warmed. It should not be burnt. It can now be put into woolen sacks and tied up and applied as a hot bottle usually is, or into large flannel bags, if for the abdomen. In a case of successful resuscitation of a new-born child, the heated meal was poured into an oblong chopping tray, a flannel cloth laid over it, and the infant in it. The cloth yielded, and the child was partly buried in the warm meal. It is found that the meal retains its heat long, and when it cools it does not chill, which is a very important consideration. Two sets of bags or wrappers may be provided, so that while on its being applied the other may be heated. The meal is not weighty. The aroma of it when heated is rather agreeable than otherwise."

Diseases of Artisans and Mechanics.

A careful investigation has been made of the special diseases incident to the occupation of artisans and mechanics, and the following are some of the most interesting among the mass of facts and data brought to light:

It appears that gliders are subject to mercurial affections. They suffer from giddiness, asthma, and very frequently from partial paralysis, which often induces a peculiar kind of stammering; they also frequently suffer from unpleasant ulcers in the mouth.

Miners in the quicksilver mines suffer from vertigo, palsy and convulsions, and the occupation cannot be pursued a long time.

Pottery glazers, who use lead largely, get into a condition very similar to that described above, with the addition of dropsy, loss of teeth, and enlarged spleen. Palsy of the limbs, especially of the arms, is a common disease among them, as also is consumption.

Glass-blowers are the victims of those affections produced by sudden vicissitudes of temperature—rheumatism and various inflammations. They are apt to become thin and delicate, and their eyes get weak.

Stone-cutters inhale the sharp particles, which tend to produce disease of the lungs, while plasterers suffer from the gases disengaged and from excessive moisture—they are also troubled with labored breathing, and they digest badly.

A CASE OF OPIUM CURE.—The *Druggist*, of London, says that a young lady who had been long accustomed to the use of opium applied to an eminent physician to make hypodermic injections of morphia. He commenced by making the injections as desired, of morphia and water; by degrees the quantity of morphia was lessened without her knowledge, until within a few days nothing but pure water was injected; after each injection she would lapse into a quiet sleep, in the same manner as she had been accustomed to do under the actual use of morphia. This treatment was continued for several months, during which time tonics had been used, to strengthen the system and bring about a healthy condition after being so long a time under the influence of opium. When he considered it safe to do so, he told her plainly that she had not taken a particle of morphia for several months, and was entirely free from its influence; this statement of course was received with intense surprise, as well as unbounded joy. The lady is to day entirely free from any desire for opium.

DURING the reheating of the furnaces in an iron establishment in England, says the *British Journal of Science*, the men worked when the thermometer, placed so as not to be influenced by the radiation of heat from the open doors, marked 120°. In the Bessemer pits the men continue a kind of labor requiring great muscular effort at 140°. In some of the operations of glass making the ordinary working temperature is considerably over 1000°, and the radiant heat to which the workmen are subjected far exceeds 212°. In a Turkish bath the shampooers continue four or five hours at a time in a moist atmosphere at temperatures ranging from 105° to 110°. In enamel works men labor daily in a heat of over 300°. On the Red Sea steamers the temperature in the stove hole is 145°. And yet in none of these cases does any special form or type of disease develop itself.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—A Quicksilver Pump; The Comstock Mines; Burning Quartz Before Crushing, 113. The Danbury News Man, 118. A Prosperous Season; The Greatest Mine in the World—Ten Millions and a Half in One Year; Academy of Sciences, 120. The California Acclimatizing Society; Improvements in the Sextant; Automatic Telegraph, 121. Mining Assessments; Patents and Inventions, 124.

ILLUSTRATIONS.—A Quicksilver Pump, 113. J. M. Bailey, 118. New Forms of Sextant, 121.

CORRESPONDENCE.—A Miner's Opinion on Mining Laws; Hydraulic and Lode Mining; That Mining Bill Again, 114.

MECHANICAL PROGRESS.—Little Engines; Improved Wood Fence; Hinged Fire-lighters; Another Type-Writing Machine; Safety Hoisting Apparatus; Cotton Seed Planter, 115.

SCIENTIFIC PROGRESS.—Can Electricity be Profitably Employed as a Source of Power? Iron in Plants; The Philosophy of the Sand Blast; The Detection of Death; Explosion of Chlorine and Hydrogen, 115.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 116.

MINING SUMMARY from various counties in California, Nevada and Lower California, 116-117.

USEFUL INFORMATION.—Water-Color Decorations on Wood; A New Material for Ink; How to Sharpen a Scavenger; Bronzing Articles Made of Iron Wire; Fastening Iron in Stone; An Arrangement for Getting Rid of Deleterious Gases in the Laboratory; Swedish Filter Paper, 119.

GOOD HEALTH.—Law of Transmission; Poisonous Colors; Physiology; Poisoning by Plants and Insects; Topical Application of Heat; Diseases of Artisans and Mechanics; A Case of Opium Cure, 119.

POPULAR LECTURES.—Professor Neri's Lectures—No. 3, 121.

MISCELLANEOUS.—Stickeen and Cassiar; Copper, 114. Arizona Mines; Eating too Much; Eggs, Lead and Silver; The Idaho Mine; Removing Snow from Roadways; Deep Gravel Mining—Big Blast; Lake County Quicksilver Mines; Gold in the Yellowstone County; The Pure State; Irish Mining Operations; A Miner's Views on Quicksilver Bills; The Raymond & Ely Mine; Steam Pipes in Mines; French Mine, 122. The San Juan Country; Native California Coffee; Do We Use Sufficient Seed? 123.

A Prosperous Season.

From a miner's point of view the present season is an exceptionally favorable one. The abundant and drenching rains of the past few months have soaked the ground down to bed rock in most localities, and the miners are jubilant. It is often said that a special committee in the interests of the farmers would be unable to regulate the weather to suit more than half of the farming population, even if they had the power; but we are of opinion that the most exacting of miners are pretty well satisfied this year, if the farmers are not. The heavy snows have laid up a summer supply in the mountains, and the sluicing season will last along in the year.

The hydraulic miners, who are a numerous body, all rejoice over these facts, and can dream of heavy streams, heavy runs and heavy "clean-ups," with a certainty of their dreams becoming realities. None of them "growl" when they have all the water they want, for that is the most important consideration to them. The ground is of no value without water, while, with an abundance of it, the old hills will be astonished at the facility and speed with which they are transformed into valleys, and their locked-up treasures wrested from them in the process. Considering the attention our hydraulic mines have attracted abroad during the past years, the present season is a peculiarly fortunate one. An abundance of water will increase the yield and still further advance this class of mines in the estimation of those who are looking toward their purchase. Speaking generally, the outlook for mining affairs all over the coast, for this year, is better than we have ever before experienced. From all quarters we hear of new mines being opened, new improvements being made, mills being repaired and operations on an enlarged scale being commenced. We are going to work in earnest now-a-days on this coast, and will try to mine—not scratch and burrow.

The Greatest Mine in the World—Ten Millions and a Half in One Year.

The Belcher mine, in the Comstock lode, Nevada, is without doubt the greatest bullion producing mine in the world. It has produced in the last two and a half years the immense sum of \$16,772,965. In 1873 it produced \$10,779,171 and paid out as dividends \$6,760,000 during the year, a large surplus being carried forward. The annual meeting of the stockholders was held on the 27th ult., as we mentioned at the time. The pamphlet report of the Company was issued this week and from it we condense many interesting items. Before doing so, however, we may mention that the mine contains 1,040 feet divided into 104,000 shares. The first bullion produced was in 1864, at which time it paid a dividend at the rate of \$21 per foot or 21 cents per share on the present issue. In July, August and December of that year dividends of \$24 per foot were paid. In January, 1865, the mine paid \$51 per foot; \$60 in February and \$75 in March; \$75 in April and \$51 in May. Within a year, nine advances were paid, aggregating \$421,200. From that time until April, 1871, assessments were levied to work the mine. There were 21 assessments, aggregating \$660,400. At that time the assessments were \$239,200 in excess of the dividends. During these seven years of unproductiveness the mine was continually worked, though at times the stock sold for less than the delinquent assessment. In October, 1870, shares were sold as low as what would be equal to 10 cents per share of the present issue. As the ore developments improved, the mine of course increased in value to a wonderful extent. The mine has paid dividends regularly since January, 1872.

Ore and Bullion Statement

Gives the product of the mine for the past two and a half years.

By adding the dividends under the old organization and deducting the assessments levied, we have the following results up to this month:

Dividends June 1864 to May 1865 inclusive.....	\$ 421,200
Dividends to 1872.....	2,184,000
Dividends " 1873.....	6,760,000
Dividends in Jan. and Feb. 1874.....	1,040,000
Total dividends.....	\$10,405,200
Assessments Dec. 1865 to Apr. 1871.....	650,400
Stockholders' profits.....	\$ 9,744,800

Ore Products.

Following is a statement of the monthly milling operations of the mine for 1873:

	Tons Worked.	Bullion.	Average.
January.....	8,501	437,489	\$51.46
February.....	10,417	730,014	70.08
March.....	12,008	888,393	73.98
April.....	15,981	1,184,476	74.11
May.....	18,965	1,500,824	79.15
June.....	13,074	914,592	70.33
July.....	13,685	912,781	66.70
August.....	10,483	691,768	65.99
September.....	9,876	647,710	65.58
October.....	12,825	831,263	64.82
November.....	13,702	940,196	68.61
December.....	15,147	1,099,074	72.60
Totals.....	164,664	10,779,171	\$69.69

Cost of Production and Reduction.

The detailed cost for producing and reducing 154,664 tons of ore, was as follows:	
Labor.....	\$85,503.97
Hoisting ore, (Jacket Co.).....	86,653.00
Supplies, (tools, etc.).....	108,750.00
Timber.....	116,760.00
Assay charges.....	9,906.79
General expenses.....	14,430.22
Freight, supplies, etc.....	8,676.05
Wood and coal.....	85,876.11
Salaries and office expenses.....	21,235.00
Total.....	\$1,317,876.14
The cost of crushing the ore was \$12.10, and the cost of mining was \$8.51 per ton; total, \$20.61. In 1872 the cost of crushing was \$12	

per ton, and the cost of mining was \$9.07; total, \$21.07. The number of tons worked in 1873 was 154,664; in 1872 the mine produced 83,195 tons. The total receipts of bullion in 1873 were \$10,779,171.07; in 1872, they were \$4,794,659.10. The average yield per ton in 1873 was \$69.69 and in 1872 it was \$57.63.

The bullion statement is as follows, from the stamped value of bullion for assay certificates: Value in gold, \$5,725,247.50; value in silver, \$5,009,520.51; assay grains, \$44,403.06; total, \$10,779,171.07. Number of ounces of refined bullion, 4,173,535.74-100. Average fineness of gold, 66 1/2 thousandths, average fineness in silver, .929 thousandths. Value per ounce in gold, \$137.19-100; value per ounce in silver, \$1.20-2-100. Value of bullion per ounce \$2.57-21-100; average value per ton in gold, \$37.16; average value in silver, \$32.53; total value per ton, \$69.69. This statement will appear strange to those who suppose the Comstock lode produces nothing but silver, as it shows that in this, the greatest producing mine on the lode, the gold predominated. The Secretary's report gives the following as

Receipts.

Bullion.....	\$10,779,171.07
Virginia and Truckee R. R.....	2,117.24
Cash, Jan. 1st 1873.....	1,011,124.11
Total.....	\$11,792,412.42

Disbursements.

The Superintendent's Report.

From the report of the Superintendent, W. H. Smith, we found that of the 156,000 tons of ore, 40,000 tons came from the 1,000-foot level, 16,000 tons from the 1,100-ft. level, 40,000 tons from the 1,200-ft. level and 60,000 tons from the 1,300-ft. level. The main incline has been sunk 380 feet and stations opened on the 1,200-ft., 1,300-ft. and 1,400-ft. levels. On the 1,000-ft. level the ore body has been worked out 200 ft. in length and 98 ft. in height, varying from 15 to 98 ft. in width.

On the 1,100-ft. level work was suspended in July last, all the high grade ore having been extracted; there still remains on this level from 10,000 to 15,000 tons of low grade ore.

The 1,200-ft. level looks as promising as the Supt. has ever seen it, and he judges that the product this year will equal the last.

The ore taken from the 1,300-ft. level up to the present has been hoisted through the Yellow Jacket shaft. The ore yet remaining on this level will at least equal the amount already extracted from it, and prove quite as good. The appearance of this level as far as opened is as good as any of the levels opened in the mine, a significant fact in reference to the continuance of the ore body with depth.

Careful estimates of the quantity of ore now remaining in the mine show that there are at least 150,000 tons. The openings to the mine and the appliances are all in first-class order, and will compare favorably with any on the Comstock.

On the surface a number of improvements have been made this year. A switch and bridge from the railroad has been built for the purpose of receiving supplies for the mine. The ore dump has been enlarged to double its former capacity; the boiler room has been enlarged and four boilers added. Machines for repairing and four boilers added. In addition, a Burleigh air compressor and two Burleigh drills with 1,400 feet of 6-inch pipe to carry air from the compressors to the machines, have been purchased. This is most complete apparatus of the kind on the Coast and is a perfect success.

During the year, 3,692 lineal feet of ore, and winzes have been run, 380 feet of main incline, and 4,072 feet of car track laid. The material at the mine and in Carson is valued at \$142,337. At the first of the year there were on the dump and at the mills 1,340 tons of ore to be reduced, which were extracted during the year.

This mine has no parallel in the world, the Crown Point adjoining it being the only one approaching it in richness. The mine produced in two and a-half years nearly seventeen millions of dollars, and since its opening has paid nearly ten millions of dollars as dividends above all assessments. The success of this and the Crown Point has encouraged mine owners on the whole Comstock to pursue developments at greater depths. The circumstances connected with the development of the Belcher into a first-class mine furnish an example for other mines in similar circumstances. After their ore gave out, they worked systematically and uninterruptedly until they developed the largest ledge ever opened in any mine in the world.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held at their new rooms on Monday evening last, President Davidson in the chair. The following named gentlemen were elected to membership: George W. Beaver, Hon. George Oulton, G. Niebsnm, life members; Dr. J. G. Moore, John C. Merrill, Csrton Newman, Thos. B. Bishop, Frederick Msson, John R. Sherrstain, J. E. Squire, H. F. Cooper, Emanuel Newsmn, F. C. DuBrutz, and James S. Gilham, resident members.

Among the donations to the museum were the following:

From W. H. Dall, large collection of fossils of the post-pliocene period, from Esmeralda, on the west coast of South America, near the equator, collected by Captain R. A. Hodgkins, of the schooner "Urania."

From a member of the Coast Survey, a crustacean from the Island Miguel, supposed to be a new species.

From Captain E. E. Smith, specimens of coal from the Arctic coast, near Point Lisbon. The coal was observed in that locality for a distance of thirty to forty miles, and crops out in veins of great thickness.

From Mrs. James McEwen, an object supposed to be a petrification, obtained on the Poso Caliente Rancho, Sonoma county, in a portion known as the Indian Garden. The lady had also discovered, in the same locality, stone-wrought mortars and other Indian implements, which were tendered to the Academy.

Deep Sea Soundings.

Professor Davidson announced that he had received permission to inform the Academy of the important results of the soundings made by Captain George T. Belknap, of the United States steamer "Tuscarora," during last year, with reference to the projected laying of a telegraphic cable from this coast to Japan, and which he proceeded to explain with the aid of a series of large charts and profiles prepared for the occasion. This work had accomplished a remarkable development of the depths of the Pacific Ocean, which had no parallel in the plateaus of the Atlantic. The "Tuscarora" first started in her line of soundings from the entrance to the Straits of Fuca, across that portion of the North Pacific designated as the Gulf of Alaska, toward the Asiatic coast. After leaving the entrance to the straits, the bottom slopes gradually to a depth of 100 fathoms, and then a sudden descent occurs, which reaches a depth of 1,400 fathoms, at a distance of 150 miles from the coast. The temperature of the water at the greatest depth on this line of survey was 34 degrees.

Commander Belknap then returned, prosecuting off and on soundings all along the coast to the entrance of San Francisco bay. This work determined the fact that the sudden descent of the bottom of the Pacific to a great depth is continuous down the entire coast, varying from twenty to seventy miles out. In the latitude of San Francisco bay, the great bench is reached a short distance off the Farallones, where the bottom suddenly descends to a depth of two miles. Off Cape Point weather the bottom descends precipitately from 400 fathoms to a depth of 1,500 fathoms, and then the plateau continues westward for hundreds of miles, and comparatively as level as a billiard-table. Off Cape Mendocino, where shoals have been erroneously supposed to exist, from the seaward jutting of the mountains, a depth of 2,200 fathoms is reached eighty miles from the shore. Thirty miles off the Golden Gate the bottom is reached at 100 fathoms; at 55 miles it has descended to 1,700 fathoms; and 100 miles out, the enormous depth of 2,548 fathoms has been measured without reaching bottom. The Professor has prepared some interesting tables in connection with temperature and depth, etc., which we will shortly produce in connection with a more detailed article on this subject.

Miscellaneous.

A paper by Henry Edwards was submitted by title and referred to the publication committee. It is the fourth of his papers on the "Pacific coast Lepidoptera."

The President referred to improvements in sextant for hydrographic work, made by Mr. Lowry of the Coast Survey, which is spoken of more at length in another column.

Mr. Stearns promised a paper on the mollusca of the Atlantic and Pacific Oceans and their relation to each other, a subject suggested by the President's remarks on ocean currents and temperatures.

EMMA.—A private letter from Salt Lake, Feb. 10th, informs us that sales of Emma dated Feb. 10th from the new strike in the mine, are as follows: 25 tons, deepest work, 320 ounces per ton, \$38,000; 29,000; 100 tons, 230 ounces per ton, 100 tons of third class ore, 230 ounces per ton, \$25,000; 100 tons of fourth class, 132 ounces per ton, \$15,000. Total value of the 325 tons, \$107,000. Good for Emma.

THE WHITE PINE TUNNEL.—A petition, circulated through Eastern Nevada, has been signed by 2,000 names, asking Congress for permission to run a railroad tunnel, of light or nine miles in length, through the White Pine mountains. They ask for no subsidy or loan; merely the franchise of the land.

ON FIRE.—"Ore Beds—Their Origin and Conditions," also, Letter from "J. D. P."

The California Acclimatizing Society.

This Society, which has now been permanently established has in the short time it has been in operation been productive of many benefits to the State of California.

In January, 1870, there was organized the "Ornithological and Piscatorial Acclimation Society of California," which had for its object the introduction and acclimation of game birds and fishes, on the Pacific slope. The original plan contemplated its support to be derived from contributions of the members, but it soon became apparent that the amount that would be so received would be inadequate to accomplish the desired results; the Society was therefore re-organized as a joint stock company, and incorporated under its present name. Commencing operations under this new arrangement, the Society entered into communication with kindred institutions in the Eastern States and elsewhere, and started a system of purchase and exchanges, from which signal benefits have since been derived.

In January, 1872, the first installment of Eastern trout ova were received from Seth Green, for which hatching troughs were constructed at Hayes' Park. The ova were hatched with a loss of about 50 per cent. The results of this first experiment induced the Trustees to locate their subsequent operations at San Pedro ranch, where are now contained in the nine separate ponds, (since constructed,) Eastern, Native and Tahoe trouts, and Lake Ontario salmon trout, and a few black and rock bass. At San Pedro there will in a few days be constructed an enclosure, wherein the wild turkeys, received from Judge Caton, of Illinois, will be kept for breeding purposes.

The operations of the society having assumed greater proportions, they are now conducted with a certainty of success; the dams, ponds, hatching houses, cages, and other improvements have attained a fixed value. During the past year the most cheering results have been realized. The society is now able to supply any amount of ova or young fishes that may be called for; it has demonstrated that the hatching process can be carried on in California every day in the year, by exchange of eggs from different parts of the world; and that while the period of incubation in this State is shorter, our fish are larger and come to maturity sooner than they do in the Eastern States.

The financial aspects of the Society are no less flattering; while its assets, including stock, fish, ponds, houses, fixtures and utensils, are estimated to be worth \$20,000, its liabilities amount to only \$1,500.

An assessment has recently been levied in order to expunge this indebtedness, and to make further improvements in and about Lake Merced, (now under lease to the society,) which has been stocked with 300,000 fish. It is proposed to throw open this lake during the coming fishing season to the public, and to charge such a fee to anglers as to make it a source of income. This, with the proceeds of a sale of 50,000 young fishes, shortly due, and such other receipts which the past justifies them in anticipating, will enable them to conduct future operations without requiring further assessments from the stockholders.

It will thus be seen that the Association is conferring an absolute benefit, not merely to those who may go in search of a few weeks' enjoyment during the season, but to society at large, for in propagating fish and birds, and keeping our streams and woods inhabited by them, they are ministering both to the pleasure and wants of the people. Many streams within the vicinity of San Francisco, which once contained large numbers of fish, and the shooting grounds which were alive with game, are now unproductive; and the process of gradual destruction would still go on until all game would be exterminated, unless some such conservative organization as is here represented took active measures to prevent this unfortunate result.

NEW ELECTRICAL MACHINE.—By the late Panama steamer the St. Ignatius College, of this city, received from Paris one of Nollet's improved electrical machines. This is the apparatus with which the French government has of late years been experimenting, with the view of introducing the electric light for light-house purposes. The machine is now in place at the College on Market St., and will probably be in full operation ere we go to press. It is one of the most powerful machines ever constructed, and is one of twelve which were recently manufactured for the French Government, and the only one of its class in this country. So much interest attaches to it that we propose to prepare an engraving for the purpose of illustrating its construction and use, which will probably be ready for our next issue.

"A SUBSCRIBER," writing from Brigham, Utah, is informed that we are unable to give the names of the Trustees of the Ironsides, Gold and Silver Mining Co., re-incorporated a short time since, either in this State or Nevada. It may have been re-incorporated under some other name, or in Nevada, but we have been unable to find the name among recent incorporations in this city.

Snow.—More snow has fallen on the Sierra Nevada mountains the present season than ever before known. This looks well for a prosperous season in the milling and agricultural line.

Improvements in the Sextant.

At the last meeting of the California Academy of Sciences, Professor Davidson described some improvements made in the sextant by T. J. Lowry, of the U. S. Coast Survey. The improvements referred to are very important, making the instrument better adapted for hydrographic work than it has heretofore been. The sextant is the most universal of instruments in the hands of the geographer, navigator and astronomer, because it alone is available at sea as well as on land. To the navigator it is invaluable; and in the special work of hydrography along a coast line, where the position of the boat or vessel is generally determined by observing from the boat, the sextant is the only instrument of precision in use, and yet in its present forms it has certain deficiencies which prevent its universality of application. It fails to measure the angles between one hundred and forty and one hundred and eighty degrees, and the hydrographers of all countries have studied to remedy this defect with only partial success.

M. Daussey, the French hydrographer, measurably solved the problem by a device as simple in construction and beautiful in theory as it is difficult in practice. By means of a second

Figure I.

Figure III.

NEW FORMS OF SEXTANT.

horizon glass, he added, as it were, a constant angle of about ninety degrees to that measured by the index and horizon glasses, and thus obtain any angle from naught to one hundred and eighty degrees. In observing large angles he reflects both objects, which increases the difficulty of manipulation by the observer even when on land with well defined objects, but when the observer is in a boat, disturbed by the waves, and both objects indistinct, it is next to impossible to see them; and certainly not with any degree of quickness, which such operations especially demand. Daussey's instrument has not come into practical use.

Piston & Martins of Berlin have also partially solved the same problem with the prismatic sextant bearing their name. This instrument will measure any angle from naught to one hundred and eighty degrees whilst reflecting but one object, but in measuring the angles from about one hundred and forty to one hundred and eighty degrees the sextant must be inverted, and the manipulation is therefore embarrassing. Their sextant is too heavy for practical use and has not been largely adopted.

Mr. Lowry has solved the problems very ingeniously, and Prof. Davidson had models made to exhibit their practical application. And in studying the subject several other problems which occur to the practical hydrographer had been very well solved. In the work of the U. S. Coast Survey and in the hydrographic surveys conducted by the navies of all countries there arise daily demands for such instrumental aid to solve these problems, and it is believed that most of these devices of Mr. Lowry are novel. Very few can thoroughly appreciate their full value unless they be practical hydrographers.

Mr. Lowry has given the following statement of the requirements demanded by the hydrographer in his work and the solutions thereof: *Problem I.* To measure with a sextant any

angle from 0° to 180° without inverting the instrument and while reflecting but one object.

This may be solved in the following manner: The front and back faces of index glass (of ordinary sextant) are made reflectors, and a second horizon glass placed on the line of sight (behind the index glass) and at such an angle as to reflect the rays, which are reflected first from the back face of the index glass, parallel to the line of sight. *Fig. I* illustrates this form.

We here have an arc of only 60 degrees, graduated as usual from 0 degrees to 120 degrees, with a second reading of the same arc, commencing at 0 degrees as 120 degrees, and numbered to 240 degrees at 120 degrees. This adaptation may be designated as the "double reflecting index glass."

Problem II. To make the sextant capable of measuring two angles, one to the right and the other to the left of an object, at the same instant; either angle being any number of degrees from 0 degrees to 120 degrees.

In practice, the hydrographer sets his index arm so that the reflected and direct images of the objects (say left hand and middle) of one of the angles which he is to measure, are not coincident, yet approaching on account of the progress of the boat, then with the second index glass he makes the direct and reflected images of the middle and right hand objects coincident, and keeps them coincident with tangent screw until the first two objects are coincident.

Figure II.

Figure IV.

This Problem II he solves in four different forms of the sextant. In *Fig. II* there are one horizon glass and two index glasses; one of the latter mounted directly over the other; but each attached to distinct index arms, which have a common center of motion. The arc is 120 degrees instead of 60 degrees, as in the ordinary forms, and the graduation is numbered in opposite directions, from 0 degrees to 120 degrees (actually at 60 degrees from each zero).

A modification of this form is given by making each index-glass half the width of the ordinary form, their inner edges meeting as it were over the center of the instrument, and thus allowing them to move in the same horizontal plane.

Figure III exhibits the next solution of this problem, and affords a much more stable instrument, suited to the rough usage of boat duty. This form is unique. There are two index and one horizon glasses whose centers of motion are in the same straight line and in the same horizontal plane; but the index glasses have independent centers of motion, so that the arcs of graduation, although of "one piece and in the same plane have different radii. The graduation is from 0° to 120° from each end to the theoretical junction of the arcs. The index glass nearest the horizon glass is one-half the height of the other one.

The fourth solution gives to the ordinary sextant an extra index-glass which may either move in the same or a parallel plane to that of the other index glass—and this extra index-glass has an arm which moves on the under face of sextant, but its extremity is curved so as to bring its vernier upon the same graduation as the upper index arm.

Problem III. To make the sextant capable of measuring two angles, one to the right and the other to the left of the central object, in quick succession, without previously estimating their relative magnitudes or inverting the sex-

tant or lengthening its arc. This is done by using the ordinary sextant with the addition of a second index glass secured upon the usual index glass and at an angle of 60 degrees therewith. It is thus evident that when one index glass measures an angle of 120 degrees the other is at the zero of the first. The index glasses may be placed one above the other or in the same horizontal plane. With this there is also added a detachable stop with vernier at the extremity of the index arm bearing its usual vernier. This stop to be so adjusted that when clamped it will allow the index arm to move freely for the next angle.

The ordinary sextant may be made to measure an angle and give an inter-range at the same instant by placing a low mirror upon the frame, and in a line joining the centers of motion of the index and horizon glasses, and at such an angle as to reflect the rays, parallel to the line of sight, from the back object, into the horizon glass. This is a modification of Daussey's improvement, but fulfils many conditions which his will not.

Automatic Telegraph.

The President of the Western Union Company having set forth, in a published letter to the Postmaster General, under date of December 27, 1873, concerning the Automatic or fast system: 1st. That the Automatic system is slower than the Morse; 2d. That it requires five times as many operators; 3d. That consequently it is more expensive, the Automatic Company determined to test the accuracy of these statements by a public demonstration over their line of one wire between Washington and New York. The trial took place on the evening of the 27th ult. By invitation; the electrician of the W. U. Co., Mr. Geo. B. Prescott, was present in New York, and Mr. Whitney, manager of the W. U. office, Washington D. C., was at that end. In addition there were present in the New York office, Hon. Hiram Barney, Gen. J. H. Wilson, H. G. Pearson, Assistant Postmaster, and Mr. Hinchman, also of the Postoffice Department, New York, J. G. Smith, General Superintendent of the Franklin Telegraph Co., and several others; and in the Washington office, Mr. Lines, of the Postoffice Department, and Capt. Howgate, U. S. Signal Corps, and others.

The matter transmitted was the President's late message, with the Spanish protocol attached, numbering 11,130 words; it having been selected in consequence of the declaration that its transmission over eight wires by the Western Union Company, on December 24, 1873, in 70 minutes, was a feat unparalleled in telegraphy. The work commenced in Washington at 5.39 p. m. The document was copied complete in New York at 6.48, p. m. occupying in all but 69 minutes, as against 70 minutes, the time consumed by the W. U. Co. The average time was 55½ minutes, as against 59 minutes by the W. U. Co. The Automatic used but one wire; the W. U. Co. used eight. The Automatic used ten perforators, thirteen copyists, and two Morse operators, as against sixteen expert Morse operators by the W. U.; the average pay of perforators and copyists being \$40 per month.

We have received a circular giving the details of the experiment and give some of them, as people are interested in knowing whether the capacity and economy of the new system are to be to their benefit. Mr. E. H. Johnson, the general manager, makes a statement of the trial, from which we condense the following: Matter transmitted, 11,130 words; length of circuit, 281 miles; conductors used, one wire. *Labor.* New York—One Morse operator, and thirteen copying operatives; Washington—one Morse operator, and ten perforating operatives. Total, twenty-five operatives.

Time. Washington—Perforating commenced, 5.39; and completed, 6.24½; New York—copying commenced, 5.42; completed, 6.48. Total time, sixty-nine minutes.

Cost. Morse operators, \$100 per month; automatic operatives, \$40 per month.

The characters were legible and well defined; and were copied with facility. The average time the operatives were at work was 45½ minutes, making an average per operative, per minute, of 25 words. The average time of copyists was 50 minutes, making an average per copyist, per minute, of 17 words. The average time occupied by the Automatic was 55½ minutes. The average time occupied by the Western Union Company was 59 minutes. No attempt was made to attain a high speed of transmission on this occasion, as that point had already been proved in the presence of the Hon. John A. Cresswell, Postmaster-General, and numerous other gentlemen, including Senators and Representatives in Congress, on the evening of December 11th, 1873, when they transmitted some twelve thousand words over one wire from Washington to New York in twenty-two and a half minutes. The manager thinks that with the experience gained at this trial, they could readily dispense with at least two perforators and three copyists, and yet perform an equal amount of work.

MINES are said to be leaving Pioche for new diggings. There is considerable talk among them of San Juan and the Sticken country, and quite a number will go to both these localities.

The Eberhardt and Aurora mill is working, notwithstanding the inclemency of the weather and bad roads.

Antimony Mining and Smelting in Canada.

By ARTHUR F. WENDT, E. M., in *London Mining Journal*.

Antimony was discovered in York county, New Brunswick, about the year 1863. The ore occurs in the Lower Silurian slates, in a low ridge running nearly southeast and northwest. Two miles east of the mines the slate abuts against the junction of the granite area, and a small and shallow outlier of the Carboniferous system. The granite underlies the slates, which in turn seem to underlie the conglomerates and coarse sandstones of the Carboniferous. The ore is stibnite, and occurs in segregated veins with distinct clay selvages, conformable with the general stratification of the country; the strike is about north 55° east, and the dip varies from 30° to 50°. The gangue consists of compact white quartz or a bluish slate, highly charged with numerous small crystals of iron pyrites. In addition a conchy quartz and white and grey calcite have been found as vein-stone in two of the mines. The walls of the veins are very irregular, yet well defined, the hanging wall often showing signs of slicken-sides. In width the vein varies considerably, ranging from a few inches to six feet, thus forming a series of pockets, often connected only by barren vein-stone. Of three mines opened on different veins only one is at present in active operation.

Mining is Conducted

By the system of long wall stoping, the vein having been uncovered, and stoping begun for nearly 200 feet. The ore, as delivered to the spalling floors, contains an average of 10 per cent. of stibnite. Besides the millstone and sterile material, some No. 1 ore, fit for the smelting works, is obtained in this operation. The mill ore is fed by hand into a Blake's crusher, which delivers the crushed ore to a pair of primitive rolls. Their diameter and width is 15 in., and their surface is formed of three wrought-iron bands shrunk on the cast-iron core of the rolls. The second roll revolves by friction, and is kept in contact with the first by a weight, acting through a combination of levers. The natural result of this disposition is an unnecessarily large production of fine ore, and since the gangue is harder than the ore, an enrichment of the finely crushed grades at the expense of the coarse ore, and a consequent large proportion of loss.

Concentration

Was formerly effected by a Krom air-jig, but this method has been abandoned as unsatisfactory. As the merits of this machine have lately been the subject of a lively discussion amongst members of the mining profession, it may not be out of place to state some results obtained by its use, and their comparison with wet concentration. I wish the reader to hear in mind that I was unacquainted with the machine, except by the description given in Mr. Krom's pamphlet, and that I believe better results could have been obtained if the grading of the ore had been more perfect and the mill a trifle less shaky. The ore was graded by wire-cloth sieves of 8, 25 and 60 meshes to the inch; all material not passing through the coarsest sieve was continually returned to the rolls by an elevator. The grade of ore between 25 and 60 in. gave the best results, and contained by assay 12.15 per cent. of metallic antimony. The ore was passed through the machine three times, and the rich stuff then assayed 30.62 per cent. of antimony. The tailings of the two last concentrations were re-jigged and the product added to the original ore. The total tailings thereupon assayed 3.25 per cent. of antimony. The product of the machine varied from 400 to 600 pounds per day, and required the attendance of one man. This result is certainly not very brilliant, but it was the evident inability of the jig to deal with the fine ore passed through the 60-mesh sieve that finally condemned it in the eyes of the company. A simple form of water concentration was then resorted to. The crushed ore is fed, without previous sizing, into an inclined sluice. At its bottom a rectangular box, the trunk box, receives the washed ore; the sludge and slime is carried off by the water and deposited in a number of large tubs. The washed ore is immediately jigged in a 22 by 36 in. sieve, hung in a large box of water, and supported by a lever, the long arm of which is set in motion by a cam on a lineshaft. The sieves receive 110 strokes per minute. Their bottoms are made of stout parallel wires, on which rest the hedging of coarse lumps of stibnite. In four or five minutes the ore is jigged, the sieve raised out of the water, the tailings scraped off by the workman, and finally three or four shovels full of fresh ore added. Previous to every third or fourth addition the chatts, a layer of stibnite and gangue in the same pieces, are scraped off, rerolled and jigged. The superfluous bedding, which is fit for smelting, is also occasionally removed. When the jig box is full of ore the water is drained out and the ore again trunked and jigged. The original ore assayed 7.31 per cent. of antimony, the first concentration enriched it to 21.8 per cent., the second to 29.75, and the third to 66.35 per cent. of metal. The chatts assayed 4.57 per cent. and the tailings .99 per cent. The result of 23 days' work of one jig was 2,347 pounds sieve ore (hedding), and 4,220 pounds jigged ore, or at the rate of 285 pounds a day. The ore contains by analysis 12.7 per cent. of moisture, hence one jig produces 250 pounds dry 60 per cent. ore in 10 hours. Since one man can readily tend two jigs, he will produce as much concentrated ore of a higher yield as with a Krom concentrator, and will achieve this end from poorer ore, with a smaller loss and with cheaper machinery.

The results obtained by Mr. Krom's machine could no doubt be greatly improved, but I do not believe it will ever be able to separate ore and rock as completely or cheaply as a plunger-jig, nor do I believe that in any form of dry concentration iron pyrites of 4.9 sp. gr. can be separated from stibnite of 4.7 sp. gr., which result I have obtained on a Rittinger's continuous shaking table. Numerous mines are so situated as to make wet concentration an impossibility; to these the air concentrator will be a boon that can not be too highly prized, and its inventor and his labors to perfect his machine deserve the warmest approbation.

The Smelting is Accomplished

By the roasting and reduction process, entirely similar to the method adopted by the Septèmes Works in France, in 1855. The only novel point is the improvement introduced by the writer in refining and smelting the metal in one operation. The concentrated ore is roasted in a reverberatory 40 ft. long and 9 ft. wide. The height in the center is 18 in., the arch having 6 in. spring. The fire-place is 2 ft. wide, and 10 doors are ranged diagonally opposite on the two sides of the furnace.

The fire-brick is 6 in. high and 12 in. wide, and the flue and stack 12x16 in. interior dimension. The furnace holds five charges; three of 600 lbs. of wet ore being introduced and drawn every 24 hours. The ore, therefore, remains 40 hours in the furnace, and is heated nearly to fusion for two hours previous to drawing. To prevent its agglomeration the ore is rumbled every five to ten minutes. The loss of metal by roasting is 7.5 per cent., which is volatilized as sulphide of antimony, as, with proper working, the heat is not high enough to oxidize the fume. This operation produces a dull greyish-yellow mixture of oxide, containing a variable amount of oxisulphide of antimony. The consumption of fuel is only $\frac{1}{4}$ cord of wood in 24 hours.

The Smelting Furnace

Is a small reverberatory, connected with a number of dnt chambers for collecting the volatilized and oxidised metal. The crucible of the furnace is lined with fire-clay, and is 5 feet diameter and 18 in. deep. The fire-brick is 16 in. wide, the throat 18 by 24 in., and the grate 2 feet wide. About $\frac{1}{2}$ cord of wood is burned to each charge. The flux used in smelting is a crude sulphate of soda in the form of salt cakes, and the charge usually employed consists of 500 lbs. of roasted ore, 100 lbs. salt cake, and 75 lbs. hard wood charcoal, all in a coarse powder. The ore is mixed with 75 lbs. of charcoal and spread evenly in the red-hot furnace, it is then covered by a mixture of salt cake and the rest of the charcoal. The fire is immediately urged, and soon a violent reaction between the salt cake and charcoal sets in, carbonate of soda is formed, and sulphurous acid and carbonic oxide liberated. A fused layer is thus formed, which protects the reduced metal and fluxes the silicic acid of the gangue as well as helping in the reduction. In about four hours the furnace is at a bright red heat, approaching whiteness, and the whole mass is in fusion and active ebullition, the cerionio oxide penetrating the layer of slag and burning with a green flame. The charge is now repeatedly well stirred, until it is in quiet fusion, at which point it is kept for half an hour, to allow all the metal to settle. The fire is then let down and the doors placed ajar till the surface of the slag is at a dull red heat, and has become thick and pasty. It can then be drawn out of the furnace with a pair of prongs, or a rake. Immediately on its removal the refining slag, a mixture of 25 lbs. salt cake and 10 lbs. charcoal, is thrown on the metal, and the fire again strongly urged. Carbonate and sulphide of soda are produced, which sulphurize and scoriafy the impurities in the metal. In $\frac{1}{4}$ hour the slag is in quiet fusion and must be perfectly liquid, running like water. The metal is immediately ledled into iron dishes holding 25 lbs., care being taken to dip enough slag to cover it about $\frac{1}{2}$ in. thick, and not to let the antimony solidify in the dish until the latter is full. The slag ought to remain soft after the metal is solidified, and must not be broken off till perfectly cold. The metal obtained by this process is nearly chemically pure, and to this it owes its beautiful crystalline structure or ster and its high price in the market.

The Smelting Slag

Has a porphyritic appearance and is mainly silicate of soda holding quartz and slat in suspension. The refining slag seems to be composed principally of a double sulphide of sodium and antimony, dissolved in, or mixed with, carbonate of soda. It contains 15 per cent. of antimony, which is extracted by smelting 500 lbs. of slag with 100 lbs. of iron. A slag is produced therefrom that contains only a trace of antimony. From experiments made with the smelting slag I am convinced that the antimony could be profitably extracted by smelting it with iron ore and coal in a low shaft furnace, as it was possible to reduce the metal in the metal in the reverberatory, but not to render the slag liquid enough to allow the antimony to settle. The fine dust obtained is a pure oxide of antimony and is smelted exactly like the ore. In conclusion, I may say that this method of smelting antimony is cheaper than any other known method; no crucible breakage has to be charged, nor is the quantity of fuel or labor nearly as large as in the old English crucible process. With well built furnaces the loss of metal need not exceed 12 to 15 per cent., which amount is lost in crucible smelting, and the metal produced is of a much superior quality.

Irish Mining Operations.

While so much is written relative to the mining operations in the various districts in England and Scotland, little is generally published in England of what takes place in Ireland, where the works are of equal importance and value to those of Great Britain. The question of how best to utilise the mineral resources of Ireland has long been a much-vexed one; and yet, when we review the various reports just now to hand from the Irish collieries and mines, we are at a loss to understand why it should be so.

From a few accounts of the working of the past year, we learn that during the last six months 1,302 tons of copper ore were raised at the Knockmahon mines, in the county of Waterford, as compared with 1,330 tons in the half-year previous. The loss upon the operations amounted to £882 4s. 3d., after an expenditure of £734 on explorations at Kilduene and other localities. The improved prospects of the Lugganure lead mines have so far been realized, that the operations have resulted in the raising of increased quantities of ore. A new lode, the "Hero," has been proved to a depth of fifty fathoms, and another promising lode has been discovered in the neighborhood. In the last six months the winnings were 682 tons, as compared with 498 tons in the preceding six months. The quantity of lead ore delivered to the Ballycorus Smelting Works, County Dublin, was 676 tons, of the value of £1,455, the profit on which was £921. The operations in the various branches of lead ore smelting and lead manufacture at the Ballycorus works have resulted in a profit of £1,516, whilst in the smelting of silver ores there has been a loss of £2,242.

The new lease of the Slievordagh Collieries (Cork) having been obtained, a pit is now being sunk in connection with Coalbrook Colliery, which has already reached a considerable depth, and which will, it is calculated, be completed in about a year. The output of coal and culm at the Slievordagh Collieries has amounted to 20,027 tons, against 19,512 tons in the corresponding six months of 1872. At the Dulkallow Collieries, the troublesome and expensive operation of unwatering and securing ventilation has been completed, and the usual raising of coal and culm has been resumed. The quantity of coal and culm brought to hawk has reached 2,930 tons, which, though less than in the previous half-year, is fairly demonstrative of the great value of these collieries.

Taken as a whole, the reports from Ireland are satisfactory; and, should capital be brought to bear in the development of the mineral wealth it contains, a marked progress and beneficial result would undoubtedly be the reward of the enterprise.—*Iron*.

A Miner's Views on Quicksilver Bills.

A practical miner favors us with his views on the bill lately introduced by Mr. Gilman in the Assembly, as follows: It is one that demands the attention of the producer as well as the consumer. Quicksilver is an article that men must have, no matter what the price. Gilman's bill proposes to regulate the price. Now I contend that the only way and the only means by which the price can be regulated, is by the co-operation of producer and consumer. But to show you the many obstacles thrown in the way of the miner, I will illustrate one case of my personal knowledge—one in many thousands. Two miles from Cloverdale there is a cinnabar lode, called the "Live Oak," located last September, and owned by Messrs. Dougherty, Walker & Co. There is a shaft sunk 40 feet, a tunnel 55 feet to strike the ledge at a depth of 40 feet. A cross-cut has been started, and they are now going through ore that assays from one to two per cent. There are several mines in this locality, where the prospect is equally as good as the "Live Oak," but owing to the winter setting in, have not been prospected so well. The owners of this mine have tried to effect a sale. So far they have failed—and why? Because the "middlemen" have formed a ring. The "middlemen" are "curbstone brokers" that have no legitimate business, but make money out of other peoples' misfortunes, and it takes a miner with a small fortune to do anything with them. They keep dilly-dallying along day after day, until the party selling the mine is either "broke" or disgusted, when from sheer poverty he will sell at any price. The mine is then sold to the third party, or capitalist, the "middlemen" making all the money, while the prospector gets virtually nothing. Now I propose that mine owners, mill men, and corporations generally, using quicksilver, assist the cinnabar miners who are poor. Buy their mines, erect suitable works, and manufacture their own quicksilver. If they would adopt this plan they need not ask legislation on the subject.

It is a universal fact that prospectors are always poor. If they were not, we would have no monopolies to dictate the price of quicksilver or any other product of the mines. The Virginia City *Chronicle* advances a capital idea, that of a unity among prospectors—in fact a Grange—which should be endorsed by all miners. Let them unite and form a general fund, and when necessary assist members until they have attained their object, provided it is honorable, in the sale of a mine.

The Raymond and Ely Mine.

In a late issue the *Pioche Record* speaks of the Raymond & Ely mine as follows: Main shaft down 1,110 feet. The level running from the tenth station is 172 feet from the ninth station; the work on the ledge is being done with whims, and has progressed 45 feet in good ore. The eighth level is being run to the ledge, and is within 15 feet of it. The seventh level contains splendid ore, which can be worked to much better advantage than any other, the matter being in a powdered state. Between the fifth and sixth levels no work is being done. Between the fourth and fifth levels a superior quality of ore is being taken out. The whole amount of ore extracted daily is from 70 to 80 tons, and the working force is about 170 men. This mine is worked better than any other mine in Nevada. The railroad track runs under the ore house, so that no labor is required to load the cars, a double track, turn-table, switches and every facility for rapid work being provided. Shipments by rail for the week were 855 tons of ore. The foregoing report was furnished by the forsmen, Thomas Andrews. The motive power of the Raymond & Ely mine consists of two engines—one 19-inch cylinder by 24-inch stroke, which runs the cage in the west shaft; the other, lately erected, the east cage, a double-decker, weighing fifteen hundred pounds—with complement of cars loaded six thousand pounds. This beautiful piece of mechanism, displaying the master-hand of genius in the design and erection, was planned by Mr. Geo. E. Ames, and was constructed by Booth & Co., of San Francisco. It is of 80-horse power, 20-inch cylinder and 36-inch stroke, with balance valve in the brake, and every improvement that steam engineering of modern times suggests. The steam supply is furnished by two sets of boilers, used alternately, to allow cleaning and repairing without stopping the works, two 56 inches in diameter and two 48 inches in diameter, 16 feet long, and built at Marysville from design of Mr. Ames. They are furnished with Richardson's automatic safety valves, out of control of engineers or firemen when set and supplied by a Knowles' steam pump, which can also be used in case of fire. There are 1,700 feet of wire cable, with engine capacity to sink 2,000 feet.

Steam Pipes in Mines.

It is a frequent arrangement now-a-days, says *Iron*, to conduct steam through long stretches of pipes, lagged and unlagged. This is especially the case in the present system of mine drainage where the engine and pump are combined, and placed at the bottom of the mine close to the water. The steam is then frequently taken many thousand yards from boilers on the surface to pumps underground.

The inevitable condensation of some of the steam forms a considerable accumulation of water in the pipes at the engine, which causes the cylinder to prime heavily, and it is therefore very injurious unless removed.

To effect this, a frequent method is to place a water-cock in a receiver at the lowest point in the line of piping. This cock is then left constantly open, the condensed water with a large volume of steam continually blowing off to waste. To avoid this waste of steam a very ingenious French invention has been introduced to pass off automatically all condensing steam with the least possible waste of live steam.

The appearance of the apparatus is that of a ball-valve oscillating on a trunnion in a cistern of water. The trunnion is hollow, with two passages. One admits the condensed water from the pipes into the hall of the cock when in its highest position. The ball now being filled with condensed water, sinks in the cistern, opening a communication with the live steam into the hall. The live steam thus admitted empties the hall of its contained water, the hall again rises, and is once more filled with condensed water from the pipes, and so on. The actual oscillations in practice are very small indeed, and the loss of steam not perceptible.

TRENCH MINE.—In conversation with Mr. Butsch, now in charge of the Trench mine, on White Pine Mountain, we learn that everything about the famous property is looking exceedingly well. Although the roads are in such condition as to render the shipment of ores impossible, work on the mine is being constantly pushed ahead, developing large and rich lodes of ore. Butsch says that every day's work reveals more and more palpably the fact of the property proving one of the most valuable in the district, and he is satisfied a 20-stamp mill can be run on the product. We learn that negotiations are in progress having in view either a consolidation with the Monte Cristo mill, situate about two miles from the mine, or a lease of the same. It has always appeared to us a needless expenditure of many dollars in taking the ores from the Trench to Eureka, some forty miles distant, when a new 20-stamp mill stands idle at their very door, capable of crushing rock with as good results as can be obtained elsewhere. It is earnestly to be hoped that the coming spring will cause a change in the management of affairs as regards the working of the really valuable ore obtained in the Trench mine. Tom. Robinson, the superintendent, is now below, endeavoring to make arrangements for vigorous working the coming season.—*White Pine News*.

The San Juan Country.

The *Pioche Record* contains the following article: So much has been said and written in favor of the San Juan country and its vast riches, that it seemed almost a waste of time and effort to attempt to resist the tide which appeared to be sweeping everybody and everything in its current. But when we give all the information—good and bad—in relation to the country, our duty to the public is performed; and, if those who go, in spite of our protests, meet disappointment and misfortune, the fault will not be ours. So far, nothing has been received in regard to San Juan that did not paint the country and its resources in rose-colored tints. So far, the effort has been to restrain people from going there, at least, until May; but from information received yesterday from Mr. Richard J. Pryke, who has just arrived here from Denver, we are decidedly of the opinion that the chances will be altogether better a year or two or three hence than now. Our informant does not question that there are immense deposits of silver in the San Juan district, and that leads can be found in abundance. But the difficulty now is that the country is wholly without machinery to work the mines; and there will not, in the very nature of things, be employment for those who hope to labor for wages. There is no settlement within 120 miles, with no wagon road for 60 miles. All supplies must be brought the year round a distance of from 120 to 200 miles; and, for eight months in the year no work, not even prospecting, can be done. They have frosts there in July and August, and snow from September to May, inclusive. Snow slides in that country are terrific, coming down the steep mountain sides in such huge masses and with such irresistible force as to break down heavy trees as if they were but weeds—tearing them up by the roots and splitting them into kindling wood. "Seeing is believing," and Mr. Pryke having seen the country, and judged of its resources, took a sensible view of the situation, and so has concluded to await the time when the country shall be thoroughly prospected, and then purchase some mine already opened. He believes, however, that experienced miners, with capital to operate with, could, in the spring, lay the foundation for a fortune; but he urges all men of limited means to stay away from San Juan at present—to let well enough alone, and to husband their resources for a couple of years—and, then, if things look favorable, to try their fortunes in this promised Silverado.

Native California Coffee.

We were favored yesterday with a call from Mr. T. H. Kelingshy, at present he found at 315 Clay Street. Mr. F. has resided for many years in South America, where he became familiar with the coffee plant, its cultivation on the mountain, plain and valley, and the peculiarities incident to its growth. He states that at an elevation of from six to eight thousand feet above the sea, coffee is raised to perfection and in great quantity, without the necessity of providing shade for the plants as in the hot, lower valleys. It appears from this, that coffee does not require that extremely tropical climate to perfect its growth that many suppose; but that, given its proper elevation it is even more at home and thrives better wholly unprotected, than when forced to grow in a torrid climate under the shade of other trees, as is the practice in all very hot countries.

Now except as an introductory there is nothing of peculiar interest in the foregoing; but when we annex to it the fact, that in many of the foothill countries of the Sierras, at an elevation of from two to four thousand feet, the same genuine native coffee is found growing in perfection and considerable abundance, may be news to many a reader. That this is the case, there can be no question. Mr. F. has made the most careful investigation of the plant and its fruit, botanically and by the gathering, preparation and use of the seed for coffee-making.

In the first place the plant looks precisely like the coffee plant of other countries, with a slight difference in the form of its leaf. The fruit, which is the outer covering of the coffee seed, is the same in color, texture and taste as the cultivated varieties in Central and South America, and in every respect is the genuine coffee of commerce except in name—wild coffee. The shape of the berry when prepared for market is the same, except that the California variety is really larger and more completely perfect than most of the coffee of commerce and would be pronounced a superior article by the side of it.

Mr. F. is ready to produce further evidence of the genuineness of the product being veritable coffee, whenever any interested party shall apply. Now what hinders the extended culture, instead of the present destruction of this indigenous coffee? Why not plant the now almost useless thousands of acres of the foothill and mountain lands of the State with this native coffee, in the very zone, belt and altitude in which it is found growing wild and of course perfectly at home? We shall hope to hear of some one this spring, engaged in collecting a considerable plantation of young coffee trees from the counties of El Dorado, Amador, Toluca or Calaveras, in all of which this native coffee is found growing though sparingly, owing to its total destruction wherever the land is improved or used agriculturally.

Do We Use Sufficient Seed?

Of course every farmer is supposed to know how much seed wheat is required to the acre to produce the best yield; but does every farmer really know this? Has he repeatedly made test experiments on the same land fitted and sown at the same time and harvested and measured the product, or is his opinion mere guess work? The wheat fields of England produce as a whole average, more wheat to the acre than any other country.

Wheat has been grown on their lands for centuries with no diminution of product but rather an increase. Of course this has grown out of judicious rotation, the free use of manures and scientific culture. But does not this kind of culture include as well the quantity of seed sown to the acre, as its management in other respects? In taking up an English exchange, the "Farmer," we find that the first wheat seedlings in the fall, only a bushel of seed was given to the acre; that a month later two bushels were used, while the last sowings as many as four bushels to the acre were not uncommon.

We doubt very much whether our farmers make any such differences in the quantities of seed, as depending upon early or late sowing. Many sow more wheat on late sown ground, but do we ever make so great a difference as do the English in this regard? And if not, are we or they in the wrong in withholding, or needlessly sowing more seed, then will produce the best returns?

Early sown wheat tillers or multiplies its stalks from a single grain from six to ten-fold more than the latest sown, yet we would hardly venture to sow six times the usual quantity because it happened to be late sown. Still we believe it would pay our farmers this year—as they will probably be able to seed as late as as they please—to try on acre or two in different soils, with what would be termed very heavy sowing, amounting to at least double the usual quantity and carefully mark the result. We believe it would inure to their benefit.

New Inventions!

Of real merit, if brought plainly before the public when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the Press. Superior Engravings Made, at reasonable rates, by artists in this office. hp-tf

A NEW BOOK.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, \$10.50; in leather, \$12 (currency). Forwarded by mail for 60c. extra, by

POPULAR LECTURES.

Professor Neri's Lectures—No. 3.

[Especially Reported for the Press.]

Professor Neri delivered the third lecture of his series on Thursday evening of last week. The special branch of the subject treated on was

Galvanism,

The first and second lectures having been devoted respectively to frictional electricity and magnetism. This form of electricity, which affords the means of producing a steady force, by means of chemical action, was entirely unknown to the ancients. Its discovery only dates from 1790, and owes its origin to the accidental placing of a frog between the opposite poles of an electrical machine, when a series of startling convulsions was observed which excited the curiosity of Galvani, and induced a series of investigations, and finally led to the full development of the galvanic principle.

Galvani inferred the existence of electricity in the bodies of the frogs, and that it was decomposed at the junction of the nerves and muscles—thus developing the phenomena observed. Some even thought that the philosophy of life had been discovered. But Volta did not coincide with this theory, holding that the electricity was contained in the two metals which were brought in contact.

A Famous Controversy

Grew up between the experimenters and the two schools which arose in connection with this controversy. Neither, however, have been entirely correct. The phenomena were due neither to the nerves and muscles of themselves, nor the contact of the two metals alone, but to the aggregate of the whole. They were due to the chemical action induced in the liquids of the body of the frog or the animal by the contact of the two metals. Le Brun was the first to make this discovery and announce it to the world. Following out this idea, many new and ingenious experiments were resorted to, which finally led to another important discovery—that of

The Voltaic Pile,

Which was first announced to the world in March, 1800. One of these devices was shown to the audience, but somewhat more elegant and elaborate than that first devised by Volta, whose first effort consisted merely in placing together a series of silver and copper coins, each couple separated from its neighbor by a piece of cloth, moistened with acidulated water. He found that when he brought the two termini together, by means of two pieces of wire, that a sensible shock could be felt, which might be repeated as often as contact was broken or closed. This discovery created much sensation all over Europe, and was soon improved by Volta, himself, in the substitution of cups for plates of silver and copper, or zinc and copper. By multiplying these plates or cups the power may be increased to any desirable extent, and will continue until the acid in the battery becomes saturated with the zinc, which it decomposes. Of course the power disappears gradually, unless the strength of the acid is kept up by frequent renewals.

Various improvements on the galvanic or voltaic battery have made from time to time, the first of which was that of Daniells. Smee's battery is remarkable for its simplicity; but the most powerful and convenient battery is that devised by Grove, which is simply an improved modification of Daniell's. A modification of Groves' battery has been introduced by Bunsen, which is very popular in Europe. The galvanic current, even with a very feeble battery, is capable of supplying a very strong light. This fact was demonstrated by a large number of

Very Brilliant Experiments,

Which included also a demonstration of the comparative conductivity of the various metals. To show the latter, the current was caused to pass over a chain composed of alternate links of silver and platinum. While the latter glowed with heat, the former were not seen at all, owing to the facility with which the current passed over them. So intense was the heat produced that small pieces of wire were readily fused. While the current passed unobserved over a large wire, its passage over a small wire caused the iron to glow with heat. So intense is the electric heat that it is capable, not only of fusing, but also of volatilizing the most obdurate metals or even precious stones. Carbon in a peculiar condition of semiconduction is the only substance capable of resisting its action.

Effects on the Animal System.

When passed through the human or any other living animal body, the galvanic current produces great activity of the nerves, and is hence often beneficially applied as a remedial agent to the human system, but requires to be applied with great caution. Applied to a dead body it is capable of reproducing all the vital actions, even to respiration. Allusions were also made to the appalling effects of experiments often made on the bodies of executed criminals, where the lifeless remains are made to develop all the activities of actual life—writhing in contortions, rolling the eyes in horrible glare, moving of limbs, hands, etc.

Some very beautiful experiments were given of

The Electric Light.

Showing the manner in which it is produced, etc. This light is produced by employing small pointed pencils of carbon, as the terminal poles. When these two points or poles are made to approach each other, point to point, and the current is turned on from the battery, the passage of the same from the positive to the negative carbon point is attended with a much greater light than it is possible to produce with any other substance yet experimented with. So powerful and penetrating is this light that, when sufficiently elevated, it may be distinctly seen 200 miles. This light does not depend upon the presence of oxygen, as it may be produced as readily in vacuo as in the open air. Hence the facility with which it may be employed under water, requiring no air to sustain it. It may be so employed either in a water-tight glass globe or entirely exposed to contact with the water. In the latter case, however, the brilliancy is greatly reduced. This light may be usefully applied in many ways, as for light-houses, underground workings, photographic purposes, etc. The intensity of brilliancy is equal to about one-third that of a similar ray of light direct from the sun. The fourth lecture of the course was given on Thursday evening last,—the day on which we go to press,—and, of course, too late for a report to be given in this week's issue.

Collecting Assessments.

The decision rendered on Monday by Judge Morrison, in the case of Mowen vs. the Emerald Hill Mining Co., is so important to miners and stockholders in mining companies that we publish it in full:

This is an application to this Court for an injunction to restrain the Emerald Hill Mining Co. from collecting an assessment upon its stock; and the main and only ground relied upon which I think it necessary to notice is, that a previous assessment upon the stock of the company has not been fully paid.

It seems that the company holds its title to a certain portion, one-third, I believe, of its mining ground, under conveyances executed by Lawler, McGlynn, and Corine. This company was organized for the purpose of mining, buying and selling mines and mills, and mining property. Lawler executed a deed to the company, at the time of its organization, for a certain interest then owned by him in the mining grounds now claimed by the company. "For and in consideration of the stock to be assessed, and the covenants and agreements herein-after mentioned, on the part and in behalf of the said corporation, to be observed, kept, and performed," he deeds to the company certain interests in certain mines, which are described in the deed. There is a condition in the deed to this effect: "That the said corporation, in consideration of such sale, hereby agrees to issue, in the name of and to the said Peter W. Lawler, and deliver to him one-twelfth part of all the stock of said corporation, at all times pay at maturity all assessments or dues levied or to be levied upon said stock, or any part thereof, and forever to keep the said Lawler, and all persons to whom that stock may be delivered, or those by whom it may be held, free and harmless from any and all claims or demands to be made against him or them, or any of them, by reason of their holding or owning any of said stock so issued," etc.

It is contended by the learned counsel for the plaintiff in this case that the company had no power to make such a contract; that the contract is *ultra vires*; that it is against the policy of the law, and therefore is void. The facts are that the first assessment was paid by the other stockholders, and the amount of the assessment upon the shares of stock held by Lawler and others under these conveyances was charged up by the company on its books to the purchase account; and in this way, it is claimed, the assessment was paid. It is contended that if this party had paid over the amount of the assessment to the company, he would have been entitled to receive it back at once, as a part of the consideration for the deed from him to the company, and that the result would have been exactly the same as that produced in this case by charging up the amount of the assessment to the purchase account. That would have been done eventually if the money had been paid over by the holders of this stock, and then been returned to him; that the amount in the treasury and the ultimate result would have been the same; and that the law does not require the vain thing to be done of paying over the money with one hand and receiving it back with the other.

This is the most embarrassing question I have had to deal with since I have been on the Bench. The learned counsel for plaintiff has referred to a great many authorities; but, in my opinion, none of them are precisely in point, and none of them aid me in arriving at a correct solution of this difficult question. I have consulted the Judges of the Fifteenth and Nineteenth District Courts, and they differ in opinion as to the legality of this contract; one of them thinks that the contract is void, and the other is of the opinion that it is good. And I cannot say that I am now in as much doubt respecting this difficult question as I was when I first undertook the investigation of it. There is a condition in the deed to the effect that if

these assessments are not paid by the company, the title to the property shall revert to the grantor. The court is therefore asked to do something in the case, which, if done, may result in the loss of this property to the company, for the company cannot hold the property and refuse to pay the consideration for it. The court is also asked to stop—because that would be the effect of it—the operations of this company, and to arrest its business by injunction, in such a manner that it would be powerless to do anything.

If this were a clear case, the court would certainly enjoin the defendant from collecting this assessment, whatever the result might be. But where there is a doubt, as there is in this case, the court will consider the consequence of its action, and resolve that doubt in favor of the defendant. The conclusion at which I have arrived is by no means a satisfactory one to my mind; but it is the most satisfactory that I can reach after giving this case as much investigation as its importance demanded. The motion to dissolve the temporary injunction heretofore granted must be allowed.

We have received from Prof. J. W. Swinton the annual report of the public schools of Oakland for 1873.

PAIN-KILLER!

FOR OVER THIRTY YEARS

Perry Davis' Vegetable

PAIN KILLER

HAS BEEN TESTED IN EVERY VARIETY OF CLIMATE, AND BY ALMOST EVERY NATION KNOWN TO AMERICANS.

It is the constant companion and estimable friend of the missionary and the traveler, on sea and land, and no one should travel on our Lakes or Rivers without it.

It has been before the public over thirty years, and probably has a better and wider reputation than any other proprietary medicine of the present day. At this period there are but few unacquainted with the merits of the Pain-Killer; but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful whether used internally or externally, and it stands to-day unrivalled by all the great catalogue of family medicines. It is sufficient evidence of its virtues as a standard medicine to know that it is now used in all parts of the world and that its sale is constantly increasing. No curative agent has had such wide spread sale or given such universal satisfaction. It is a purely vegetable compound, and perfectly safe in unskillful hands.

After thirty years trial, it is still receiving the most unqualified testimonials to its virtues, from persons of the highest character and responsibility. Physicians of the first respectability, recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, &c., but for Dysentery or Cholera or any sort of Bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India, and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic Difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine.

Beware of all Imitations,

The Pain-Killer is sold by all respectable druggists throughout the United States and foreign countries.

Prices—25 cents, 50 cents and \$1 per bottle.

PERRY, DAVIS & SON, Proprietors,
No. 136 High street, Providence, R.I.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Feb 17, 1874.

FOR WEEK ENDING Feb. 3, 1874.

ROTARY WINNOWER.—Thos. H. Drury, Wheatland, Oregon.

ART OF TUNNELING.—De Witt C. Haskin, Vallejo, Cal.

COMBINED WALL PROTECTOR AND TOILET RACK.—Herman Borchardt, S. F., Cal.

TRUCK.—Andrew V. Smith, S. F., Cal.

REVERBERATORY FURNACE FOR ROASTING ORES.—Ernst Heilgendorfer, Belmont, Nevada.

EYE GLASS.—Louis A. Bertling, S. F., Cal.

VALVE FOR PUMPS.—W. D. Hooker, S. F., Cal.

MEDICINAL COMPOUND.—Emil C. Jurgensen, Portland, Oregon.

DENTAL APPARATUS FOR OBTAINING THE BITE.—Edgar O. Smith, Albany, Oregon.

"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

The Mining & Scientific Press,

Started in 1850, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi. As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 338 Montgomery street, S. F.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. McCARTY—General Agent.
A. O. KNOX, City Solicitor and Collecting Agent.
W. H. RATTENBURY—California.
J. C. EWING—San Mateo County, Cal.
J. W. RILEY—Monterey County.
CHAS. W. OTIS—Marin and Mendocino Counties.
O. M. DALY—San Joaquin County.
D. BRUNER—Sonoma County.
CHAS. T. BELL—Alameda, Santa Clara and Santa Cruz Counties.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores, without quick-silver, is liberally illustrated and contains full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, and the Extraction of Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO \$5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator. Price, \$6 in cloth; \$8 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 176 pages. Price, \$2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay Minerals. By Wm. M. Bassett. 1869. 128 pages, 114 pages. Printed and sold by Dewey & Co. Price, \$1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & CO., Mining and Scientific Press Office, S. F.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS.
Also, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & CO., Publishers, and Patent Agents, S. F.

No LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

SAN FRANCISCO METAL MARKET.

WEDNESDAY M. Feb. 13, 1874.

Metals generally are quiet. Brasses & Copper have declined 50c. Tin Plates are firmer. Cast Steel is in slightly better request. An exchange says that during the past year there has been a considerable increase in the use of American Lead for all purposes except roofing, and a corresponding decrease in the importation of ordinary foreign lead. While Missouri has produced a little more than in previous years, and Gen. A. its usual amount, the Nevada and Utah mines have been greatly developed. The percentage of Gold and Silver in the bullion produced by the two latter named Territories is so high that the Lead is of secondary consideration.

HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron.

Miners' Foundry and Machine Works,

CO-OPERATIVE,

First Street, bet. Howard and Folsom, SAN FRANCISCO

Machinery and Castings of all kinds.

HENDY'S IMPROVED CONCENTRATOR.

Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

JOSHUA HENDY, Esq.—Dear Sir—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ore can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.
I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, April 27, 1872.

JAS. H. CROSSMAN, M. E.

SAVING MONEY.—The report of O. C. Hewitt, Superintendent of the Keystone Consolidated mine, in Amador county, is to the effect that they have saved about \$5,000 per month by the abandonment of blankets and huddles and the use of Hendy's Concentrators. The Concentrators have been in use there about five months and of course give great satisfaction, as they have performed their work so well.—SCIENTIFIC PRESS, Jan. 10.

The Superintendent, O. C. Hewitt, reports that a saving of about \$5,000 per month is arrived at by the use of these Concentrators.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years:

EMPIRE MILL. (3 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (3 Concentrators).....	Grass Valley, Nevada County.
VULTURE CO. (3 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Owhee District, Idaho.
LUCY MINING CO. (3 Concentrators).....	Sonora, Mexico.
ST. PATRICK MILL. (2 Concentrators).....	Georgetown, El Dorado Co.
ST. LAWRENCE MILL. (2 Concentrators).....	Newcastle, Placer Co.
JULIAN MILL. (2 Concentrators).....	Newcastle, Placer Co.
KEYSTONE MILL. (2 Concentrators).....	Amador Co.

CAUTION—All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented April 17th, 1866, and May 19th, 1868."

For full description send for Circular. Orders or letters of enquiry, address,

JOSHUA HENDY, San Francisco.

Office and Works, 32 Fremont street.
